3. A cogent argument for immediate attention to the subject lies in the recent growth of the communistic movement in America. The laws of property which give stability to life and hope to the worker have never been so formidably attacked as within the past year. The chief argument against International Copyright—an argument which appeals not so much to the reason as to the indifference of legislators—is that the absence of copyright makes books cheap. But is not the League right in urging that this is in itself a communistic principle: that we may refuse protection to foreign property if the uncompensated appropriation of it be, as is alleged, for the public good? Reduce communism to its least common denominator, and it is simply wanting something for nothing—a sentiment at war with self-respect, and thus an element of weakness in any individual or nation. It is unbelievable that this sentiment should affect to any great extent the Congress of the United States, the curator of our national honor. And what obligation has Congress to give the people cheap books more than cheap beer? Let us hope that, in the coming political conflict with communism, when Senators and members of Congress shall rise from their seats to denounce it, this blot on the escutcheon will have been removed, so that there will be no occasion to say to them: “Let him that is without sin among you cast the first stone.”

How Prohibition Grows.

MOST Americans are as yet rather indifferent on the subject of the license or prohibition of the sale of intoxicating liquors. Either they see little of immediate importance in it, or they are waiting to see whether Prohibition can be enforced, if it is enacted into law;

or they are still content to adopt without much question whatever position their customary political party may see fit to take on the question. There is, however, an increasing number of persons whose minds are distinctly made up, who are pronounced Prohibitionists; and the fact that their numbers are increasing ought to make it interesting to consider the influences through which this increase is taking place. For these influences are quite different from those which affect the ordinary political fortunes of the country. Political parties usually find speeches and contagious enthusiasm good, but printed documents better; oratory and the printing-press are their legitimate weapons of warfare. How many men have been converted by a Prohibition speech or a Prohibition document? Very many, no doubt; but no extended investigation will be necessary to show that such conversions have been more commonly due to some organized effort of the manufacturers or vendors of intoxicating liquors to protect their own interests. When a National Brewers' Convention or a State Liquor Dealers' Protective Association, or any kindred body, interferes successfully in an election, or raises a fund for the legal or political protection of its interests, or passes a series of resolutions which seem calculated to act as a menace to doubtful voters, the telegraphic dispatches are not only carrying the news through the country, but are everywhere operating on the feelings of men hitherto uninterested, and preparing them to vote at the first opportunity against the "Liquor Interest." The results come in every variety of form. In most cases they probably produce only a feeling of anger against the party which has been the agent of the organization; in a smaller number there appears a somewhat vague willingness to appear as the public opponent of "the saloon in politics"; a still smaller number will account for the steady increase in the absolute Prohibition vote. But the process is the same in all, and almost any man can verify the statement of it within the sphere of his personal acquaintance.

The situation is a startling echo of some of the features of the anti-slavery contest. In that struggle, also, the attacked party was a body of men, not formally organized, but bound to common action by great common interests. Its consequent discipline gave it the ability to secure great initial advantages; but it never gained one of these without having its success reflected in a rise of the tide which opposed it. Its true policy was to seek sedulously the shelter of retirement from public view, and to sacrifice almost any advantage, however tempting, which would bring it into public collision with an opposition whose moral aspect could not but be respected, however troublesome it might be in practice. Such a policy was its only possible salvation or reprieve; and yet it was just the policy which was impossible of adoption as soon as the number of slaveholders ceased to be small. The larger it became, the more impossible was it to prevent organized or common action by a number of slaveholders so considerable as to force the bulk of their fellows, with or against their will, into reënforcing them; and so the struggle went on widening to its inevitable conclusion. Who can avoid seeing the parallel in the present case of the liquor-dealers? The larger their numbers become, the more difficult is it to check ambitious or heedless individuals in their efforts to precipitate pub-

lic conflicts which can operate only to add to the pronounced opposition. Organization means action; and every public action is but a step on the road to destruction. It does not follow that the parallel must necessarily be carried to the same conclusion. If the question is presented often and strongly enough, it may be taken as certain that the mass of voters at present uninterested will side against the liquor-dealers; an American people committed, after full deliberation, to the support of drunkenness, is hardly conceivable. But everything will depend on whether the stream of opposition is to remain a narrow torrent of absolute Prohibition, or is to spread out into the broad reservoir of high license and moral opposition to "the saloon."

The settlement of this final question will depend very much on the power, for it is a power, which is now engaged in the defense of the manufacture and sale of intoxicants in the United States. It may, if it will, make this a Prohibition country. Its best friends, if the expression be permissible, could not, to be sure, induce it to pursue the only policy which would insure it a peaceable, though unostentatious, existence; but its most eager enemies could not ask a more happy dispatch for it than will certainly come from a violent resistance. Buying legislatures is bad; buying voters by wholesale is worse; but to undertake to check the Prohibition movement by shooting its apostles or setting fire to their houses is simply suicidal. One such case in Iowa last summer probably made more Prohibition voters than all the Prohibition speeches up to date. Nothing but this policy is wanted to prevent Prohibition from ever thinning out into some modified remedy. It is not difficult at any time to prove "the saloon" to be an enemy of morality: let it now prove itself to be a public enemy, and the end will no longer be difficult to predict.

Much may be done by the Prohibitionists also to determine the final question. The common charge against them is that of unreasonableness. A very large measure of this criticism has certainly come from the anxiety of politicians that their party necessities or convenience shall rank as modifying circumstances, to be tenderly considered by the Prohibitionists, and from the refusal of the Prohibitionists to do anything of the sort. Quite apart from all this, however, is there not ground for the criticism in the frequent refusal of Prohibitionists to make allowance for the existence of universal suffrage, and for the absolute necessity of popular backing for laws? He who, having control of the destinies of a savage and drunken tribe, should first grant them universal suffrage, and then declare that he will accept from universal suffrage nothing but absolute Prohibition from the beginning, would be thought not reasonable, perhaps not sane. What is the difference when he merely finds universal suffrage in existence, instead of being himself its grantor? He must at least recognize its existence. If he cannot limit the right of suffrage for a time, he would do well, in either case, to accept from it the nearest approach to his final object which he can get from it, not making this an excuse for stopping his own work, but not balking his own work in advance by refusing to consider circumstances which will not cease to defy him simply because he ignores them. Why should not a sincere Prohibitionist accept from time to time the best he can get for the

state, without thereby giving up the special work in which he must always find success, that of forcing issues upon the "liquor interest"?

Still less rational is it to make up the issue against those who conscientiously hold that large communities may need different treatment from small ones; or against those who are possible converts even to extreme views—instead of against the "liquor interest"; or to attack opinion through the lowest methods of the boycotter, and to endeavor to gain a doubtful vote by denouncing its possessor in public

and private as a "friend of rum." And the lowest depth has been reached in those few cases in which the lawless methods of their worst opponents have been imitated, and violence has been resorted to as an agent in converting opinion. Opinion is not successfully controlled in that fashion. Neither pro-slavery nor anti-slavery men ever succeeded in so dealing with public opinion, least of all with American public opinion. It will yield to instinct, to persuasion, or to reason: it has never had anything but defiance for compulsion or menace.

OPEN LETTERS.

Greek and Latin—Shall they Stay or Go?

NOTHING stays settled. Everything flows. Here is the old question, ever new, of classical culture to be discussed again—and yet again.

I have been considering whether there is not a rational view of the matter in which, could we all get the true standing-place, we all might agree. Let us, point by point, see what are some of the things wherein, upon mere statement, without discussion, we shall generally concur.

First, we all know well enough that few, very few, college students learn their Latin and Greek so as to be able to read and understand text at sight. Nearly all graduates must puzzle out the meaning of their classic author with much recourse to lexicon; and at that it is not the majority that succeed swimmingly.

Secondly, for most of the practical purposes of life, it is not to be reckoned loss to a man than he cannot read Latin and Greek with vernacular facility. Except for a limited number of persons, Latin literature and Greek are far less profitable than the living literatures of to-day.

Thirdly, the best Greek and Latin works have all of them, or nearly all of them, been translated into English. Of the versions accessible, some at least are scarcely inferior, as literature, to their originals. I have just been reading "Thucydides" throughout in Mr. Jowett's translation; and I am ready to pronounce that there is therein little lost from the simplicity, the terseness, the point, of the Greek text; while assuredly even the best of our Greek scholars would feel that of clearness, smoothness, coherency, there was actually some gain—fallacious gain, perhaps, not a few might say. This praise is of Mr. Jowett's work considered as literature. That it represents faithfully the sense of the original is a merit which it shares with many translations from Greek that, considered as English literature, are far inferior. It is the indisputable fact that the substance of classic literature, whatever may be the value rightly placed upon that substance, is open to be secured by any English-reading person through the medium of his own tongue.

Do I seem thus to have been giving reasons why Greek and Latin should cease to be studied? Well, that has by no means been my purpose. Have I been pointing out imperfections that ought to be remedied in our ways of teaching and studying Greek and Latin? That also has been far from my aim. Perhaps

there are improved methods of classical education possible. Professor Shumway, with his admirable *Latine et Graece*, certainly thinks that there are. I hope we shall be willing to learn from him, if he can teach us.

I emphatically do not admit that Greek and Latin should be displaced, or replaced, in our schools. There is nothing suitable to replace them. Let them stand. But if they are removed, it cannot be for long. There will follow a revival of letters. But we cannot afford even an interregnum.

Why is the maintenance of the classics in their place as part of education desirable?

I answer, because the study of language is important, and to study language, *in* Latin and Greek, and *through* Latin and Greek, is the best method available. There is a strong set of tendency now toward studying things, as the phrase is, rather than words. The phrase itself is an argument—but it is an argument existing in words, and in words only. In short, the phrase is a capital instance of precisely what it ostensibly condemns; namely, barren practice in empty words. But not all dealing with words is such. For words are things, in a most true and most momentous sense. When we study words, if we study them right, we are studying things. And words are things eminently worth studying. They are the highest natural product of the highest animal in the circle of nature. To distinguish words, as it is often sought to distinguish them, from things, is unscientific.

But besides this, language is the great instrument of life. Nearly everything that men do in the world is done with the use of it, and I venture to say that there is no other single study whatever so immediately and so immensely practical, fruitful, as is the study of language. In this you undoubtedly could get along without Latin and Greek, and accomplish much that is desirable. But these tongues furnish us the best means existing to the study of language, and our own language is itself largely rooted in these ancient tongues. Once more, the process of translation is an unequaled exercise in two important activities of the human mind, namely, the obtaining and expressing of ideas through words.

The mind may be comparatively remiss in studying French and German. Of course, to acquire knowledge enough of them to use them freely for conversation is not easy, or rather, it takes time, and a condition not to be supplied in any scheme of general edu-

cation; that is, actual residence among people that speak the language studied. Replace Latin and Greek with French and German in our colleges, and the result would be only to produce a generation of smatterers in French and German, instead of smatterers in Latin and Greek. And there is something in the study of Latin and Greek that at least makes intellectual muscle, by providing occasion of effort to the mind; and I fear that the just-mentioned result, certain to follow the substitution of French and German, would not be solitary. I fear that easy-going drill in French and German would melt intellectual muscle, in place of making it.

While we Americans are discussing this question as if our minds were not yet made up, the Germans, across sea, having made up their minds through experiment, are restoring Latin and Greek to the schools from which the urgency of scientific propagandism had excluded them — convinced that no drill but drill in the ancient languages qualifies satisfactorily even for scientific study.

William C. Wilkinson.

The Cultivation of the Cantata.

A GREAT deal of attention is being paid to concerted vocal music and the oratorio, cantata and opera have everywhere found an appreciative and steadily increasing public. New oratorios written and composed by Americans are almost wholly unknown, and certainly are seldom, if ever, played in public. In opera a few new works are written, but the difficulty of getting them performed is so great that the task of writing them is thrown away. The cantata, occupying a middle place between the oratorio and opera, has been more successful, and there are a few cantatas written by Americans, and these few, such as they are, have been performed many times — one at least; Mr. Root's "Flower Queen" has been sung for twenty years or more and is still given in all parts of the country.

The cantata requires no scenery, costumes, or action, and this makes its performance less expensive and every way more easy. It is shorter and should be less difficult than the oratorio, and this is also in its favor. The original form of the cantata appears to have been a series of arias and recitations for a single voice. As it is now written, it is practically a short oratorio or an opera without action, and based upon either a theme from the Scriptures or upon some poem.

Under our present ruinous system of international copyright, or want of it, the American composer is helpless against the flood of music from Europe. Why should he write a cantata? The choral societies will not sing it because they can get foreign works without paying for the right of performance. This state of affairs raises the question why the Handel and Haydn Society of Boston and the Oratorio societies of New York and others do not do something to encourage American composers and writers.

In the first place, the words of the cantata must be obtained. To do this, let them offer a prize, a worthy one — say five hundred or one thousand dollars. Let the writers select their own subjects and choose their own manner of treating the theme, stipulating only that the work shall be of a convenient length for one performance or part of one performance. In other words,

the work should not demand, when fully set to music, more than one hour for its performance unless in two or more parts. Let a committee examine these new cantata librettos and award the prize, the work then to become the property of the society. At least, the right of performance should belong to the society, even if the writer is permitted to publish the work in book form. The right of performance being the property of the society, there would be no difficulty in recovering the cost of the competition in after performances of the finished work.

Having secured the words of the cantata and protected it by copyright, a few copies should be cheaply printed, and a second prize offered for its musical setting. Use the printed copies to send to composers desiring to compete for the prize. The prize for the music should be, if possible, much larger than for the words, for the work of composing the music is vastly greater than the work of writing the words. The musical setting should be only a vocal and piano score, and when all the different versions and settings are in, they should be played by a competent performer, with perhaps some vocal assistance, before the committee who will award the prize, or in some way they should be examined by competent critics and the prize fairly placed, because on this depends much of the financial success of the venture.

The prize for the music having been awarded, the right of performance should belong to the society, and they may proceed to put the new work in rehearsal, with or without the orchestra (and a piano is generally quite enough for the first trials), and advertise a public performance of their new work. Curiosity alone will be sufficient to fill the concert-room the first time, and with proper management the larger part of the cost of the competition and prizes might be recouped to the society. If, as there is every reason to suppose it might, the work should become a success, it is a good piece of property. Having the sole right of performance, the society could command the market on its hearing and on its rental to other societies for public performance. In case the society felt unable to offer cash prices to the writer and composer, they could give a bond agreeing to pay a royalty on every performance wherever given in the United States so long as the copyright should be valid.

The cantata must be simple and direct in theme, and the music must be adapted to a mixed chorus and a few, say from four to eight, solo voices. The subject, the words, and even the treatment of the words, must be wholly subservient to the music. The story, whether sacred or profane, should lend itself to musical treatment, or the composer will be hampered, and perhaps unwilling to set it. The story should always be given to the solo voices, the chorus acting the part of commentators or sympathizing observers, or friends, or the populace in the background, who reflect the story or enhance its strong points. The most important parts of the story must invariably be recited, and not sung, because in singing the thread of the story is invariably lost, and the listener becomes confused and disappointed, and in trying to catch the thread of the story loses much of the pleasure in the performance. The story being told without action, it must be very simple, clear, logical, and consistent. These are a few of the limitations; outside of them the writer is free

to do what he pleases, have single or double chorus, male or female chorus, have few or many characters (within the limits mentioned), and indulge in any arrangement of the numbers he thinks effective.

To the musician a really fine cantata offers a most inspiring theme, and, if he is satisfied with the work and it suits his poetic temperament and musical feeling, he may spend on it the best efforts of his genius. Even while we have so few chances to have a cantata performed or even published, there is still a wide field for good work, particularly in short, easy cantatas for the use of children. The great difficulty is the want of libretto writers, or persons who can create or adapt a good story, put it into musical and singable verse, and fit it to the wants and limitations of our choral societies. The wonder is that our poets have not thought it worth while to enter this admirable and sometime to become profitable field of literature.

Charles Barnard.

Shall Young Men go to Vassar? If not, Why Not?

ARGUMENTUM AD HOMINEM — FEMINAMQUE.

WHEN Antalcidas heard that a eulogy had been written upon Hercules, he said: "Who blames him then? Are we not all friends of Hercules?"

And so, through two-thirds of Professor Sill's article in the June CENTURY, entitled, "Shall Women go to College?" I kept saying, Who doubts it then? There are Vassar and Smith and Wellesley and Hellmuth and Bryn Mawr. By all means let women go to college and learn there all it is possible to know of science, literature, and art.

But when it finally leaked out that it was colleges *for men* to which he would have women admitted, I changed my question and said, Why then shouldn't young men go to Vassar?

This argument will doubtless convince the Professor that I "fail to appreciate the gravity of the subject"; but if it makes Vassar a nunnery and Yale a monastery, the girls of the one and the boys of the other will be logically amused at the discovery.

C. S. Percival.

Lincoln in the South.

IN the spring of 1865, during the armistice between Johnston and Sherman, I had gone from camp into Atlanta to learn the news. Senator Wigfall of Texas was in Atlanta, on his way, I think, to the Trans-Mississippi. I was in the rooms of the commandant of the post with some gentlemen, listening to the interesting conversation of Wigfall, when the news of the assassination of Lincoln was brought in. The words of Wigfall and the impression produced by the news upon those present — all Confederate soldiers — so impressed me that I wrote his expressions down in my note-book the same day. An impressive silence of some moments was broken by Wigfall: "Gentlemen, I am — sorry for this. It is the greatest misfortune that could have befallen the South at this time. I knew Abe Lincoln, and, with all his faults, he had a kind heart; but as for Andy Johnson—" Here he assumed an expression of intense hate and brought his clenched

fist with force upon the table — but what he added is too profane to print in these pages.

FRANKFORT, KY., 1886.

J. R. P.

In this connection we quote from the article by the Ex-Confederate General Longstreet in THE CENTURY for July, 1885: "Without doubt the greatest man of rebellion times, the one matchless among forty millions for the peculiar difficulties of the period, was Abraham Lincoln."—EDITOR.

Liszt and David.

IN an article on Liszt in the September number of THE CENTURY magazine, an incident is related, which, if it took place as represented there, casts a slur on the memory and name of my father, Ferdinand David. Between Liszt and him—in spite of deep-going differences of opinion on musical matters—a close personal friendship and frequent musical intercourse existed for many years up to my father's death in 1873. My father had the greatest admiration for Liszt's phenomenal talent, and I remember him frequently, and many years before the date of the alleged scene at Berka, enlarging on Liszt's almost miraculous powers of reading at sight the most complicated scores and of deciphering the most crabbed manuscripts. Now, any one acquainted with the unpretentious and simple style of the piano accompaniments for my father's violin compositions cannot fail to see that any remark made by him to Liszt on the difficulties of such an accompaniment could only have been made by way of a little fun; and that Liszt, quickest of men, should have taken it seriously appears to me an absurd assumption. That a third person—the one who related the incident to the writer of the article in your magazine—should not have *seen* the joke is, of course, quite possible.

Nothing could better illustrate my father's relations to Liszt than the following letter, which he addressed to him on the night after a concert in which Liszt had met as a composer with a demonstratively hostile reception on the part of the audience of the Leipzig Gewandhaus Concerts. The German autograph, of which I add an English translation, is in my possession.

Yours faithfully,

UPPINGHAM, RUTLANDSHIRE, ENGLAND. *Paul David.*

LEIPZIG, 26 Feb., '57., 10 o'clock night.

Before going to bed let me render to you, my very honored friend, the thanks I owe you for this evening, you have once more in this concert-affair so completely proved yourself the thorough gentleman* and high-minded artist. That is not saying anything new about you, but it gives to me, your old friend, satisfaction to repeat old things.

I remain forever your gratefully devoted,

F. LISZT.

* Liszt uses the English term: "gentleman."—P. D.

BRIC-À-BRAC.

EQUAL TO THE EMERGENCY.

Hebe: "Unc' Isrul, mammy say, huccome de milk so watery on top in de mornin'?"

Patriarch: "Tell you' mammy dat's de bes' sort o' milk; dat's de dew on it — de cows been layin' in de dew."

Hebe: "An' she tell me to ax you what meck it so blue."

Patriarch: "You ax your mammy what meck she so black!"

The Coupon Letter of Introduction.

THE interchange of letters of introduction between old friends, by which valuable acquaintances are added to the list, is a great blessing, and in good hands these letters have, no doubt, been the beginning of many a warm friendship; but, like all other blessings, it has been greatly abused. I have been the recipient of letters, presented by tourists, which, it was easy to see, had been wrung from some sand-bagged friend of mine — letters with sobs between the lines, letters punctuated with invisible signals, calling upon me to

remember that the bearer had looked over the writer's shoulder as each sentence grew into a polite prevarication.

To those who are in the habit of giving hearty letters of introduction and indorsement to casual acquaintances, I desire to say that I am perfecting a system by which the drugged and kidnapped writer of a style of assumed sincerity and bogus hilarity will be thoroughly protected. Let me explain briefly and then illustrate my method.

A casual acquaintance, who has met you, say four or five times, and who feels thoroughly intimate with

you, calling you by the name that no one uses but your wife, approaches you with an air of confidence that betrays his utter ignorance of himself, and asks for a letter of introduction (in the same serious vein in which one asks for a match). You are already provided with my numbered Introductory Letter Pad. You write the letter of introduction on a sheet numbered to correspond with a letter of advice mailed simultaneously to the person who is to submit to the letter of introduction.

For instance, a young man, inclined to be "fresh," enters your office or library, and states that he is going abroad. He has learned that you are intimate with Dom Pedro of Brazil. Perhaps you have conveyed that idea unintentionally while in the young man's presence at some time. So now he asks the trifling favor of a letter of introduction to the Emperor. He is going to see the President and Cabinet and the members of the Supreme Court before he leaves this country, and when he goes to South America he naturally wants to meet Dom Pedro. So you fill out the right-hand end or coupon of the sheet as follows:

[*International Introductory Letter System, Form Z 23.*]

No. B 135,986. NEW YORK, Dec. 25, 1886.

SIR: You will please honor this letter of introduction in accordance with the terms of a certain letter of advice numbered as above, and bearing even date herewith, mailed to you this day, and oblige, Yours, etc.,

A. B.

The young man goes abroad with this letter inclosed in a maroon alligator-skin pocket-book, and when he arrives in Brazil he finds that the way has been paved for him by the following letter of advice:

[*International Introductory Letter System, Form Z 23.*]

No. B 135,986. NEW YORK, Dec. 25, 1886.

YOUR MAJESTY: Mr. W——, a young man with great assurance and a maroon-colored alligator-skin pocket-book, bearing a letter of introduction to you numbered as above, is now at large. He will visit Europe for a few weeks, after which he will tour about South America. He will make a specialty of volcanoes and monarchs.

He will offer to exchange photographs with you, but you must use your own judgment about complying with this request. Do not allow this letter to influence you in the matter.

You will readily recognize him by the wonderful confidence which he has in himself, and which is not shared by those who know him here.

He is a fluent conversationalist, and can talk for hours without fatigue to himself.

You will find it very difficult to wound his feelings, but there would be no harm in trying.

Should you get this letter in time, you might do as you thought best in the matter of quarantine. Some foreign powers are doing that way.

Mr. W—— has met a great many prominent people in this country. What this country needs is more free trade on the high seas and better protection for its prominent people.

I have tried to be conservative in what I have said here, and if I have given you a better opinion of the young man than his conduct on fuller acquaintance will warrant, I assure you that I have not done so intentionally.

You will notice at once that he is a self-made man, so your admiration for the works of nature need not be in any way diminished. With due respect, your most obedient servant,

A. B.

To his Imperial Majesty DOM PEDRO,
Emperor of BRAZIL, ETC.

No. Z 30,865.

SIR: This letter of advice will probably precede a tall youth named Brindley. Mr. Brindley is a young man who, by a strange combination of circumstances, is the eldest son of a perfect gentleman, who now has, and will ever continue to have, my highest esteem and my promissory note for \$250.

Will you kindly bear this in mind while you peruse my pleading letter of introduction, which will accompany Mr. Brindley, Jr.?

All through his stormy and tempestuous career in the capacity of son to his father, he has never done anything that the grand jury could get hold of. Treat him as well as you can consistently, and if you can get him a position in a bank, I am sure his father would appreciate it. A place in a bank, where he would not have anything to do but look pretty and declare dividends in a shrill falsetto voice, would please him very much. He is a very good declaimer. He is not accustomed to manual toil, but he has always yearned to do literary work. If he could do the editorial work connected with the sight-draft department, or write humorous indorsements on the backs of checks, over a *nom de plume*, it would tickle the boy almost to death. Anything you could do toward getting him a position in a large bank that is nailed down securely, would be thoroughly appreciated by me, and I should be glad to retaliate at any time.

Yours candidly,

WYMAN DAYTON.

To K. O. PECK, ESQ., LONDON.

A beautiful feature of this invaluable system is the understanding to which everybody is committed, that the original letter is entirely worthless on its presentation unless the letter of advice has already been received.

Bill Nye.

To Critics.

WHEN I was seventeen I heard
From each censorious tongue,
"I'd not do that if I were you,
You see you're rather young."

Now that I number forty years,
I'm quite as often told
Of this or that I shouldn't do
Because I'm quite too old.

O carping world! If there's an age
Where youth and manhood keep
An equal poise, alas! I must
Have passed it in my sleep.

Walter Learned.

Mourned.

LOVED — lost — "is he dead" do you say?
Murray Hill has his name on a door;
There's a slow, measured step on the floor —
Ghost! why are you hid from the day?

His height was the stature of man;
His mind was the leader to mine;
I saw in him something divine;
I've lost him, console me who can.

See! this is the man was my friend;
So dull, so exact, so urbane,
So formal, so cold — to complain,
To reproach him were idle — what end?

With the red blood of youth in our veins
How high ran our hopes, our desires!
All good is for him who aspires —
He sank to a surfeit of gains.

Bowed down by a burden of gold,
Withdrawn from the labor of day,
He shrinks from life's conflict away;
I mourn for my comrade of old.

A MIDWINTER RESORT.

WITH ENGRAVINGS OF WINSLOW HOMER'S WATER-COLOR STUDIES IN NASSAU.

IT was the boast of Attila, "the Scourge of God," that wherever his steed planted his hoof, the grass thenceforth ceased to grow. A like blighting influence seems to have followed in the footsteps of the Spaniards who first visited the western world.

The light which guided Columbus to the shore of San Salvador, on the night of October 11, 1492, was to his pious imagination as the flaming Cross of Constantine,—a mystic symbol prophetic of conquests for Holy Church. To the belated native of the Bahamas who bore it, and to all his race, that light was an omen of disaster and death. Faith in an unseen country, peopled by their ancestors, was the chief article of their simple creed. With devilish craft, the Spaniards who followed in the footsteps of Columbus availed themselves of this belief to entice the natives to leave their island homes, and compelled them to labor in the mines and pearl-fisheries of Hispaniola. They promised to convey them to the abode of their ancestors, and after a hellish fashion fulfilled the promise. None were left behind; not one ever returned. Unaccustomed labor soon broke them down in body or mind, and death by suicide or disease followed, the entire race disappearing in fourteen years.

When we review the history of the Bahamas since that evil day, we may easily fancy that

the vengeful shades of these wronged natives still possess their coral islands. No other race has flourished here, and for a time it seemed as though no other was to be permitted to gain even a foothold. The Englishman drove out the Spaniard, and the Spaniard the Englishman in his turn. Chillingworth, the first English governor sent to the colony, was shipped abroad by his unruly subjects, who, "living a licentious life, were impatient of government." His immediate successor, Clark, was roasted on a spit by the Spaniards, but they did him the kindness to kill him first. This application of "civil-service reform" was somewhat overdone,—whether the governor was or not,—and naturally the office was not soon again applied for. The island of New Providence, the seat of government of the Bahamas, was, indeed, wholly deserted for a time. Its population, even now, after a growth of two hundred years, does not exceed twelve thousand. The first governor appointed after the resettlement, Cadwallader Jones, was also deposed and imprisoned by his subjects. The rule of Trott and Webb, who followed each other in one year, was less turbulent, but their successor was seized and put in irons by the islanders. The Spaniards carried off the next aspirant for gubernatorial honors. This so discouraged his successor that he took to the woods on his arrival, and returned, after a tremulous career of a few months, with his valuable commission unopened.

It is evident that the empire of the Bahamas was not one to be coveted then, and it is not much more to be desired now. England holds it rather from necessity than from choice; a necessity of that imperial forecast in which we,

her nearest neighbors across the Florida channel, are so deficient, and which England herself seems to be losing as she follows us in her progress towards democracy. New Providence was in our possession during the American Revolution, but Commodore Hopkins, who planted our flag there, thought that the guns and the governor were the only things worth possessing. These he carried away, leaving the island to the control of its British subjects. Our experience with blockade runners and Confederate cruisers during the war shows how much this blunder was destined to cost us. The commerce of the little port of Nassau was swollen at that time by the cargoes of nearly three hundred vessels, sailing in a single year to and from the Confederate ports. These increased the imports and exports to nearly fifty millions of dollars, furnishing the Confederates with the sinews of war and prolonging the fated contest. Those were gay times in the Bahama capital, when the captain of a blockade runner received for his trip \$5000, with the privilege of carrying ten bales of cotton; when money poured in from every quarter, and even the wharf-rats were enrolled in the obnoxious class of "capitalists." We had our revenge in the inevitable depression which succeeded this

scarcely grows at all. The idea of midsummer weather in midwinter warms the blood of the Northern visitor with a glow of cheerful anticipation. For the brief term of his voluntary exile the charm may continue, but, like a sea voyage under sunny skies and with fair winds, the monotony speedily becomes tedious. In the height of the season there are only some one hundred and fifty visitors at Nassau, and the number coming and going in an ordinary year is four or five hundred, eight hundred being the highest total known. Few Americans can long endure existence in a land without scenery except such as the ocean affords; without a mountain, or a stream of running water; without a railroad, bank, or telegraph line; with no Wall street or stock indicator; without so much as a single sheet that can be dignified by the name of newspaper. Thither should be banished by editorial edict those who declaim against the journals they read with such avidity, forgetting how easily they might protect themselves against them by letting them alone, as the people of the Bahamas are accustomed to do. The fine art of interviewing is unknown there, and a delightful unconsciousness of everything that is passing possesses the mind of the local editor. He has a conscience against disturbing the slumbers of the town with news fresh and startling. The failure of the Government Bank, which affected nearly every one in Nassau, was not reported in the Nassau "Guardian" until six weeks after the event. A news-boy crying an extra would be as out of keeping with his surroundings as would one of the stately royal palms among the telegraph poles of Broadway.

It is for those to whose sore lungs or rheumatic limbs our Northern winters bring endless misery that Nassau has its chief charm; but the proverb concerning shoemakers' wives and blacksmiths' horses holds good here. One of the diseases prevalent among the negroes, who furnish four-fifths of the population of the Bahamas, is consumption, and this station is, I understand, on the black list of the British Horse Guards, as one of the most unhealthy in this regard to which their colored soldiers are sent. But the traveler does not spend one-half his time in the water, as do the negroes, nor sleep in a cabin with windowless openings hermetically sealed at night by close-fitting blinds to keep out the wandering spirits of darkness. Nor are the comforts with which the visitor is surrounded accessible to the Conch, as the native is called. Even the best-regulated thermometer will have its vagaries, and there is no protection against it when it does "bear" the weather. The houses are without fire-places or stoves, and the ingleside of the domestic Briton has not been transplanted

A GROUP OF PALMS.

period of inflation, and left a blight upon the commerce of Nassau from which it has never recovered.

For those not compelled to live there, the Bahamas have their charms. Most of the natives would, I fancy, embrace any eligible opportunity to emigrate, and the population

A HURRICANE.

GROWING HEMP.

here, where it would be, indeed, out of place. The simple expedient of determining a man's military rank by the number of chimneys on his house, said to be in use in some of our Southern localities, would fail here, as the houses have no chimneys. The cooking is done in a kitchen detached from the main building, or in a fireplace built out-of-doors. Even the hotel has no conveniences for warming its rooms, and an invalid who last winter sought extra warmth was obliged to supply the lack of a chimney-flue by conveying her stove-pipe through a window-pane. Another visitor, a man of genius, and fertile in expedient, went to bed in his overcoat. But then he was an artist, and artists we class with the sensitive plants. The chief protection required is against the heat, and many of the houses are sheltered from the direct rays of the sun by an outer shell of lattice-work extending from balcony to balcony.

In justice to the Bahamas it should be said that we have the unanimous testimony of the inhabitants that such weather is exceptional, and the oldest residents agree in the declaration that they never saw its like before. We have the equally comforting assurance of the captain of the steamer, which carried us through as nasty weather as we wish to see, that it was something unknown to his winters' experience

in those seas. The very worst of Nassau winter weather is, however, like the balm of Gilead to the invalid, compared with the best our New York or New England climate affords at the same season. This is the place in which to seek complete repose for brain and nerves. A delicious sense of rest and refreshment descends upon all who do not carry with them the insane desire for locomotion which possesses our restless people, and are content with the rides and sails to which the delightful weather constantly invites them. It is the land of which Columbus wrote to his generous patron, Queen Isabella, in the first enthusiasm of his discovery: "This country excels all others as far as the day surpasses the night in splendor. The natives love their neighbors as themselves; their conversation is the sweetest imaginable; their faces always smiling; and so gentle and affectionate are they, that I swear to your highness there is not a better people in the world."

Alas that such a charming people should have been expatriated, and that in the process of evolution so little progress has thus far been made in reproducing their like! The negroes have something of their spirit, and as their blood is gradually giving a warmer and warmer coloring to that of the whites, a race such as Columbus admired may again people these

A FLOWER-SELLER.

islands. It is hard, though, to discover thus far any proof of De Moussy's theory that the mixed races are destined to return in a great measure to the superior races, possessing the added advantages of acclimatization. Slavery was abolished in 1834, and with it seems to have disappeared the prejudice of color. Even a generous admixture of it does not exclude one from white society or prevent a social intercourse

ported from England form a class by themselves, and the attempt to establish among them the etiquette of a vice-regal court excites in the minds of the profane a sentiment akin to that with which Gulliver must have viewed the ceremony at the court of Lilliput.

Those who are attracted to the Bahamas should not forget that islands have a way of lying out in the sea most suggestive of dis-

CONCH DIVERS. (SKETCH OWNED BY RUSSELL STURGIS, ESQ.)

from which may follow results most disturbing to one educated in the ideas which prevail at home. A story is told of a young American girl who married a Bahamian, with a shade of color too delicate to be noticed, and was taken home to the hospitalities of a family of relatives, descending through the various degrees of consanguinity to the dusky hue of Solomon's bride upon whom the sun had looked. Prosperity and the development of the faculty of accumulation will bring social success to the negro in our own country in time as it has here. The ten million dollars' worth of property reported to be in the possession of the negroes of Charleston has all the force for them of a new proclamation of emancipation. The wealthiest family in the Bahamas is of semi-negro origin, and the collector of the port is a full-blooded negro, who is justly respected for his character, education, and ability. The officials im-

comfort to owners of weak stomachs. Nassau lies some two hundred miles eastward from the Florida coast, and the Bahamas at the nearest point are seventy miles away; yet it seems to be beyond the energy of its inhabitants to maintain any permanent means of direct communication with the mainland. It remains to be determined whether the latest attempt to establish a line of steamers to a Florida port will supersede the present means of intercourse by steamers coming nine hundred miles south from New York, and stopping at Nassau once, or at the most twice, a month, between New York and Cuba. Aside from the prolonged misery which too frequently attends a voyage of four or five days in winter weather, the discomforts of landing are, at times, such as to daunt any but the most hardy. The industrious coral engineers, to whom the island of New Providence is indebted for its exist-

A PEDDLER.
(SKETCH OWNED BY MRS. MARTIN BRIMMER.)

ence, made no provision for a harbor, beyond throwing up the outlying reef called Hog Island, which only partly protects Nassau from the force of the sea. There is scarcely room between the two islands for an ordinary coasting steamer to manoeuvre, or sufficient depth of water in the channel to float a vessel of any size. The steamers that call here lie outside and drop their passengers over the bulwarks on to the retired New York tugboat that does duty as a transfer vessel. Like the other valetudinarians laid up in ordinary here, it has come South to lengthen out its days.

But transfer to the hotel by this means is comfort compared with the experience to which many visitors are subjected. With contrary winds and seas, approach to Nassau is impossible, and the steamer must make a harbor under the lee of the land, miles away. In some winds it is even compelled to go entirely around the island to South Bay, and dump its passengers on the beach, to get over the distance of fourteen miles to the hotel in carriages as best they can. There is a spice of adventure, but not such as invalids seek, in finding your way across a tangle of wilderness, through a country you never saw before. Fortunately for them there are no wild animals there larger than a hare, and the only representative of the ophidians is the chicken-snake, which is perfectly harmless, in spite of the fact that it is reported sometimes to grow to fifteen feet in length. The tarantulas or ground-spiders are the only venomous creatures on the island, unless we include the mosquitoes, which are said, with patriotic discrimination, to confine their visitations to foreigners. But these pests are citizens of the world, and extended their attentions even to the crew of the *Jeannette*, icebound in an Arctic sea.

Once safely landed at the Royal Victoria, everything will be found most comfortable, and

the balmy breezes from the sea will woo the invalid from thought of his pain. As he is there only for the winter, he is not disturbed by the reflection that the city of Nassau is the hottest place in the colony. The fact that it is built upon the slope of a ridge of land which shuts it out from the prevailing southerly breezes concerns only its unhappy summer residents. The "out islands," as all but New Providence are called, have attractive sites for health resorts, but furnish no accommodations for visitors. What the hotel at Nassau would do if it were dependent, as the residents are, upon local supplies, it would be hard to say. All of its meats are brought in huge refrigerators from New York, where everything seems to be obtained, excepting fruit and fish, of which there is abundance in delicious variety. It is impossible to give a complete dinner without calling upon the resources of the hotel. A few vegetables are grown in the hotel grounds in soil brought, like that in which the Capuchins of Rome are planted, from a distance. There is scarcely any soil upon the island, except in the pockets of the coral rocks; scarcely any foundation for it, indeed. The trees in this climate seem able to live upon the air, and you see them growing to large size on top of walls. Over the sides their roots spread themselves, until they reach the crevices in the rock below and take anchorage there. Cut down a jungle, and you find beneath nothing but a mass of conglomerated rock, formed of finely comminuted coral, shells, and various marine deposits of recent origin, with red earth composed of vegetable mold and the detritus of the limestone rock, scattered irregularly in patches of a few inches in depth. The roads through the town are made by smoothing off the top of the coral rock, and they are nearly as dazzling in the sun as a white-washed wall.

The walls that border them are built of the

A NASSAU GATEWAY.
(SKETCH OWNED BY E. W. HOOPER.)

same rock, with, in many cases, gates of entrance curiously projecting above the low wall itself. There are no fences, stone walls being required for protection against the winds, which at times sweep over these islands with the fury of the hurricane. The rock seems hard enough when weather-beaten, until you see a laborer at work upon it with hatchet and saw, shaping it to his uses. The ocean works

on the surface that the roots of plants and trees penetrate in all directions, seeking the fresh water stored up in its crevices, and resting upon the sea-water which is found below it. Andros Island is the only one of the group that has any pure water, except what is stored in tanks after a rain. The water of the shallow wells in Nassau is brackish, and rises and falls with the tide.

SHARK-FISHING — NASSAU BAR.

it into fantastic forms, of which we have an illustration in the famous Hole-in-the-wall on Abaco Island. This is an opening in the calcareous rock, through which the setting sun, blazing in its tropical majesty, at times produces a picture leaving an impression never to be effaced. The deposits of which the rock is formed have in places solidified into compact beds of limestone, from which fine building-stone is quarried. These beds show evidences of stratification, and abound in fossils of recent and living species. The infiltration of water through the mass of calcareous sand, produced by the attrition of the waves on the coral reef, has given to it an interior crystalline structure, like that of ancient limestone. Soft beneath, on the surface exposed to the air the coral rock is as hard as flint, and will, like flint, emit sparks when struck with a steel. Most of the coral rock is so porous

A tragedy is connected with the principal hotel, the Royal Victoria, which associates it with our own recent history. It is brought to mind by a notice found in the Nassau "Guardian" of fourteen years ago, to this effect:

NOTICE.

All persons having demands against the estate of the late Lewis F. Cleveland, deceased, are requested to render statements thereof, duly attested, on or before the first day of May next, to John S. Darling, Esquire.

And all persons who are indebted to said estate are requested to make immediate payment to the said J. S. Darling.

GROVER CLEVELAND,
W. W. STEPHENSON,
Executors.

January 20, 1873.

One of these executors has since been called to administer upon a larger estate. The occasion of his visit to Nassau in 1873 was the sudden and melancholy death of his brother, the lessee

of the hotel. He was lost on the steamer *Missouri*, burnt off Abaco Island on the morning of October 22, 1872. Another brother of President Cleveland, Mr. R. C. Cleveland, and a brother-in-law, were also among the victims of this disaster. Lewis Cleveland was a man of strong personality, and stories told of him would indicate that some of the characteristics of his distinguished brother are family traits. An inexorable rule of his hotel management forbade the payment of fees. One waiter who accepted a Christmas gift was promptly dismissed. The lady whose gratitude for special services had thus found expression finally secured the reversal of the sentence, on condition that the gift should be returned. "I will not," said Mr. Cleveland, "have those in my house who are unable or unwilling to fee the servants put to any disadvantage." It is told of Mr. Cleveland that, as he was on his way to the steamer at New York, he said: "I do not know how it is, but I have an impression that I cannot get rid of, that this will be my last voyage." So it proved, not only to him, but to sixty-eight others of the eighty-five persons who sailed in the *Missouri* as passengers and crew.

The loss of the *Missouri* is but one in a long train of disasters on record to the disadvantage of this fateful coast. What gives the Bahamas such value as they have for England is their situation opposite the entrance to the Gulf of Mexico. They lie directly in the track of the great commerce that goes in and out of the gulf, tempting to their fate innumerable vessels, some the victims of misfortune, others, how many no one can say, the victims of dishonest owners or dishonest skippers. The dwellers on the Bahamas are "toilers of the sea," and among the sea's most lucrative products for them are the wrecks strewn along the coast. The extent of the industry dependent upon disasters not included in the underwriters' description as "the act of God" can be judged by the statistics of wreckage during a given period of fifteen months, 1858-9. Within this time eighty vessels, having a value of two million six hundred thousand dollars, contributed their salvage to the wealth of the Conchs. These made good use of the opportunity afforded them, and it is notorious that the system of salvage established here is little better than organized robbery. Judge Marvin, of the United States District Court, Florida, shows that the salvage on vessels unlucky enough to be wrecked on the Bahama side of the Florida channel was eighty-seven per cent. of their value, while on the American side it was but fourteen per cent. This disproportion becomes more noticeable when we recall the fact that the Florida wreckers are

descendants of the Conchs; so the difference is one of laws and their administration, and not of people. The early inhabitants of the Bahamas were freebooters, preying on commerce under the lead of Black Beard and other pirates, and the breed does not seem yet extinct, in spite of the legend borne on the colonial escutcheon, "Expulsis Piratis, restituta Commercium." As the commerce of the United States is that which chiefly suffers, we have some right to protest. Here, again, we find ourselves paying tribute where we should be in a position to exact it. These islands were part of the colonial possessions known as the Carolinas, which came to us after the Revolution, and should have been included with them in the transfer of the title obtained from the Earl of Shaftesbury and his associates. The doubtful theory which holds that the Bahamas are built upon a deposit from our Mississippi would, if accepted, serve to give us a further title. Whatever their origin, they unquestionably belong to our system, as the colonists were once rudely reminded by the Home Government, in denying their request for an independent coinage. Geologically, the underlying stratum, upon which, as it gradually sank beneath the ocean, the coral insect built these islands, was once a part of our continent. Their work was begun thirty or forty thousand years ago, according to Agassiz, or one hundred thousand years after the corner-stone of the present Florida peninsula was laid by them. The Bahamas are the most northerly of the series of island groups beginning near the Florida coast and following the general trend of the North American continent for two thousand miles across the entrance of the Gulf of Mexico and the Caribbean Sea to near the mouth of the Orinoco in South America.

As to wrecking, two curious stories are told which illustrate local ideas. One is of the native who tendered the prospective profits of future salvages to a New York banker as security for a loan; another of the colonial governor who was about to return to England. In his farewell speech he offered to use his good offices to procure from the Home Government any favor the colonists might desire. The unanimous reply was as startling as the demand for the head of John the Baptist in a charger: "Tell them to tear down the lighthouses; they are ruining the prosperity of this colony." The one thing to be admired in these wreckers is the undoubted skill which long habit has given them. They will dive down through two hatches to fasten their grappling-irons on to packages floating in the lower hold, in the filthy mixture compounded of bilge-water and the various ingredients of an assorted cargo.

The Conch is, in fact, an amphibious animal. The proximity of water having a temperature, even in winter, of seventy degrees Fahrenheit, tempts the children, almost from the cradle, to seek upon the sea the freedom the land does not afford. This circumstance may also serve to explain the fact that the Baptists, judged by official statistics of average attendance, outnumber here all the other denominations combined. The sharks are not inviting, but there is a tradition that they do not take kindly to black flesh. Indeed, it is hard to find a proof that they meddle with human flesh of any color, in spite of such voracious stories as that with which the Duke of Edinburgh was entertained when here. According to this account, a boat carrying five men was upset off the coast, and nothing more seen of its occupants until a shark was captured within whose proper receptacle were stowed away five human skeletons, neatly arranged in a row. Clinging to the breast-bone of the man-eater was the silver watch carried by the former occupant of one of these skeletons,—still going. Without vouching for this story in all of its details, I can testify that I saw an unpleasantly suggestive-looking fin gleaming above the water near the spot where I had taken my boy of ten in the day before. One of the favorite pastimes of this land which affords so little game of any size is the hunting of sharks.

One of Mr. Homer's spirited sketches represents a party of fishermen watching one of their number as he appears above the water with a conch shell. The flesh of this mollusk furnishes a staple article of diet, as well as the bait with which the fish are enticed. Its shell is used for the manufacture of ornaments, and hidden in its recesses are occasionally found the pink pearls, the best of which command a high price. The "king conch" is the royal head of the mollusk tribe, represented in these waters by four thousand different species. Shells in every variety can be obtained from the shops along the shore devoted to the

sale of marine curiosities, and having a most ultramarine smell. One of the glories of Nassau is the opportunity it offers for the study of the wonders of the ocean depths. In a boat having panes of glass set in the bottom, you glide over the coral reefs, studying their wonders through the opalescent water, which the eye penetrates to a depth of eighty or more feet. Unconscious of your presence, the denizens of the under world pursue the routine of their daily lives, and without the formality of an introduction you seem to be admitted to their homes. Description fails in the attempt to convey the impression received from such a glimpse of the ocean world. You understand, as never before, how it is that all primitive peoples dwelling by the sea have filled it with the semi-human beings of their own imaginative creation. Indeed, you are more than half inclined to doubt whether they were not nearer the truth, and sigh for "the creed outworn" which gave a charm to the ocean of which science would despoil us.

In the area of the Bahamian colony may be properly included the whole of the coral banks of the Great and the Little Bahamas,—42,560 square miles in all. Of this, 3560 square miles project above the surface of the sea in over a thousand islands and cays, a total area of land about three-quarters that contained in the State of Connecticut. The submerged banks rise out of the ocean depths to within a few feet of the surface, and from them are gathered the sponges, the fish, the shells and pearls, and the turtles, which are either consumed or sold in exchange for foreign necessities and luxuries, to supplement the meager diet of fish and vegetables which is all the islands afford. The most interesting as well as the most valuable portion of the Bahamas lies beneath the sea. There is enough in the sea gardens alone to explain why it is that her Britannic Majesty's colony of the Bahamas is seen so generally through the halo of imaginative description alone.

William C. Church.

IN MASQUERADE.

NOW every twig's a gleaming lance
With jeweled haft of dazzling frost,
And withered tops of weeds, once tossed,
Are frozen in a spectral trance.

The moon is blown a silver boat
Across the soundless upper seas;
A beetling castle stand the trees,
The valley is a bridgeless moat.

Beyond the meadow winding down
The dusky hollow to the sea,
Beyond the unstirred poplar-tree,
I seek two lights within the town.

They glitter like a serpent's eyes,
And waiting in their luring glow,
The serpent-soul I seek, I know,
Sits there in woman's sweetest guise.

L. Frank Tooker.

PART OF AN OLD STORY.

ANY a traveler whose taste has led him fondly to sip the flavor of oral tradition in old European towns has heard the story of Angelo and Francesca told in the quiet streets of Palermo—told always in a

minor strain of mystery and sadness which recalls the memory of that other Francesca, the shadow of whose fate Dante has multiplied and cast upon every heart. There comes a point where the story is abruptly broken off; for the narrator, with pious ejaculations, says that, having lived thus long, Angelo and Francesca one day suddenly disappeared, and were never heard of again.

Strangely enough, now, after the lapse of nearly a hundred years,—for they disappeared in 1793,—the rest of their history comes to light. It is narrated in the Vatican manuscript entitled “The Last Confessions of the Count Orlando di Cagliostro,” to which the attention of the world was called for the first time last year by Professor Emanuel Kopfweg, of the University of Todtstadt. It is through his courtesy that the writer is enabled to present here a translation of the part containing the story of Angelo and Francesca.

If any one is going to ask whether the story is *true*—bah! Cagliostro was reputed not only a great scientist but a great charlatan—a greater one, perhaps, than that other Cagliostro, the letters of whose name were emblazoned with the disappearing gleams of the “Diamond Necklace.” Moreover, these “Confessions” were written for a credulous age; and it is known that Cagliostro vigorously worked the inexhaustible mine of human credulity, and found gold wherever he dug.

Still the history must be accepted as substantially true; for is not one-half of the story of Angelo and Francesca told even to-day in the streets of Palermo? And—not to be tediously logical—has the other half ever been told elsewhere than here?

Cagliostro wrote in the third person as follows:

I.

COUNT Cagliostro, prince of alchemists, sat alone one evening in the reception-room of his residence in Paris. Not long since he had passed beyond the eternal snow-line of human ambition, and from radiant heights he now

stood looking down upon his contemporaries, as a being who towered midway between the mortal and the divine. On his threshold, indeed, was still lingering the last loiterer of a worshiping throng that had sought him this very night from every caprice of the human fancy, every need of the human soul. Their departure, however, had brought Count Cagliostro no relief; for he was now in solitude to meet the yet more insistent company of his thoughts, which began to gather as of old around the subject of life—its essential nature, its irreversible laws, its melancholy imperfections, its pitiful span. Ere long he was interrupted in his meditations by the unexpected entrance of a young couple in whom all the warm, splendid beauty of the Italian race seemed to have but lately flowered forth in the richest perfection. They approached him with truthlike simplicity of demeanor and unrestrained evidences of reverential regard for his august presence. Interested in the highest degree, he asked them whence they came, and learned that they were from Palermo, the city of his own nativity, and the place where the achievements of his incomparable learning were most enthusiastically exaggerated.

“To what do I owe the happiness of this visit?” then inquired Cagliostro.

“We have come to ask a favor of your wonderful skill, Signor Conte.”

“And what favor may my wonderful skill render *you*, Angelo and Francesca? Shall I summon Death to relieve you of the burdens of old age?”

“Oh, Signor Conte! Francesca is but twenty-one.”

“And Angelo is just twenty-three, Signor Conte.”

“Then you are wasting away with incurable disease!”

“We have never known a day’s illness in our lives, Signor Conte.”

“Ah! I see. You wish to learn the alchemist’s secret of converting all things into gold.”

“We have great wealth, Signor Conte.”

“Why, here is an excellent mystery! Is it some monstrous crime that I am to hear you confess?”

“We have committed no crime, Signor Conte, and we are absolved of all our sins.”

“Youth, beauty, health, wealth, innocence! You possess all these, and yet you come to bespeak the offices of my poor skill! Ah!

Angelo and Francesca, it can render *you* no service. It is for those who come to me and say, 'Only mitigate the infirmities of old age, and we can bear all the rest'; or, 'Only ease this agony of pain, and we can bear all the rest'; or, 'Only aid us in the unequal struggle against poverty, and we can bear all the rest'; or, 'Only take from our souls the gnawing fang of remorse, and we can bear all the rest.' Such is the imperfect humanity by which my insufficient skill is too confidently sought. But you, you alone of all that I have ever seen, realize my dreams of ideal manhood and womanhood. And yet you may lack one thing: is it love?"

"Signor Conte," they cried passionately, "we love beyond the love of earth—beyond the love of heaven. It is the very perfection of our love that is the only source of our unhappiness. Two years ago we were wedded. Ah! the rapturous, the delirious joys of those two happy, happy years! From the ecstasy of this long trance, during which we had no thought of coming sorrow, we have just been fatally awakened. A pestilence is raging in Palermo. The air is full of the farewells of the dying, of wailings for the dead. Every morning we have trembled at the horrors of the coming day; every night we have clasped each other with forebodings that it would be the last. Ah! Signor Conte, the sadness of the human lot! Death, which may come at any instant, is the end of earthly love, and earthly love is so blissful that nothing in the power of even Heaven to bestow can ever compensate for its troubled course and too early dissolution."

"Angelo and Francesca, your remonstrances against destiny are at best shortsighted and vain. How have you lived so long in this world and been so strangely shielded from contact with its irreparable imperfections? Do you not know that love increases with increase of uncertainty? that it is purified by sorrows? that it blooms over the very abyss of parting, and sheds its perfume by the law of its own death? Too imperious and consuming is it, moreover, to be felt in this life without much alloy and for the briefest season. Return, then, to Palermo. Touching those inevitable casualties, those many sorrows, and that closing scene whereby it has pleased the will of Heaven to make the noblest passion of our mortal estate uneasy, sad, and brief, look not to find, in any means of mine, prevention or escapement."

"Signor Conte," they exclaimed in tears, "do not send us home to Palermo, but hear and grant the request which we have secretly come hither to make. How often have we not heard that you possess a marvelous elixir which has

potency to restore even to the old the intense and satisfying realities of the long-lost youth! Is not this known to the whole world? Is it not the highest distinction of your name? Have you not openly promised its benefits to those who will become your followers? By means of this elixir, then, blot out of our lives the past two years. Bring us back once more to the very hour of the night on which we stood before the altar and plighted our troth, that we, starting thence again, may live through the perfect joys—the ideal bloom and unspent freshness—that now seem to have vanished from life forever. The two years that are gone are worth more to us than all the uncertain future."

"Angelo and Francesca, you may indeed recall the past and live over its pleasures many, many times; for have you not memory? And a thousand other pleasures yet to come you may even now experience many, many times; for have you not hope? Be content, I pray you, with the beautiful past, and so act that the favor of Heaven may reward you with a beautiful future. This longing for a return to the years that are gone is the old, universal dream of the race—as uncontrollable as it is idle. Do you not understand that if the happy past could be recalled once, twofold then would be the regret that it could not be recalled yet again? Do you not feel that no repetitions of it, however many, could ever satisfy the soul, whose ideal is a youth of perpetual renewal, that is, a youth immortal? But I cannot bestow upon you immortality, Angelo and Francesca; and therefore, even if my skill were sufficient for it, would I be doing you a kindness in bringing back these two coveted years a single time?"

But his reply only made them the more importunate, and Cagliostro became conscious that for him their request was fast acquiring a supreme fascination. What they had said was true. He had indeed proclaimed to the world his discovery of an inestimably precious elixir which would consolidate in man the most vigorous forces of youth. He had indeed promised perfection, through physical and moral regeneration, to those who would become his followers and pass through the long and intricate ceremonials that he had ordained as the esoteric initiation to his mysterious cult. But he knew that all those marvelous cures which had hitherto contributed so much to his fame were effected by his unequaled skill in extracting and compounding the virtues of medicinal substances, powerfully aided by the credulity and the sanguine imaginations of those who took them. Only he knew that he had toiled through many years with unwearying assiduity of experiment and intensity of

thought, to discover a potion that would not only arrest for a time the processes of natural decay, but even suspend or reverse the action of the vital forces at work in the human body. Only he knew that there was now in his possession a subtle fluid which represented the product of his life-long labors. Its effects on human life he had hitherto allowed himself to test only in the most partial and unsatisfactory manner. The minutest drop, greatly diluted, he had seen reanimate the old for a short season, causing the long-silent laughter to break forth from the lips, the long-smoldering fires to flame up in the eye, the long-bent form to struggle to regain its intrepid erectness. If twice as much were given, the Count noted with wonderment that very much the same effects were produced, lasting through twice as long a time. Repeated experiments enabled him to determine with minute accuracy the relation between the strength and the quantity given and the length of time during which the effects would endure.

He had never ventured to test fully the qualities of the elixir, however, on account of his inability to secure the conditions under which it was imperative that the experiment should be made. All these he now saw fulfilled in the young couple before him. They were physically perfect, and would thus insure the most favorable result. They were willing to become parties to the secrecy which the awful nature of the deed would make indispensable. They had entire faith in his supernatural skill. And the period of two years which they had mentioned was so short that he would be enabled to modify the strength of the draught and thus greatly diminish the possibility of a fatal result. Never again would such an opportunity occur: should he allow it to pass?

Count Cagliostro arranged to make the experiment on the next night, which was the second anniversary of Angelo and Francesca's marriage.

II.

FOR the first few hours after giving to each of them a draught, the strength of which he delicately regulated by the means already mentioned, he hung over the couch on which they lay, with scarcely a hope that life was not extinct, and that the light of day would not fully reveal to him the ghastliness of his presumptuous and most unnatural deed. Angelo and Francesca lay in the same deathlike trance that they had immediately sunk into, clothed in the mysterious beauty with which mortality adorns itself before its transmutation into dust. At length a sigh that seemed to issue not from human lips, but from the bosom

of some invisible floating dream, wandered to the strained ear of the alchemist. Was it the last sigh of the old life, now soaring away from the earth, or was it the first troubled moan of a strange new life, that had just come in to tenant the abandoned clay? How dire had been the conflict between the forces of the two: the one hitherto had borne Angelo and Francesca inexorably forward toward old age and death; would the other now transport them as irremediably toward the past?

As the night wore on, their state seemed to become that of a weary, unnatural slumber. During the next day it assumed by imperceptible stages the aspect of a healthful and delicious rest. Cagliostro, who had never for a moment left their bedside, noted with transport the successive changes that denoted their difficult return from the very portals of death: the disappearance of ghastly pallor, the faint bloom that began to suffuse the cheeks, the eyelids, long rigid and tightened, now veiling the eyes with the soft adaptations of a sympathetic curtain. The white drapery of the couch fell like the thinnest veil of cloud about their forms, and revealed in clear outlines the exquisite molding of the limbs. Once the young husband, stirring in his sleep, threw his right arm across Francesca's breast. By this action the arm was left bare to the shoulder. Cagliostro then for the first time noticed that on it between the elbow and the shoulder was a wound, not yet entirely healed, that had evidently been made with a stiletto. Bending down to inspect this, he observed that on Francesca's bosom also, just above the heart, was a similar wound, in the same stage of incomplete healing. Afterward these wounds came to have a peculiar significance. Late that night Cagliostro, now worn out not so much by watching as by intense anxiety, sought his own chamber for a few hours' sleep, hopeful that the morning would bring him auspicious revelations.

Scarcely had the sun risen, when he hastened to them. They had already dressed themselves, and were now sitting with clasped hands at the open window. An exclamation of delight broke from the alchemist at the spectacle of their more than restored beauty. Such was its dewy freshness, its semblance of unworn faculty and surcharged power, that they might indeed have embodied a dream of immortal youth. But when Cagliostro had quickly approached them, he stood transfixed with horror to perceive that the intellectual and emotional counterpart of all this physical loveliness was lacking. Some great and incomprehensible change had passed over them, in regard to which they themselves could give

only bewildered and bewildering statements. Their lips seemed ever ready to part in delightful laughter, yet they felt no impulse to laugh; their eyes flashed, but not from the enjoyment of anything visible nor with the excitement of mental discovery; their graceful and animated movements appeared to have no relation to newly formed purposes and future results, but to be aimless revivals of things already experienced.

Many days passed before Cagliostro grasped the startling significance of the physical and the psychical phenomena that now began to fall under his notice and that became his constant study during the next two years. In so far as the elixir had affected the physical bases and forces of life, it seemed to have inaugurated a series of changes that might supposably have taken place in the case of persons growing younger, and growing younger at the same rate at which they had previously grown older. The evidences of this were slowly derived both from special facts and general results. Thus, he ascertained from Angelo that the stiletto wounds had been inflicted by a former suitor of Francesca's, who, maddened by long brooding over his unhappy passion, had one evening suddenly sprung upon them in the street, and aimed a blow at her heart. Angelo's quickly interposed arm had checked the course of the weapon, which had then been run through the arm itself by the assassin before he fled. This incident had occurred two months before their coming to Cagliostro. Two months after their coming these wounds disappeared, leaving neither on Angelo's arm nor Francesca's bosom the least traceable cicatrice. Most remarkable was it to observe that during this period the wounds had the appearance of going through a process the reverse of that of healing. They daily grew more red and swollen and painful, and on the night prior to their complete disappearance, they opened and bled afresh, as though but just inflicted.

During the previous year, Angelo's artistic imagination had all at once become fascinated with the heroic models of antiquity, and he had developed his muscles to athletic proportions. These now gradually declined, and in the end they reassumed simply the fine outlines that were his natural masculine endowment. Francesca, too, slipped from the lately opened rose of womanhood back into the half-blown, more enrapturing delicacy of the maiden.

More extraordinary still were the psychical changes through which they passed. If, as regards the purely vital forces, they seemed to be in the condition of persons who were growing younger, so, as regards the mind, they appeared to be retracing the stages of their

latest development. All the knowledge that they had acquired in the two preceding years they now began to lose in an order the reverse of acquisitive technical skill left them, and they remained as though it had never been possessed. Thus, there were favorite books which they had hitherto never grown weary of discussing. Henceforth all knowledge of these began to pass away. The familiar passages in due time died out of their memories; they remembered them only as forgotten. Angelo had brought with him to Paris an unfinished painting, one of the figures in which was to represent Francesca. When he resumed work on it, he found himself unable to carry out the unexecuted part of his design. The particulars of this design, one by one, were lost from his consciousness, as one by one they had grown in his artistic conception. Under his diminishing skill the picture passed from bad to worse. Time and again, at rare intervals, he returned to it and despairingly left it; and before the period of two years had expired, it became simply a blurred and unintelligible canvas. Cagliostro ascertained that only two years before he had begun to receive instructions in painting. Francesca, too, gradually forgot the songs that she had most recently learned to sing. Those highest notes of her beautiful voice, which marked the latest extensions of its register, she soon discovered that she could no longer reach. Even while at the piano one day, the familiar notes of the music began to falter strangely from her lips, and her fingers grew motionless amid the dying echoes of the forgotten chords.

While there was this phase of forgetfulness, there was also one of reminiscence. They seemed to experience as complete a resuscitation of mental experience as was possible, considering the differences between their present and their original situation in the world. The past came back to them; disjointed sentences, the fragments of former conversations, started from the brain; sudden impulses to action, now divorced from all natural setting, swayed the will; old perplexities and old temptations besieged the heart; the former joys, which they had so eagerly desired to revive, now reappeared,—all a faded pageant,—a mocking, ghostly train, sweeping before the disappointed and disenchanted vision of the soul and compelling it to sit in calmer judgment upon the ruined idols and empty vanities of its previous estate.

Finally, there were the emotions with which Angelo and Francesca contemplated all these changes. As, in the order of nature, the soul abides within and notes how the body grows old,—how a furrow is plowed across the brow, a film creeps over the eye, how knowledge

perishes and skill is lost,—so the souls of this young pair, remaining aloof from all material mutations though not uninfluenced by them, appeared freely cognizant of the progressing rejuvenescence. They remembered their former future, which had now become their past; they realized that they were now being borne toward their former past, which thus became their future. But scarcely had they awakened to a realization of the fearful thought that they were growing younger, that they alone of all the race were being borne irremediably, not toward that verge of life where Death opens the portal of the infinite hereafter, but toward that more awful verge where Birth closes the portal upon the void and formless infinite behind; scarcely had they begun to see themselves losing day by day all that knowledge has power to bestow or art has beauty to inspire, before they threw themselves at the alchemist's feet and implored him to release them from the inexorable force of the imperious elixir.

III.

UNHAPPY, thrice unhappy Cagliostro! He had evoked the occult powers of science, and he now stood aghast at his own indestructible success. He durst neither interfere with what he had done, lest instant death should be the result, nor breathe to his own spirit a prophecy of the uncertain end. The visible workings of those laws which he and a long line of illustrious predecessors from the days of Hippocrates had, with the costliest devotion of years, sought to bring into activity, now terrified him as the very presence of the supernatural. Worse than this: Francesca had been under his roof but a little while ere he conceived for her a consuming passion. In earlier years he had known no pleasure greater than that of the society of beautiful and brilliant women, but the rigor of scientific pursuits and the august character of his position in the world had long compelled him to lead a life of unmitigated loneliness. Now his passionate heart reasserted itself; and ambition, learning,—all that he had achieved or ever hoped to win,—became as nothing to him in comparison with his love for Francesca, whose perfection he had once coldly surveyed as the means of making a scientific experiment. Exquisite punishment—reaching him even before the awful vengeance of insulted Heaven! By his own skill he had forced himself to behold the daily restoration of her more youthful loveliness; and he had given the labor of his life-time to renew for her those two years of wedded happiness with Angelo, to see her in whose arms for a

single moment was to him the torture of eternity.

Truly, when Heaven shall allow one to attain a knowledge of the elixir of youth, will it not curse him by denying the wisdom that should accompany the power to use it?

He could not even fly from her, for he alone might hope to save her life. Thus, the fear of some unforeseen issue kept him near her during the day; and often at night, starting with horror from the pale specter of his dreams, he would take a lamp, and, stealing to the couch whereon she lay with her head on Angelo's bosom, assure himself that the end was not yet come. How little sweeter than death was this spectacle to him! In her incomprehensible state of mind and body, even momentary separation from Angelo might have brought about immediate death, and to destroy Angelo, as in his jealous frenzies he sometimes thought of doing, was an aggravation of his offenses that the dread thought of eternity always intervened to prevent.

One midnight he returned from one of these stolen visits to their chamber and threw himself upon the floor of his room, groveling in agony. Then he went to a secret panel-hidden recess in the wall, and taking from it a crystal vial filled with an ineffably bright fluid, he placed it on a table in the center of the room and took his seat before it.

"Inestimably precious elixir! What toil of studious years is not compressed into thy golden drops! What beautiful processes are not involved in thy slow distillation! The subtlest secrets of earth and air and sky unite their potencies in thy unequalled composition. Old—old—old baffler! universally dreamt of, despairingly sought for, never before found! Best of all things on this mortal side of the universe! Restorer of the past! Giver of strength and nimbleness and color to decrepitude, tottering and shivering and whitening through the long night of wintered years! Thou flashest here and dashest thy shimmering depths against thy prison-walls, as diffusive as perfume, as light as thought. But thou shalt return this night to the thousand visible and invisible sources from which thy virtues were collected. What hast thou been to Cagliostro? Poison deadlier than twisted wolf's-bane or mournful nightshade—draught of death to his hopes, his love, and his ambition. Thou mockery of the race! Over none other shalt thou ever cast thy fatal enchantment. Shattered now be thy receptacle! scattered be thy volatile, fast-vanishing drops! Blotted out from the brain be thy unhallowed formula, and never again be thy awful substance compounded!"

After this, nothing seemed to remain for him in life but to bring his daring experiment to an issue, and dismiss the young pair in peace. He had assigned them apartments in his house opening upon a garden, in which had been collected not only the numerous plants whose medicinal properties he wished to ascertain, but every flower that could delight the senses. It was here, face to face with material nature, that they had the final realization of their deplorable state. Twice they watched the annual procession of her forces, and through the benign stages of growth, mature effulgence, and decay traced the completed cycle of her forms. But they — they alone of all created things — seemed to have turned backward in their course, as though the vine, having clambered high upon the wall, should sink down into the tender, precarious shoot; or the rose, having once bloomed, should gather together its petals and disappear from sight on the summit of the green stalk. Here, perhaps, they came to entertain that broad view of life which embraces its endless succession of transitory forms, its long array of waiting and more splendid pageants, for which room must be made by those in front and whose preëstablished order of march none dare confuse. Here, perhaps, the overweening selfishness of personality, which would ask to have its coveted joys renewed and repeated at any unnatural cost, received its complete humiliation. And, in the end, perhaps the least desirable of all things was this return to their past, since it could but lengthen the time before they could enter those higher mysteries whose privileges appertain to eternity alone.

IV.

At length the two years drew toward a close, and the day approached in which Cagliostro had arranged that the effects of the elixir should expire. Whatever the result might be, he had now come to perceive that for one or all of them it must be tragical. If Angelo and Francesca should be left free to return to the world and publicly attest his supernatural skill, he foresaw his loss of her and his probable martyrdom at the hands of the Holy Inquisition for his impious attempts to contravene the divinely appointed laws of life and death. Over the other possible issues he had latterly pondered with awful forebodings. They were three. What if his calculation should prove erroneous, and the relentless hold of the elixir upon the bodies of Angelo and Francesca should continue, continue for years, continue until they were carried backward into helpless infancy — into — horrible thought! — what final state? Should he be

compelled to witness the gradual transformation of the woman he loved into a handful of dust? Or, what if the calculation were right, and the effects of the draught were to expire at the expected moment? Would not the shock to the brain have been too great — its long unnatural action fatal — and would not Angelo and Francesca be left mindless, emotionless, mere beautiful idiots? Or, what if the natural life had ceased at the time the elixir was given, as it had seemed to do, and this strange state were but due to the fictitious vitality imparted by his own skill? When its sustaining virtues should be spent, would it not be found that the threads of existence had been snapped asunder long before?

Cagliostro denied himself to all visitors, and prepared for the supreme moment. In order to facilitate a transition from their artificial to their natural state, he arranged that it should take place amid a scene of bridal joy and beauty, befitting their return to the very hour of their nuptials. He chose for this purpose the most splendid room in his almost palatial residence. Lamps, swung by silver chains from the fretted ceiling, emitted flames of various colors. Down the walls and before the lofty windows fell rich tapestries and cloudlike masses of gorgeous curtains. On the marble floor lay the richest skins and rugs of the Orient. In the center of the room was represented the fountain of perpetual youth, whose descending perfumed sprays filled the ear with low molten music. Near this stood a collation, with joy-bringing wines in which they were to pledge each other for the new life. Over the feast presided a bronze figure of Time, his scythe entwined with roses. At one end of the room was a bridal altar, illumined by the myriad serene, starlike lights of crystal chandeliers. Above this altar hung one great picture — Medea at the moment of witnessing the triumphant restoration of the old king to his youth.

The day passed, the evening came, the hour began that was, at its close, to usher in the fateful moment. Cagliostro had instructed Angelo and Francesca to dress themselves as they had been dressed on the night of their nuptials. Half an hour before the time, he went to them and led them into the room that was to be the auspicious scene of their awakening. Borne on by uncontrollable excitement, he advanced with them unconsciously to the very steps of the altar, and standing on one of the steps, he joined their hands and held them clasped firmly in his own. How could he control himself to speak to them? His heart was broken; his brain was on fire. Never had he seen or dreamt of such beauty as Francesca now finally revealed

DRAWN BY ROBERT BLUM.

"SOME GREAT AND INCOMPREHENSIBLE CHANGE HAD PASSED OVER THEM."

when dressed as a bride; it was the last extreme of torture. She stood arrayed thus only to renew her pledges of love to Angelo! Never, in comparison with the lustrous bloom and admirable symmetry of Angelo, had his own weakened frame and homely face been so acute a cause of irreparable wretchedness. Silently he looked down upon them, as they looked at each other and seemed suddenly to flush as with joyful anticipations of the approaching change. A few minutes, and he spoke:

"Angelo and Francesca, two years ago this evening, at the exact expiration of this hour, you received from me by your own request a draught of that elixir which was to turn backward the course of your lives and restore to you the joys of your bridal. With the stroke of the clock, as I expect, the last traces of that elixir will die out of your veins, leaving you free to go forth into the world again. But oh! Angelo and Francesca, you have learned in the meantime how melancholy a thing it is to turn backward over the course of even the happiest life. You have long since haply been led to believe that this longing for a return to youth is not meant to be gratified here, where one imperfect life is enough for one to live, but constitutes a slumberous prescience of its realization elsewhere in the universe."

Was it the effect of his words that sent a sudden shiver through their frames and caused them to drink deep, deep of the light in each other's eyes?

"While you have been learning this, I—alas!—have been purchasing wisdom with

an age of suffering. I shall send you forth into life now, better reconciled to its inalienable imperfections, because better understanding their spiritual beauty and divine forecastings; but who is there to teach me, an old man, broken and desolate and pierced with many sorrows, how the residue of my years may be sweetened with human joys, or made an acceptable offering to Heaven?"

With a sudden pallor overspreading their faces, and heavy shadows under their eyes, they turned their gaze upon him, and clung awe-stricken to each other.

"A minute more, and the stroke of the clock will release you from the thralldom of the draught. Angelo, as you lead Francesca toward the long green uplands of life, remember Cagliostro, who used his skill—and did not use it ungenerously against you! Francesca, Francesca! Sometimes remember Cagliostro, whose heart was broken—"

The stroke!

At that instant Angelo and Francesca, without a groan, sank down together dead at the foot of the altar, their natural life having been ended two years before; and Cagliostro, his secret fears realized,—Francesca dead, and he her murderer,—fell forward in a long swoon upon the bridal attire and the cold dust of the unhappy pair, nor heard the music of the fountain of youth, nor saw the roses dying around the scythe of the figure of Time, nor watched the lights go out one by one on the bridal altar, nor met the gaze of Medea looking down fiercely upon him from the pictured wall.

James Lane Allen.

THE CHICKADEE.

WHEN trees stand mute with bare, protesting arms
 Against the grayness of November skies,
 Wherein the menace of a snow-storm lies;
 When bushes all have lost their mellow charms—
 Save the witch-hazel whose dim stars appear,
 In quaintest mockery of its fabled powers,
 Like pallid ghosts of golden summer hours:
 When winds seem sighing for the dying year;
 When not a bird that mated in the Spring's
 Elusive Eden dares to linger near,
 Even to sing farewell, but spreads his wings
 And, aiming South, shoots off with sudden fear
 Of the cold clouds foreshadowing snows to be—
 Then long and strong of song is heard the chickadee.

CAMPAIGN FOR CONGRESS.

IN the months that remained of his term, after the election of his successor, President Tyler pursued with much vigor his purpose of accomplishing the annexation of Texas, regarding it as the measure which was specially to illustrate his administration and to preserve

it from oblivion. The state of affairs, when Congress came together in December, 1844, was propitious to the project. Dr. Anson Jones had been elected as President of Texas; the republic was in a more thriving condition than ever before. Its population was rapidly increasing under the stimulus of its probable change of flag; its budget presented a less

REV. PETER CARTWRIGHT AND HIS WIFE.

unwholesome balance; its relations with Mexico, while they were no more friendly, had ceased to excite alarm. The Tyler Government, having been baffled in the spring by the rejection of the treaty for annexation which they had submitted to the Senate, chose to proceed this winter in a different way. Early in the session

a joint resolution providing for annexation was introduced in the House of Representatives, which, after considerable discussion and attempted amendment by the antislavery members, passed the House by a majority of twenty-two votes. In the Senate it encountered more opposition, as might have been

expected in a chamber which had overwhelmingly rejected the same scheme only a few months before. It was at last amended by inserting a section called the Walker amendment, providing that the President, if it were in his judgment advisable, should proceed by way of negotiation, instead of submitting the resolutions as an overture on the part of the United States to Texas. This amendment eased the conscience of a few shy supporters of the Administration who had committed themselves very strongly against the scheme, and saved them from the shame of open tergiversation. The President, however, treated this subterfuge with the contempt which it deserved, by utterly disregarding the Walker amendment, and by dispatching a messenger to Texas to bring about annexation on the basis of the resolutions, the moment he had signed them, when only a few hours of his official existence remained.

The measures initiated by Tyler were, of course, carried out by Polk. The work was pushed forward with equal zeal at Washington and at Austin. A convention of Texans was called for the 4th of July to consider the American propositions; they were promptly

accepted and ratified, and in the last days of 1845 Texas was formally admitted into the Union as a State.

Besides the general objections which the antislavery men of the North had to the project itself, there was something especially offensive to them in the pretense of fairness and compromise held out by the resolutions committing the Government to annexation. The third section provided that four new States might hereafter be formed out of the Territory of Texas; that such States as were formed out of the portion lying south of $36^{\circ} 30'$, the Missouri Compromise line, might be admitted with or without slavery, as the people might desire; and that slavery should be prohibited in such States as might be formed out of the portion lying north of that line. The opponents of slavery regarded this provision, with good reason, as derisory. Slavery already existed in the entire territory by the act of the early settlers from the South who had brought their slaves with them, and the State of Texas had no valid claim to an inch of ground north of the line of $36^{\circ} 30'$ nor anywhere near it; so that this clause, if it had any force whatever, would have authorized the establishment of slavery in a portion of New Mexico, where it did not exist, and where it had been expressly prohibited by the Mexican law. Another serious

objection was that the resolutions were taken as committing the United States to the adoption and maintenance of the Rio Grande del Norte as the western boundary of Texas. All mention of this was avoided in the instrument, and it was

to the annexation of Texas, it is nevertheless certain that the occupation of the left bank of the Rio Grande, without an attempt at an understanding, would bring about a collision. The country lying between the Nueces and the

expressly stated that the State was to be formed "subject to the adjustment by this Government of all questions of boundary that may arise with other governments," but the moment the resolutions were passed the Government assumed, as a matter beyond dispute, that all the territory east of the Rio Grande was the rightful property of Texas, to be defended by the military power of the United States.

Even if Mexico had been inclined to submit

Rio Grande was then entirely uninhabited, and was thought uninhabitable, though subsequent years have shown the fallacy of that belief. The occupation of the country of Texas extended no farther than the Nueces, and the Mexican farmers cultivated their corn and cotton in peace in the fertile fields opposite Matamoras.

It is true that Texas claimed the eastern bank of the Rio Grande from its source to its mouth: and while the Texans held Santa

Anna prisoner, under duress of arms and the stronger pressure of his own conscience, which assured him that he deserved death as a murderer, "he solemnly sanctioned, acknowledged, and ratified" their independence with whatever boundaries they chose to claim; but the Bustamente administration lost no time in repudiating this treaty, and at once renewed the war, which had been carried on in a fitful way ever since.

But leaving out of view this special subject of admitted dispute, the Mexican government had warned our own in sufficiently formal terms that annexation could not be peacefully effected. When Mr. Upshur first began his negotiations with Texas, the Mexican Minister of Foreign Affairs, at the earliest rumors of what was afoot, addressed a note* to Waddy Thompson, our Minister in Mexico, referring to the reported intention of Texas to seek admission to the Union, and formally protesting against it as "an aggression unprecedented in the annals of the world," and adding, "if it be indispensable for the Mexican nation to seek security for its rights at the expense of the disasters of war, it will call upon God, and rely on its own efforts for the defense of its just cause." A little while later General Almonte renewed this notification at Washington, saying in so many words that the annexation of Texas would terminate his mission, and that Mexico would declare war as soon as it received intimation of such an act. In June, 1845, Mr. Donelson, in charge of the American Legation in Mexico, assures the Secretary of State that war is inevitable, though he adopts the fiction of Mr. Calhoun, that it is the result of the abolitionist intrigues of Great Britain, which he credited with the intention "of depriving

* August 23, 1843.

both Texas and the United States of all claim to the country between the Nueces and the Rio Grande."

No one, therefore, doubted that war would follow, and it soon came. General Zachary Taylor had been sent during the summer to Corpus Christi, where a considerable portion of the small army of the nation was placed under his command. It was generally understood to be the desire of the Administration that hostilities should begin without orders, by a species of spontaneous combustion; but the coolness and prudence of General Taylor made futile any such hopes, if they were entertained, and it required a positive order to induce him, in March, 1846, to advance

towards the Rio Grande and to cross the disputed territory. He arrived at a point opposite Matamoras on the 28th of March, and immediately fortified himself, disregarding the summons of the Mexican commander, who warned him that such action would be considered as a declaration of war. In May General Arista crossed the river and attacked General Taylor on the field of Palo Alto, where Taylor won the first of that remarkable series of victories, embracing Resaca de la Palma, Monterey, and Buena Vista, all gained over superior forces

of the enemy, which made the American commander for the brief day which was left him the idol alike of soldiers and voters.

After Baker's election in 1844, it was generally taken as a matter of course in the district that Lincoln was to be the next candidate of the Whig party for Congress. It was charged at the time, and some recent writers have repeated the charge, that there was a bargain made in 1840 between Hardin, Baker, Lincoln, and Logan to succeed each other in the order named. This sort of fiction is the commonest

known to American politics. Something like it is told, and more or less believed, in half the districts in the country every year. It arises naturally from the fact that there are always more candidates than places, that any one who is a candidate twice is felt to be defrauding his neighbors, and that all candidates are too ready to assure their constituents that they only want one term, and too ready to forget these assurances when their terms are ending. There is not only no evidence of any such bargain among the men we have mentioned, but there is the clearest proof of the contrary. Two or more of them were candidates for the nomination at every election from the time when Stuart retired until the Whigs lost the district. At the same time it is not to be denied that there was a tacit understanding among the Whigs of the district that whoever should, at each election, gain the honor of representing the one Whig constituency of the State, should hold himself satisfied with that privilege, and not be a candidate for reëlection. The retiring member was not always convinced of the propriety of this arrangement. In the early part of January, 1846, Hardin was the only one whose name was mentioned in opposition to Lincoln. He was reasonably sure of his own county, and he tried to induce Lincoln to consent to an arrangement that all candidates should confine themselves to their own counties in the canvass; but Lincoln, who was very strong in the outlying counties of the district, declined the proposition, alleging, as a reason for refusing, that Hardin was so much better known than he, by reason of his service in Congress, that such a stipulation would give him a great advantage. There was fully as much courtesy as candor in this plea, and Lincoln's entire letter was extremely politic and civil. "I have always been in the habit," he says, "of acceding to almost any proposal that a friend would make, and I am truly sorry that I cannot to this." A month later Hardin saw that his candidacy was useless, and he published a card withdrawing from the contest, which was copied and commended in the kindest terms by papers friendly to Lincoln, and the two men remained on terms of intimate friendship.

The convention was held at Petersburg on the 1st of May. Judge Logan placed the name of Lincoln before it, and he was nominated unanimously. The Springfield "Journal," giving the news the week after, said, "This nomination was of course anticipated, there being no other candidate in the field. Mr. Lincoln, we all know, is a good Whig, a good man, an able speaker, and richly deserves, as he enjoys, the confidence of the Whigs of this district and of the State."

The Democrats gave Mr. Lincoln a singular competitor—the famous Methodist preacher,

Peter Cartwright. It was not the first time they had met in the field of politics. When Lincoln ran for the Legislature on his return from the Black Hawk war, in 1832, one of the successful candidates of that year was this indefatigable circuit-rider. He was now over sixty years of age, in the height of his popularity, and in all respects an adversary not to be despised. His career as a preacher began at the beginning of the century and continued for seventy years. He was the son of one of the pioneers of the West, and grew up in the rudest regions of the border land between Tennessee and Kentucky. He represents himself, with the usual inverted pride of a class-leader, as having been a wild, vicious youth; but the catalogue of his crimes embraces nothing less venial than card-playing, horse-racing, and dancing, and it is hard to see what different amusements could have been found in southern Kentucky in the year 1801. This course of dissipation did not continue long, as he was "converted and united with the Ebenezer Methodist Episcopal Church" in June of that year, when only sixteen years old, and immediately developed such zeal and power in exhortation that less than a year later he was licensed "to exercise his gifts as an exhorter so long as his practice is agreeable to the gospel." He became a deacon at twenty-one, an elder at twenty-three, a presiding elder at twenty-seven, and from that time his life is the history of his church in the West for sixty years. He died in 1872, eighty-seven years of age, having baptized twelve thousand persons and preached fifteen thousand sermons. He was, and will always remain, the type of the backwoods preacher. Even in his lifetime the simple story of his life became so overgrown with a net-work of fable that there is little resemblance between the simple, courageous, prejudiced itinerant of his "Autobiography" and the fighting, brawling, half-civilized, Protestant Friar Tuck of bar-room and newspaper legend. It is true that he did not always discard the weapons of the flesh in his combats with the ungodly, and he was more than once compelled to leave the pulpit to do carnal execution upon the disturbers of the peace of the sanctuary; but two or three incidents of this sort in three-quarters of a century do not turn a parson into a pugilist. He was a fluent, self-confident speaker, who, after the habit of his time, addressed his discourses more to the emotions than to the reason of his hearers. His system of future rewards and punishments was of the most simple and concrete character, and formed the staple of his sermons. He had no patience with the refinements and reticences of modern theology, and in his later years observed with scorn and

sorrow the progress of education and scholarly training in his own communion. After listening one day to a prayer from a young minister which shone more by its correctness than its unction, he could not refrain from saying, "Brother —, three prayers like that would freeze hell over!"—a consummation which did not commend itself to him as desirable. He often visited the cities of the Atlantic coast, but saw little in them to admire. His chief pleasure on his return was to sit in a circle of his friends and pour out the phials of his sarcasm upon all the refinements of life which he had witnessed in New York or Philadelphia, which he believed, or affected to believe, were tenanted by a species of beings altogether inferior to the manhood that filled the cabins of Kentucky and Illinois. An apocryphal story of one of these visits was often told of him, which pleased him so that he never contradicted it: that becoming bewildered in the vastness of a New York hotel, he procured a hatchet, and in pioneer fashion "blazed" his way along the mahogany staircases and painted corridors from the office to his room. With all his eccentricities, he was a devout man, conscientious and brave. He lived in domestic peace and honor all his days, and dying, he and his wife, whom he had married almost in childhood, left a posterity of one hundred and twenty-nine direct descendants to mourn them.*

With all his devotion to the cause of his church, Peter Cartwright was an ardent Jackson politician, with probably a larger acquaintance throughout the district than any other man in it, and with a personal following which, beginning with his own children and grandchildren and extending through every precinct, made it no holiday task to defeat him in a popular contest. But Lincoln and his friends went energetically into the canvass, and before it closed he was able to foresee a certain victory.

An incident is related to show how accurately he could calculate political results in advance—a faculty which remained with him all his life. A friend, who was a Democrat, had come to him early in the canvass and had told him he wanted to see him elected, but did not like to vote against his party; still he would vote for him, if the contest was to be so close that every vote was needed. A short time before the election Lincoln said to him, "I have got the preacher, and I don't want your vote."

* The impressive manner of Mrs. Cartwright's death, who survived her husband a few years, is remembered in the churches of Sangamon County. She was attending a religious meeting at Bethel Chapel, a mile from her house. She was called upon "to give her testimony," which she did with much feeling, concluding with the words, "the past three weeks have been the happiest of all my life; I am waiting for the chariot." When the meeting broke up, she did not rise with the rest. The minister

The campaign was carried on almost entirely without expense. Mr. Joshua Speed told the writers that some of the Whigs contributed a purse of \$200, which Speed handed to Lincoln to pay his personal expenses in the canvass. After the election was over the successful candidate handed Speed \$199.25, with the request that he return it to the subscribers. "I did not need the money," he said. "I made the canvass on my own horse; my entertainment, being at the houses of friends, cost me nothing; and my only outlay was 75 cents for a barrel of cider, which some farm-hands insisted I should treat them to."

The election was held in August, and the Whig candidate's majority was very large—1511 in the district, where Clay's majority had been only 914, and where Taylor's, two years later, with all the glamour of victory about him, was ten less. Lincoln's majority in Sangamon County was 690, which, in view of the standing of his competitor, was the most remarkable proof which could be given of his personal popularity;† it was the highest majority ever given to any candidate in the county during the entire period of Whig ascendancy until Yates's triumphant campaign of 1852.

This large vote was all the more noteworthy because the Whigs were this year upon the unpopular side. The annexation of Texas was generally approved throughout the West, and those who opposed it were regarded as rather lacking in patriotism, even before actual hostilities began. But when General Taylor and General Ampudia confronted each other with hostile guns across the Rio Grande, and still more after the brilliant feat of arms by which the Americans opened the war on the plain of Palo Alto, it required a good deal of moral courage on the part of the candidates and voters alike to continue their attitude of disapproval of the policy of the Government, at the same time that they were shouting pæans over the exploits of our soldiers. They were assisted, it is true, by the fact that the leading Whigs of the State volunteered with the utmost alacrity and promptitude in the military service. On the 11th of May, Congress authorized the raising of fifty thousand volunteers, and as soon as the intelligence reached Illinois, the daring and restless spirit of Hardin leaped forward to the fate which was awaiting him, and he instantly issued a call to his brigade of

militia, in which he said: "The general has already enrolled himself as the first volunteer from Illinois under the requisition. He is going whenever ordered. Who will go with him? He confidently expects to be accompanied by many of his brigade." The quota assigned to Illinois was three regiments; these were quickly raised,* and an additional regiment offered by Baker was then accepted. The sons of the prominent Whigs enlisted as private soldiers; David Logan was a sergeant in Baker's regiment. A public meeting was held in Springfield on the 29th of May, at which Mr. Lincoln delivered what was considered a thrilling and effective speech on the condition of affairs, and the duty of citizens to stand by the flag of the nation until an honorable peace was secured. It was thought probable, and would have been altogether fitting, that either Colonel Hardin, Colonel Baker, or Colonel Bissell, all of them men of intelligence and distinction, should be appointed general of the Illinois Brigade, but the Polk administration was not inclined to waste so important a place upon men who might hereafter have views of their own in public affairs. The coveted appointment was given to a man already loaded to a grotesque degree with political employment — Mr. Lincoln's old adversary, James Shields. He had left the position of Auditor of State to assume a seat on the Bench; leaving this, he had just been appointed Commissioner of the General Land Office. He had no military experience, and so far as known no capacity for the service; but his fervid partisanship and his nationality commended him to Mr. Polk as a safe servant, and he received his commission, to the surprise and derision of the State. His bravery in action and his honorable wounds at Cerro Gordo and Chapultepec saved him from contempt and made his political fortune.

He had received the recommendation of the Illinois Democrats in Congress, and it is altogether probable that he owed his appointment in great measure to the influence of Douglas, who desired to have as few Democratic statesmen as possible in Springfield that winter. A Senator was to be elected, and Shields had acquired such a habit of taking all the offices that fell vacant that it was only prudent to remove him as far as convenient from such a temptation. The election was held in December, and Douglas was promoted from the House of Representatives to that seat in the Senate which he held the rest of his life.

The session of 1846-7 opened with the Sangamon district of Illinois unrepresented in Congress. Baker had gone with his regiment to Mexico. It did not have the good fortune to participate in any of the earlier actions of the campaign, and his fiery spirit chafed in this

enforced idleness of camp and garrison. He seized an occasion which was offered him to go to Washington as bearer of dispatches, and while there he made one of those sudden and dramatic appearances in the Capitol which were so much in harmony with his tastes and his character. He went to his place on the floor,† and there delivered a bright, interesting speech in his most attractive vein, calling attention to the needs of the army, disavowing on the part of the Whigs any responsibility for the war or its conduct, and adroitly claiming for them a full share of the credit for its prosecution. He began by thanking the House for its kindness in allowing him the floor, protesting at the same time that he had done nothing to deserve such courtesy. "I could wish," he said, "that it had been the fortune of the gallant Davis‡ to now stand where I do and to receive from gentlemen on all sides the congratulations so justly due to him, and to listen to the praises of his brave compeers. For myself, I have, unfortunately, been left far in the rear of the war, and if now I venture to say a word in behalf of those who have endured the severest hardships of the struggle, whether in the blood-stained streets of Monterey, or in a yet sterner form on the banks of the Rio Grande, I beg you to believe that while I feel this a most pleasant duty, it is in other respects a duty full of pain; for I stand here, after six months' service as a volunteer, having seen no actual warfare in the field." Yet even this disadvantage he turned with great dexterity to his service. He reproached Congress for its apathy and inaction in not providing for the wants of the army by reinforcements and supplies; he flattered the troops in the field, and paid a touching tribute to those who died of disease and exposure, without ever enjoying the sight of a battle-field, and rising to lyric enthusiasm, he repeated a poem of his own, which he had written in camp to the memory of the dead of the Fourth Illinois. He could not refrain from giving his own party all the credit which could be claimed for it, and it is not difficult to imagine how exasperating it must have been to the majority to hear so calm an assumption of superior patriotism on the part of the opposition as the following: "As a Whig I still occupy a place on this floor; nor do I think it worth while to reply to such a charge as that the Whigs are not friends of their country because many of them doubt the justice or expediency of the present war. Surely there was all the more evidence of the patriotism of the man who, doubting the expediency

* The colonels were Hardin, Bissell, and Freeman.

† December 28, 1846.

‡ Jefferson Davis, who was with the army in Mexico.

and even the entire justice of the war, nevertheless supported it, because it was the war of his country. In the one it might be mere enthusiasm and an impetuous temperament; in the other it was true patriotism, a sense of duty. Homer represents Hector as strongly doubting the expediency of the war against Greece. He gave his advice against it; he had no sympathy with Paris, whom he bitterly reproached, much less with Helen; yet, when the war came, and the Grecian forces were marshaled on the plain, and their crooked keels were seen cutting the sands of the Trojan coast, Hector was a flaming fire, his beaming helmet was seen in the thickest of the fight. There are in the American army many who have the spirit of Hector; who strongly doubt the propriety of the war, and especially the manner of its commencement; who yet are ready to pour out their hearts' best blood like water, and their lives with it, on a foreign shore, in defense of the American flag and American glory."*

Immediately after making this speech, Baker increased the favorable impression created by it by resigning his seat in Congress and hurrying as fast as steam could carry him to New

Orleans, to embark there for Mexico. He had heard of the advance of Santa Anna upon Saltillo, and did not wish to lose any opportu-

This map gives the boundary between Mexico and the United States as defined by the treaty of 1828; the westerly bank of the Sabine River from its mouth to the 32d degree of latitude; thence due north to the Red River, following the course of that stream to the 100th degree of longitude west from Greenwich; thence due north to the Arkansas River, and running along its south bank to its source in the Rocky Mountains, near the place where Leadville now stands; thence due north to the 42d parallel of latitude, which it follows to the Pacific Ocean.

On the west will be seen the boundaries claimed by Mexico and the United States after the annexation of Texas. The Mexican authorities considered the western boundary of Texas to be the Nueces River, from mouth to source; thence by an indefinite line to the Rio Pecos, and through the elevated and barren Llano Estacado to the source of the main branch of the Red River, and along that river to the 100th meridian. The United States adopted the Texan claim of the Rio Grande del Norte as their western limit. By the treaty of peace of 1848, the Mexicans relinquished to the United States the territory between the Nueces and the Rio Grande del Norte; also the territory lying between the last-named river and the Pacific Ocean, and north of the Gila River and the southern boundary of New Mexico, which was a short distance above the town of El Paso.—J. W.

* We give a copy of these lines, not on account of their intrinsic merit, but as illustrating the versatility of the lawyer, orator, and soldier who wrote them.

Where rolls the rushing Rio Grande,
How peacefully they sleep!
Far from their native Northern land,
Far from the friends who weep.
No rolling drums disturb their rest
Beneath the sandy sod;
The mold lies heavy on each breast,
The spirit is with God.

They heard their country's call, and came
To battle for the right;
Each bosom filled with martial flame,
And kindling for the fight.
Light was their measured footstep when
They moved to seek the foe;

Alas that hearts so fiery then
Should soon be cold and low!

They did not die in eager strife
Upon a well-fought field;
Nor from the red wound poured their life
Where cowering foemen yield.
Death's ghastly shade was slowly cast
Upon each manly brow,
But calm and fearless to the last,
They sleep securely now.

Yet shall a grateful country give
Her honors to their name;
In kindred hearts their memory live,
And history guard their fame.
Not unremembered do they sleep
Upon a foreign strand,
Though near their graves thy wild waves sweep,
O rushing Rio Grande!

nity of fighting which might fall in the way of his regiment. He arrived to find his troops transferred to the Department of General Scott; and although he missed Buena Vista, he took part in the capture of Vera Cruz, and greatly distinguished himself at Cerro Gordo. When Shields was wounded, Baker took command of his brigade, and by a gallant charge on the Mexican guns gained possession of the Jalapa road, an act by which a great portion of the fruits of that victory were harvested.

His resignation left a vacancy in Congress, and a contest, characteristic of the politics of the time, at once sprang up over it. The rational course would have been to elect Lincoln, but, with his usual overstrained delicacy, he declined to run, thinking it fair to give other aspirants a chance for the term of two months. The Whigs nominated a respectable man named Brown, but a short while before the election John Henry, a member of the State Senate, announced himself as a candidate, and appealed for votes on the sole ground that he was a poor man and wanted the place for the mileage. Brown, either recognizing the force of this plea, or smitten with a sudden disgust for a service in which such pleas were possible, withdrew from the canvass, and Henry got his election and his mileage.

THE THIRTIETH CONGRESS.

THE Thirtieth Congress organized on the 6th of December, 1847. Its roll contained the names of many eminent men, few of whom were less known than his which was destined to a fame more wide and enduring than all the rest together. It was Mr. Lincoln's sole distinction that he was the only Whig member from Illinois. He entered upon the larger field of work which now lay before him without any special diffidence, but equally without elation. Writing to his friend Speed soon after his election he said, "Being elected to Congress, though I am very grateful to our friends for having done it, has not pleased me as much as I expected,"—an experience not unknown to most public men, but probably intensified in Lincoln's case by his constitutional melancholy. He went about his work with little gladness, but with a dogged sincerity and an inflexible conscience.

It soon became apparent that the Whigs were to derive at least a temporary advantage from the war which the Democrats had brought upon the country, although it was

* The following extract from a letter of Lincoln to his partner, Mr. Herndon, gives the names of some of the Whig soldiers who persisted in their faith throughout the war: "As to the Whig men who have participated in the war, so far as they have spoken to my hearing, they do not hesitate to denounce as unjust the President's conduct in the beginning of the war.

destined in its later consequences to sweep the former party out of existence and exile the other from power for many years. The House was so closely divided that Lincoln, writing on the 5th, expressed some doubt whether the Whigs could elect all their caucus nominees, and Mr. Robert C. Winthrop was chosen Speaker the next day by a majority of one vote. The President showed in his message that he was doubtful of the verdict of Congress and the country upon the year's operations, and he argued with more solicitude than force in defense of the proceedings of the Administration in regard to the war with Mexico. His anxiety was at once shown to be well founded. The first attempt made by his friends to indorse the conduct of the Government was met by a stern rebuke from the House of Representatives, which passed an amendment proposed by George Ashmun that "the war had been unnecessarily and unconstitutionally commenced by the President." This severe declaration was provoked and justified by the persistent and disingenuous assertion of the President that the preceding Congress had "with virtual unanimity" declared that "war existed by the act of Mexico"—the truth being that a strong minority had voted to strike out those words from the preamble of the supply bill, but being outvoted in this, they were compelled either to vote for preamble and bill together, or else refuse supplies to the army. It was not surprising that the Whigs and other opponents of the war should take the first opportunity to give the President their opinion of such a misrepresentation. The position of the opposition had been greatly strengthened by the very victories upon which Mr. Polk had confidently relied for his vindication. Both our armies in Mexico were under command of Whig generals, and among the subordinate officers who had distinguished themselves in the field, a full share were Whigs, who, to an extent unusual in wars of political significance, retained their attitude of hostility to the administration under whose orders they were serving. Some of them had returned to their places on the floor of Congress brandishing their laurels with great effect in the faces of their opponents who had talked while they fought.* When we number the names which leaped into sudden fame in that short but sanguinary war, it is surprising to find how few of them sympathized with the party which brought it on, or

They do not suppose that such denunciation is directed by undying hatred to them, as 'the Register' would have it believed. There are two such Whigs on this floor (Colonel Haskell and Major James). The former fought as a colonel by the side of Colonel Baker, at Cerro Gordo, and stands side by side with me in the vote that you seem dissatisfied with. The latter, the

with the purposes for which it was waged. The earnest opposition of Taylor to the scheme of the annexationists did not hamper his movements or paralyze his arm, when with his little band of regulars he beat the army of Arista on the plain of Palo Alto, and again in the precipitous Resaca de la Palma; took by storm the fortified city of Monterey, defended by a greatly superior force; and finally, with a few regiments of raw levies, posted among the rocky spurs and gorges about the farm of Buena Vista, met and defeated the best-led and best-fought army the Mexicans ever brought into the field, outnumbering him more than four to one. It was only natural that the Whigs should profit by the glory gained by Whig valor, no matter in what cause. The attitude of the opposition — sure of their advantage and exulting in it — was never perhaps more clearly and strongly set forth than in a speech made by Mr. Lincoln near the close of this session. He said:

“As General Taylor is *par excellence* the hero of the Mexican War, and as you Democrats say we Whigs have always opposed the war, you think it must be very awkward and embarrassing for us to go for General Taylor. The declaration that we have always opposed the war is true or false accordingly as one may understand the term ‘opposing the war.’ If to say ‘the war was unnecessarily and unconstitutionally commenced by the President’ be opposing the war, then the Whigs have very generally opposed it. Whenever they have spoken at all they have said this; and they have said it on what has appeared good reason to them; the marching of an army into the midst of a peaceful Mexican settlement, frightening the inhabitants away, leaving their growing crops and other property to destruction, to *you* may appear a perfectly amiable, peaceful, unprovoking procedure; but it does not appear so to *us*. So to call such an act, to *us* appears no other than a naked, impudent absurdity, and we speak of it accordingly. But if when the war had begun, and had become the cause of the country, the giving of our money and our blood, in common with yours, was support of the war, then it is not true that we have always opposed the war. With few individual exceptions, you have constantly had our votes here for all the necessary supplies. And, more than this, you have had the services, the blood, and the lives of our political brethren in every trial, and on every field. The beardless boy and the mature man, the humble and the distinguished, — you have had them. Through suffering and death, by disease and in battle, they have endured and fought and fallen with you. Clay and Webster each gave a son, never to be returned. From the State of my own residence, besides other worthy but less-known Whig names, we sent Marshall, Morrison, Baker, and Hardin; they all fought, and one fell, and in the fall of that one we lost our best Whig man. Nor were the Whigs few in number or laggard in the day of battle. In that fearful, bloody, breathless struggle at Buena Vista, where each man’s hard task was to beat back five foes or die himself, of the five high officers who perished, four were Whigs.”

history of whose capture with Cassius Clay you well know, had not arrived here when that vote was given; but, as I understand, he stands ready to give just such a vote whenever an occasion shall present. Baker, too, who is now here, says the truth is undoubtedly that way; and whenever he shall speak out, he will say

There was no other refuge for the Democrats after the Whigs had adopted Taylor as their especial hero, as Scott was also a Whig and an original opponent of the war. His victories have never received the credit justly due them on account of the apparent ease with which they were gained. The student of military history will rarely meet with accounts of battles in any age where the actual operations coincide so exactly with the orders issued upon the eve of conflict, as in the official reports of the wonderfully energetic and successful campaign in which General Scott with a handful of men renewed the memory of the conquest of Cortes, in his triumphant march from Vera Cruz to the capital. The plan of the battle of Cerro Gordo was so fully carried out in action that the official report is hardly more than the general orders translated from the future tense to the past. The story of Chapultepec has the same element of the marvelous in it. The general commands apparent impossibilities in the closest detail on one day, and the next day reports that they have been accomplished. These successes were not cheaply attained. The Mexicans, though deficient in science and in military intelligence, fought with bravery and sometimes with desperation. The enormous percentage of loss in his army proves that Scott was engaged in no light work. He marched from Pueblo with about ten thousand men, and his losses in the basin of Mexico were 2703, of whom 383 were officers. But neither he nor Taylor was a favorite of the Administration, and their brilliant success brought no gain of popularity to Mr. Polk and his Cabinet.

During the early part of the session little was talked about except the Mexican war, its causes, its prosecution, and its probable results. In these wordy engagements the Whigs, partly for the reasons we have mentioned, partly through their unquestionable superiority in debate, and partly by virtue of their stronger cause, usually had the advantage. There was no distinct line of demarcation, however, between the two parties. There was hardly a vote, after the election of Mr. Winthrop as Speaker, where the two sides divided according to their partisan nomenclature. The question of slavery, even where its presence was not avowed, had its secret influence upon every trial of strength in Congress, and Southern Whigs were continually found sustaining the President, and New England Democrats voting against his most cherished plans. Not

so. Colonel Doniphan, too, the favorite Whig of Missouri, and who overran all northern Mexico, on his return home, in a public speech at St. Louis, condemned the Administration in relation to the war, if I remember. G. T. M. Davis, who has been through almost the whole war, declares in favor of Mr. Clay;” etc.

even all the Democrats of the South could be relied on by the Administration. The most powerful leader of them all denounced with bitter earnestness the conduct of the war, for which he was greatly responsible. Mr. Calhoun, in an attack upon the President's policy, January 4, 1848, said, "I opposed the war, not only because it might have been easily avoided; not only because the President had no authority to order a part of the disputed territory in possession of the Mexicans to be occupied by our troops; not only because I believed the allegations upon which Congress sanctioned the war untrue, but from high considerations of policy; because I believed it would lead to many and serious evils to the country and greatly endanger its free institutions." It was probably not so much the free institutions of the country that the South Carolina Senator was disturbed about as some others. He perhaps felt that the friends of slavery had set in motion a train of events whose result was beyond their ken. Mr. Palfrey of Massachusetts a few days later said with as much sagacity as wit that "Mr. Calhoun thought that he could set fire to a barrel of gunpowder and extinguish it when half-consumed." In his anxiety that the war should be brought to an end, Calhoun proposed that the United States army should evacuate the Mexican capital, establish a defensive line, and hold it as the only indemnity possible to us. He had no confidence in treaties; and believed that no Mexican government was capable of carrying one into effect. A few days later,* in a running debate, Mr. Calhoun made an important statement which still further strengthened the contention of the Whigs. He said that in making the treaty of annexation he did not assume that the Rio del Norte was the western boundary of Texas; on the contrary, he assumed that the boundary was an unsettled one between Mexico and Texas; and that he had intimated to our *chargé d'affaires* that we were prepared to settle the boundary on the most liberal terms! This was perfectly in accordance with the position held by most Democrats before the Rio Grande boundary was made by the President an article of faith. Mr. C. J. Ingersoll, one of the leading men upon that side in Congress, in a speech three years before had said, "The stupendous deserts between the Nueces and the Bravo rivers are the natural boundaries between the Anglo-Saxon and the Mauritanian races"; a statement which, however faulty from the point of view of ethnology and physical geography, shows clearly enough the view then held of the boundary question.

* January 13, 1848.

The discipline of both parties was more or less relaxed under the influence of the slavery question. It was singular to see Mr. McLane of Baltimore rebuking Mr. Clingman of North Carolina for mentioning that forbidden subject on the floor of the House; Mr. Reverdy Johnson, a Whig from Maryland, administering correction to Mr. Hale, an insubordinate Democrat from New Hampshire, for the same offense, and at the same time screaming that the "blood of our glorious battle fields in Mexico rested on the hands of the President"; Mr. Clingman challenging the House with the broad statement that "it is a misnomer to speak of our institution at the South as peculiar; ours is the general system of the world, and the *free* system is the peculiar one," and Mr. Palfrey dryly responding that slavery was natural just as barbarism was; just as fig-leaves and bare skins were a natural dress. When the time arrived, however, for leaving off grimacing and posturing, and the House went to voting, the advocates of slavery usually carried the day, as the South, Whigs and Democrats together, voted solidly, and the North was divided. Especially was this the case after the arrival of the treaty of peace between the United States and Mexico, which was signed at Guadalupe Hidalgo on the 2d of February and was in the hands of the Senate only twenty days later. It was ratified by that body on the 10th of March, with a series of amendments which were at once accepted by Mexico, and the treaty of peace was officially promulgated on the national festival of the Fourth of July. From the hour when the treaty was received in Washington, however, the discussion as to the conduct of the war naturally languished; the ablest speeches of the day before became obsolete in the presence of accomplished facts; and the interest of Congress promptly turned to the more important subject of the disposition to be made of the vast domain which our arms had conquered and the treaty confirmed to us. No one in America then realized the magnitude of this acquisition. Its stupendous physical features were as little appreciated as the vast moral and political results which were to flow from its entrance into our commonwealth. It was only known, in general terms, that our new possessions covered ten degrees of latitude and fifteen of longitude; that we had acquired, in short, six hundred and thirty thousand square miles of desert, mountain, and wilderness. There was no dream, then, of that portentous discovery which, even while the Senate was wrangling over the treaty, had converted Captain Suttar's farm at Coloma into a mining camp — for his ruin and the sudden up-building of many colossal fortunes. The name of California, which

conveys to-day such opulent suggestions, then meant nothing but barrenness, and Nevada was a name as yet unknown — some future Congressman, innocent of taste and of Spanish, was to hit upon the absurdity of calling that land of silver and cactus, of the orange and the sage-hen, the land of snow. But imperfect as was the appreciation, at that day, of the possibilities which lay hidden in these sunset regions, there was still enough of instinctive greed in the minds of politicians to make them a subject of lively interest and intrigue.* At the first showing of hands, the South was successful.

In the twenty-ninth Congress this contest had begun over the spoils of a victory not yet achieved. President Polk, foreseeing the probability of an acquisition of territory by treaty, had asked Congress to make an appropriation for that purpose. A bill was at once reported in that sense, appropriating \$30,000 for the expenses of the negotiation and \$2,000,000 to be used in the President's discretion. But before it passed, a number of Northern Democrats† had become alarmed as to the disposition that might be made of the territory thus acquired, which was now free soil by Mexican law. After a hasty consultation they agreed upon a proviso to the bill, which was presented by Mr. David Wilmot of Pennsylvania. He was a man of respectable abilities, who then, and long afterwards, held a somewhat prominent position among the public men of his State; but his sole claim to a place in history rests upon these few lines which he moved to add to the first section of the bill under discussion:

"Provided, That as an express and fundamental condition to the acquisition of any territory from the Republic of Mexico by the United States, by virtue of any treaty that may be negotiated between them, and to the use by the Executive of the moneys herein appropriated, neither slavery nor involuntary servitude shall exist in any part of said territory, except for crime, whereof the party shall first be duly convicted."

This condition seemed so fair, when first presented to the Northern conscience, that only three members from the free States voted

* To show how crude and vague were the ideas of even the most intelligent men in relation to this great empire, we give a few lines from the closing page of E. D. Mansfield's "History of the Mexican War." "But will the greater part of this vast space ever be inhabited by any but the restless hunter and the wandering trapper? Two hundred thousand square miles of this territory, in New California, has been trod by the foot of no civilized being. No spy or pioneer or vagrant trapper has ever returned to report the character and scenery of that waste and lonely wilderness. Two hundred thousand square miles more are occupied with broken mountains and dreary wilds. But little remains then for civilization."

† Some of the more conspicuous among them were

No in committee. The amendment was adopted — 80 to 64 — and the bill reported to the House. A desperate effort was then made by the pro-slavery members to kill the bill for the purpose of destroying the amendment with it. This failed,‡ and the bill, as amended, passed the House, but going to the Senate a few hours before the close of the session, it lapsed without a vote.

As soon as the war was ended and the treaty of peace was sent to the Senate, this subject assumed a new interest and importance, and a resolution embodying the principle of the Wilmot proviso was brought before the House by Mr. Harvey Putnam of New York, but no longer with the same success. The South was now solid against it, and such a disintegration of conscience among Northern Democrats had set in, that whereas only three of them in the last Congress had seen fit to approve the introduction of slavery into free territory, twenty-five now voted with the South against maintaining the existing conditions there. The fight was kept up during the session in various places; if now and then a temporary advantage seemed gained in the House, it was lost in the Senate, and no permanent progress was made.

What we have said in regard to the general discussion provoked by the Mexican war appeared necessary to explain the part taken by Mr. Lincoln on the floor. He came to his place unheralded and without any special personal pretensions. His first participation in debate can best be described in his own quaint and simple words: § "As to speech-making, by way of getting the hang of the House, I made a little speech two or three days ago on a post-office question of no general interest. I find speaking here and elsewhere about the same thing. I was about as badly scared, and no worse, as I am when I speak in court. I expect to make one within a week or two in which I hope to succeed well enough to wish you to see it." He evidently had the orator's temperament — the mixture of dread and eagerness which all good speakers feel before facing an audience, which

Hamlin of Maine, Preston King of New York, Wilmot of Pennsylvania, Brinkerhoff of Ohio, McClelland of Michigan, etc.

‡ In this important and significant vote all the Whigs but one and almost all the Democrats, from the free States, together with Wm. P. Thomasson and Henry Grider, Whigs from Kentucky, voted against killing the amended bill, in all 93. On the other side were all the members from slave-holding States, except Thomasson and Grider, and the following from free States, Douglas and McClernand from Illinois, Petit from Indiana, and Schenck, a Whig, from Ohio, in all 79. — Greeley's "American Conflict," I. p. 189.

§ Letter to Wm. H. Herndon, January 8, 1848.

made Cicero tremble and turn pale when rising in the Forum. The speech he was pondering was made only four days later, on the 12th of January, and few better maiden speeches — for it was his first formal discourse in Congress — have ever been made in that House. He preceded it, and prepared for it, by the introduction, on the 22d of December, of a series of resolutions referring to the President's persistent assertions that the war had been begun by Mexico, "by invading our territory and shedding the blood of our citizens on our own soil," and calling upon him to give the House more specific information upon these points. As these resolutions became somewhat famous afterwards, and were relied upon to sustain the charge of a lack of patriotism made by Mr. Douglas against their author, it may be as well to give them here, especially as they are the first production of Mr. Lincoln's pen after his entry upon the field of national politics. We omit the preamble, which consists of quotations from the President's message.

Resolved by the House of Representatives. That the President of the United States be respectfully requested to inform this House:

First. Whether the spot on which the blood of our citizens was shed, as in his messages declared, was or was not within the territory of Spain, at least after the treaty of 1819, until the Mexican revolution.

Second. Whether that spot is or is not within the territory which was wrested from Spain by the revolutionary government of Mexico.

Third. Whether that spot is or is not within a settlement of people, which settlement has existed ever since long before the Texas revolution and until its inhabitants fled before the approach of the United States army.

Fourth. Whether that settlement is or is not isolated from any and all other settlements by the Gulf and the Rio Grande on the south and west, and by wide uninhabited regions in the north and east.

Fifth. Whether the people of that settlement, or a majority of them, or any of them, have ever submitted themselves to the government or laws of Texas or of the United States, by consent or by compulsion, either by accepting office, or voting at elections, or paying tax, or serving on juries, or having process served upon them, or in any other way.

Sixth. Whether the people of that settlement did or did not flee from the approach of the United States army, leaving unprotected their homes and their growing crops, *before* the blood was shed, as in the messages stated; and whether the first blood so shed was or was not shed within the inclosure of one of the people who had thus fled from it.

Seventh. Whether our citizens whose blood was shed, as in his message declared, were or were not at that time armed officers and soldiers, sent into that settlement by the military order of the President, through the Secretary of War.

Eighth. Whether the military force of the United States was or was not so sent into that settlement after General Taylor had more than once intimated to the War Department that in his opinion no such movement was necessary to the defense or protection of Texas.

It would have been impossible for the President to answer these questions, one by

one, according to the evidence in his possession, without surrendering every position he had taken in his messages for the last two years. An answer was probably not expected; the resolutions were never acted upon by the House, the vote on the Ashmun proposition having sufficiently indicated the view which the majority held of the President's precipitate and unconstitutional proceeding. But they served as a text for the speech which Lincoln made in Committee of the Whole, which deserves the attentive reading of any one who imagines that there was anything accidental in the ascendancy which he held for twenty years among the public men of Illinois. The winter was mostly devoted to speeches upon the same subject from men of eminence and experience, but it is within bounds to say there was not a speech made in the House that year superior to this, in clearness of statement, severity of criticism combined with soberness of style, or, what is most surprising, finish and correctness. In its close, clear argument, its felicity of illustration, its restrained yet burning earnestness, it belongs to precisely the same class of addresses as those which he made a dozen years later. The ordinary Congressman can never conclude inside the limits assigned him; he must beg for unanimous consent for an extension of time to come to his sprawling peroration. But this masterly speech covered the whole ground of the controversy, and so intent was Lincoln on not exceeding his hour that he finished his task, to his own surprise, in forty-five minutes. It is an admirable discourse, and the oblivion which overtook it, along with the other volumes of speeches made at the same time, can only be accounted for by remembering that the Guadalupe Treaty came suddenly in upon the debate, with its immense consequences sweeping forever out of view all consideration of the causes and the processes which led to the momentous result.

Lincoln's speech and his resolutions were alike inspired with one purpose: to correct what he considered an error and a wrong; to rectify a misrepresentation which he could not, in his very nature, permit to go uncontradicted. It gratified his offended moral sense to protest against the false pretenses which he saw so clearly, and it pleased his fancy as a lawyer to bring a truth to light which somebody, as he thought, was trying to conceal. He certainly got no other reward for his trouble. His speech was not particularly well received in Illinois. His own partner, Mr. Herndon, a young and ardent man, with more heart than learning, more feeling for the flag than for international justice, could not, or would not, understand Mr. Lincoln's

position, and gave him great pain by his letters. Again and again Lincoln explained to him the difference between approving the war and voting supplies to the soldiers, but Herndon was obstinately obtuse, and there were many of his mind. Lincoln's convictions were so positive in regard to the matter that any laxity of opinion among his friends caused him real suffering. In a letter to the Rev. J. M. Peck, who had written a defense of the Administration in reference to the origin of the war, he writes: this "disappoints me, because it is the first effort of the kind I have known, made by one appearing to me to be intelligent, right-minded, and impartial." He then reviews some of the statements of Mr. Peck, proving their incorrectness, and goes on to show that our army had marched under orders across the desert of the Nueces into a peaceful Mexican settlement, frightening away the inhabitants; that Fort Brown was built in a Mexican cotton-field, where a young crop was growing; that Captain Thornton and his men were captured in another cultivated field. He then asks, how under any law, human or divine, this can be considered "no aggression," and closes by asking his clerical correspondent if the precept, "Whatsoever ye would that men should do to you, do ye even so to them," is obsolete, of no force, of no application? This is not the anxiety of a politician troubled about his record. He is not a candidate for reelection, and the discussion has passed by; but he must stop and vindicate the truth whenever assailed. He perhaps does not see, certainly does not care, that this stubborn devotion to mere justice will do him no good at an hour when the air is full of the fumes of gunpowder; when the returned volunteers are running for constable in every county; when so good a Whig as Mr. Winthrop gives, as a sentiment, at a public meeting in Boston, "Our country, however bounded," and the majority of his party are preparing—unmindful of Mr. Polk and all his works—to reap the fruits of the Mexican war by making its popular hero President.

It was fortunate for Mr. Lincoln and for Whigs like him, with consciences, that General Taylor had occupied so unequivocal an attitude in regard to the war. He had not been in favor of the march to the Rio Grande, and had resisted every suggestion to that effect until his peremptory orders came. In regard to other political questions, his position was so undefined, and his silence generally so discreet, that few of the Whigs, however exacting, could find any difficulty in supporting him. Mr. Lincoln did more than

tolerate his candidacy. He supported it with energy and cordiality. He was at last convinced that the election of Mr. Clay was impossible, and he thought he could see that the one opportunity of the Whigs was in the nomination of Taylor. So early as April he wrote to a friend: * "Mr. Clay's chance for an election is just no chance at all. He might get New York, and that would have elected in 1844, but it will not now, because he must now, at the least, lose Tennessee, which he had then, and in addition the fifteen new votes of Florida, Texas, Iowa, and Wisconsin." Later he wrote to the same friend that the nomination took the Democrats "on the blind side. It turns the war thunder against them. The war is now to them the gallows of Haman, which they built for us, and on which they are doomed to be hanged themselves."

At the same time he bated no jot of his opposition to the war, and urged the same course upon his friends. To Linder of Illinois he wrote: † "In law, it is good policy to never plead what you need not, lest you oblige yourself to prove what you cannot." He then counsels him to go for Taylor, but to avoid approving Polk and the war, as in the former case he will gain Democratic votes and in the latter he would lose with the Whigs. Linder answered him, wanting to know if it would not be as easy to elect Taylor without opposing the war, which drew from Lincoln the angry response that silence was impossible; the Whigs must speak, "and their only option is whether they will, when they speak, tell the truth or tell a foul and villainous falsehood."

When the Whig Convention came together in Philadelphia, ‡ the differences of opinion on points of principle and policy were almost as numerous as the delegates. The unconditional Clay men rallied once more and gave their aged leader ninety-seven votes to one hundred and eleven which Taylor received on the first ballot. Scott and Webster had each a few votes; but on the fourth ballot the soldier of Buena Vista was nominated, and Millard Fillmore placed in the line of succession to him. It was impossible for a body so heterogeneous to put forward a distinctive platform of principles. An attempt was made to force an expression in regard to the Wilmot proviso, but it was never permitted to come to a vote. The convention was determined that "Old Rough and Ready," as he was now universally nicknamed, should run upon his battle-flags and his name of Whig—although he cautiously called himself "not an ultra Whig." The nomination was received with great and noisy demonstrations of adhesion from every

* Archibald Williams of Quincy, Illinois. Lamon, p. 294.

† Holland, p. 118.

‡ June 7, 1848.

quarter. Lincoln, writing a day or two after his return from the convention, says: "Many had said they would not abide the nomination of Taylor; but since the deed has been done they are fast falling in, and in my opinion we shall have a most overwhelming, glorious triumph. One unmistakable sign is that all the odds and ends are with us,—Barnburners, native Americans, Tyler men, disappointed office-seeking Loco-focos, and the Lord knows what. This is important, if in nothing else, in showing which way the wind blows."

General Taylor's chances for election had been greatly increased by what had taken place at the Democratic Convention, a fortnight before. General Cass had been nominated for the Presidency, but his militia title had no glamour of carnage about it, and the secession of the New York Antislavery "Barnburners" from the convention was a presage of disaster which was fulfilled in the following August by the assembling of the recusant delegates at Buffalo, where they were joined by a large number of discontented Democrats and "Liberty" men, and the Free-soil party was organized for its short but effective mission. Martin Van Buren was nominated for President, and Charles Francis Adams was associated with him on the ticket. The great superiority of caliber shown in the nominations of the mutineers over the regular Democrats was also apparent in the roll of those who made and sustained the revolt. When Salmon P. Chase, Charles Sumner, Preston King, the Van Burens and Adamses, John P. Hale, Henry Wilson, William Cullen Bryant, David Wilmot, and their like went out of their party, they left a vacancy which was never to be filled. It was perhaps an instinct rather than any clear spirit of prophecy which drove the antislavery Democrats out of their party and kept the Whigs together. So far as the authorized utterances of their conventions were concerned, there was little to choose between them. They had both evaded any profession of faith in regard to slavery. The Democrats had rejected the resolution offered by Yancey committing them to the doctrine of "non-interference with the rights of property in the territories," and the Whigs had never allowed the Wilmot proviso to be voted upon. But nevertheless those Democrats who felt that the time had come to put a stop to the aggression of slavery, generally threw off their partisan allegiance, and the most ardent of the antislavery Whigs, with not many exceptions,

thought best to remain with their party. General Taylor was a Southerner and a slaveholder. In regard to all questions bearing upon slavery, he observed a discretion in the canvass which was almost ludicrous.* Yet there was a well-nigh universal impression among the antislavery Whigs that his administration would be under influences favorable to the restriction of slavery. Clay, Webster, and Seward, all of whom were agreed at that time against any extension of the area of that institution, heartily supported him. Webster insisted upon it that the Whigs were themselves the best "Free-soilers," and for them to join the party called by that distinctive name would be merely putting Mr. Van Buren at the head of the Whig party. Mr. Seward, speaking for Taylor at Cleveland,† took still stronger ground, declaring that slavery "must be abolished"; that "freedom and slavery are two antagonistic elements of society in America"; that "the party of freedom seeks complete and universal emancipation." No one then seems to have foreseen that the Whig party—then on the eve of a great victory—was so near its dissolution, and that the bolting Democrats and the faithful Whigs were alike engaged in laying the foundations of a party which was to illustrate the latter half of the century with achievements of such colossal and enduring importance.

There was certainly no doubt or misgiving in the mind of Lincoln as to that future, which, if he could have foreseen it, would have presented so much of terrible fascination. He went into the campaign with exultant alacrity. He could not even wait for the adjournment of Congress to begin his stump-speaking. Following the bad example of the rest of his colleagues, he obtained the floor on the 27th of July, and made a long, brilliant, and humorous speech upon the merits of the two candidates before the people. As it is the only one of Lincoln's popular speeches of that period which has been preserved entire, it should be read by those who desire to understand the manner and spirit of the politics of 1848. Whatever faults of taste or of method may be found in it, considering it as a speech delivered in the House of Representatives, with no more propriety or pertinence than hundreds of others which have been made under like circumstances, it is an extremely able speech, and it is by itself enough to show how remarkably effective he must have been as a canvasser in the remoter districts of his State where means

* It is a tradition that a planter once wrote to him: "I have worked hard and been frugal all my life, and the results of my industry have mainly taken the form of slaves, of whom I own about a hundred. Before I vote for President I want to be sure that the candidate I support will not so act as to divest me of my property." To which the general, with a dexterity that would have

done credit to a diplomatist, and would have proved exceedingly useful to Mr. Clay, responded, "Sir: I have the honor to inform you that I too have been all my life industrious and frugal, and that the fruits thereof are mainly invested in slaves, of whom I own *three* hundred. Yours, etc."—Greeley's "American Conflict," I. p. 199.

† October 26, 1848.

of intellectual excitement were rare and a political meeting was the best-known form of public entertainment. He begins by making a clear, brief, and dignified defense of the position of Taylor upon the question of the proper use of the veto; he then avows with characteristic candor that he does not know what General Taylor will do as to slavery; he is himself "a Northern man, or rather a Western free-State man, with a constituency I believe to be, and with personal feelings I know to be, against the extension of slavery" (a definition in which his caution and his honesty are equally displayed), and he hopes General Taylor would not, if elected, do anything against its restriction; but he would vote for him in any case, as offering better guarantees than Mr. Cass. He then enters upon an analysis of the position of Cass and his party which is full of keen observation and political intelligence, and his speech goes on to its rollicking close with a constant succession of bright, witty, and striking passages in which the orator's own conviction and enjoyment of an assured success is not the least remarkable feature. A few weeks later Congress adjourned, and Lincoln, without returning home, entered upon the canvass in New England,* and then going to Illinois, spoke night and day until the election. When the votes were counted, the extent of the defection among the Northern Democrats who voted for Van Buren and among the Southern Democrats who had been beguiled by the epaulets of Taylor, was plainly seen. The "Free-soilers" had given several important Northern States, by small pluralities, to the Whigs, carrying no electors, but having more votes than Cass in New York, Massachusetts, and Vermont. The entire popular vote (exclusive of South Carolina, which chose its electors by the Legislature) was for Taylor 1,360,752; for Cass 1,219,962; for Van Buren 291,342. Of the electors, Taylor had 163 and Cass 137.

A FORTUNATE ESCAPE.

WHEN Congress came together again in December, there was such a change in the temper of its members that no one would have imagined, on seeing the House divided, that it was the same body which had assembled there a year before. The election was over; the Whigs were to control the Executive Department of the government for four

years to come; the members themselves were either reëlected or defeated; and there was nothing to prevent the gratification of such private feelings as they might have been suppressing during the canvass in the interest of their party. It was not long before some of the Northern Democrats began to avail themselves of this new liberty. They had returned burdened with a sense of wrong. They had seen their party beaten in several Northern States by reason of its fidelity to the South, and they had seen how little their Southern brethren cared for their labors and sacrifices, in the enormous gains which Taylor had made in the South, carrying eight out of fifteen slave States. They were in the humor to avenge themselves by a display of independence on their own account, at the first opportunity. The occasion was not long in presenting itself. A few days after Congress opened, Mr. Root of Ohio introduced a resolution instructing the Committee on Territories to bring in a bill "with as little delay as practicable" to provide territorial governments for California and New Mexico, which should "exclude slavery therefrom." This resolution would have thrown the same House into a panic twelve months before, but now it passed by a vote of 108 to 80—in the former number were all the Whigs from the North and all the Democrats but eight, and in the latter the entire South and the eight referred to.

The Senate, however, was not so susceptible to popular impressions, and the bill, prepared in obedience to the mandate of the House, never got farther than the desk of the Senate Chamber. The pro-slavery majority in that body held firmly together till near the close of the session, when they attempted to bring in the new territories without any restriction as to slavery, by attaching what is called "a rider" to that effect, to the Civil Appropriation Bill. The House resisted, and returned the bill to the Senate with the rider unhorsed. A committee of conference failed to agree. Mr. McClelland, a Democrat from Illinois, then moved that the House recede from its disagreement, which was carried by a few Whig votes, to the dismay of those who were not in the secret, when Richard W. Thompson (who was thirty years afterwards Secretary of the Navy) instantly moved that the House do concur with the Senate, with this amendment, that the existing laws of those

*Thurlow Weed says in his Autobiography, Vol. I. p. 603: "I had supposed, until we now met, that I had never seen Mr. Lincoln, having forgotten that in the fall of 1848, when he took the stump in New England, he called upon me at Albany, and that we went to see Mr. Fillmore, who was then the Whig candidate for Vice-President." The New York "Tribune," September 14, 1848, mentions Mr. Lincoln as addressing a

great Whig meeting in Boston, September 12. The Boston "Atlas" refers to speeches made by him at Dorchester, September 16; at Chelsea, September 17; by Lincoln and Seward at Boston, September 22, on which occasion the report says: "Mr. Lincoln of Illinois next came forward, and was received with great applause. He spoke about an hour and made a powerful and convincing speech which was cheered to the echo."

territories be for the present and until Congress should amend them, retained. This would secure them to freedom, as slavery had long ago been abolished by Mexico. This amendment passed, and the Senate had to face the many-pronged dilemma, either to defeat the Appropriation Bill, to consent that the territories should be organized as free communities, or to swallow their protestations that the territories were in sore need of government and adjourn, leaving them in the anarchy they had so feelingly depicted. They chose the last as the least dangerous course, and passed the Appropriation Bill in its original form.

Mr. Lincoln took little part in the discussions incident to these proceedings; he was constantly in his seat, however, and voted generally with his party, and always with those opposed to the extension of slavery. He used to say that he had voted for the Wilmot proviso, in its various phases, forty-two times. He left to others, however, the active work on the floor. His chief preoccupation during this second session was a scheme which links itself characteristically with his first protest against the proscriptive spirit of slavery ten years before in the Illinois Legislature and his immortal act fifteen years afterwards in consequence of which American slavery ceased to exist. He had long felt in common with many others that the traffic in human beings under the very shadow of the Capitol was a national scandal and reproach. He thought that Congress had the power under the Constitution to regulate or prohibit slavery in all regions under its exclusive jurisdiction, and he thought it proper to exercise that power with due regard to vested rights and the general welfare. He therefore resolved to test the question whether it were possible to remove from the seat of government this stain and offense. He proceeded carefully and cautiously about it, after his fashion. When he had drawn up his plan, he took counsel with some of the leading citizens of Washington and some of the more prominent members of Congress before bringing it forward. His bill obtained the cordial approval of Colonel Seaton, the Mayor of Washington, whom Mr. Lincoln had consulted as the representative of the intelligent slave-holding citizens of the District, and of Joshua F. Giddings,* whom he regarded as the leading abolitionist in Congress, a fact which sufficiently proves the practical wisdom with which he had reconciled the demands of right and expediency. In the mean time, however, Mr. Gott, a member from New York, had introduced a resolution with a rhetorical preamble directing the proper committee to

bring in a bill prohibiting the slave-trade in the District. This occasioned great excitement, much caucusing and threatening on the part of the Southern members, but nothing else. In the opinion of the leading antislavery men, Mr. Lincoln's bill, being at the same time more radical and more reasonable, was far better calculated to effect its purpose. Giddings says in his diary: "This evening (January 11), our whole mess remained in the dining-room after tea, and conversed upon the subject of Mr. Lincoln's bill to abolish slavery. It was approved by all; I believe it as good a bill as we could get at this time, and was willing to pay for slaves in order to save them from the Southern market, as I suppose every man in the District would sell his slaves if he saw that slavery was to be abolished." Mr. Lincoln therefore moved, on the 16th of January, as an amendment to Gott's proposition, that the committee report a bill for the total abolition of slavery in the District of Columbia, the terms of which he gave in full. They were in substance the following:

The first two sections prohibit the bringing of slaves into the district or selling them out of it, provided, however, that officers of the Government, being citizens of slave-holding States, may bring their household servants with them for a reasonable time and take them away again. The third provides a temporary system of apprenticeship and eventual emancipation for children born of slave-mothers after January 1st, 1850. The fourth provides for the manumission of slaves by the Government on application of the owners, the latter to receive their full cash value. The fifth provides for the return of fugitive slaves from Washington and Georgetown. The sixth submits this bill itself to a popular vote in the District as a condition of its promulgation as law.

These are the essential points of the measure, and the success of Mr. Lincoln in gaining the adhesion of the abolitionists in the House is more remarkable than that he should have induced the Washington Conservatives to approve it. But the usual result followed as soon as it was formally introduced to the notice of Congress. It was met by that violent and excited opposition which greeted any measure, however intrinsically moderate and reasonable, which was founded on the assumption that slavery was not in itself a good and desirable thing. The social influences of Washington were brought to bear against a proposition which the Southerners contended would vulgarize society, and the genial and liberal mayor was forced to withdraw his approval as gracefully or as awkwardly as he might. The prospects of the bill were seen to be hopeless, as the session was to end on the 4th of March, and

* Giddings's diary, January 8, 9, and 11, 1849: published in "Cleveland Post," March 31, 1878.

no further effort was made to carry it through. Fifteen years afterwards, in the stress and tempest of a terrible war, it was Mr. Lincoln's strange fortune to sign a bill sent him by Congress for the abolition of slavery in Washington; and perhaps the most remarkable thing about the whole transaction was that while we were looking politically upon a new heaven and a new earth—for the vast change in our moral and economic condition might justify so audacious a phrase—when there was scarcely a man on the continent who had not greatly shifted his point of view in a dozen years, there was so little change in Mr. Lincoln. The same hatred for slavery, the same sympathy with the slave, the same consideration for the slaveholder as the victim of a system he had inherited, the same sense of divided responsibility between the South and the North, the same desire to effect great reforms with as little individual damage and injury, as little disturbance of social conditions as possible, were equally evident when the raw pioneer signed the protest with Dan Stone at Vandalia, when the mature man moved the resolution in 1849 in the Capitol, and when the President gave the sanction of his bold signature to the act which swept away the slave-shambles from the city of Washington.

His term in Congress ended on the 4th of March, and he was not a candidate for reelection. A year before he had contemplated the possibility of entering the field again. He then wrote to his friend and partner Herndon: "It is very pleasant for me to learn from you that there are some who desire that I should be reelected. I most heartily thank them for the kind partiality; and I can say, as Mr. Clay said of the annexation of Texas, that 'personally I would not object' to a reelection, although I thought at the time (of his nomination), and still think, it would be quite as well for me to return to the law at the end of a single term. I made the declaration that I would not be a candidate again, more from a wish to deal fairly with others, to keep peace among our friends, and keep the district from going to the enemy, than for any cause personal to myself, so that, if it should so happen that nobody else wishes to be elected, I could not refuse the people the right of sending me again. But to enter myself as a competitor of others, or to authorize any one so to enter me, is what my word and honor forbid." But before his first session ended he gave up all idea of going back, and heartily concurred in the nomination of Judge Logan to succeed him. The Sangamon district was the one which the Whigs of Illinois had apparently the best prospect of carrying, and it was full of able and ambitious men, who were nomi-

inated successively for the only place which gave them the opportunity of playing a part in the national theater at Washington. They all served with more or less distinction, but for ten years no one was ever twice a candidate. A sort of tradition had grown up, through which a perverted notion of honor and propriety held it discreditable in a member to ask for reelection. This state of things was not peculiar to that district, and it survives with more or less vigor throughout the country to this day, to the serious detriment of Congress. This consideration, coupled with what is called the claim of locality, must in time still further deteriorate and degrade the representatives of the States at Washington. To ask in a nominating convention who is best qualified for service in Congress is always regarded as an impertinence; but the question "what county in the district has had the Congressman oftenest" is always considered in order. For such reasons as these Mr. Lincoln refused to allow his name to go before the voters again, and the next year he again refused, writing an emphatic letter for publication, in which he said that there were many Whigs who could do as much as he "to bring the district right side up."

Colonel Baker had come back from the wars with all the glitter of Cerro Gordo about him, but did not find the prospect of political preferment flattering in Sangamon County, and therefore, with that versatility and sagacity which was more than once to render him signal service, he removed to the Galena district, in the extreme north-western corner of the State, and almost immediately on his arrival there received a nomination to Congress. He was doubly fortunate in this move, as the nomination he was unable to take away from Logan proved useless to the latter, who was defeated after a hot contest. Baker therefore took the place of Lincoln as the only Whig member from Illinois, and their names occur frequently together in the arrangements for the distribution of "Federal patronage" at the close of the Administration of Polk and the beginning of that of Taylor. During the period while the President elect was considering the appointment of his Cabinet, Lincoln used all the influence he could bring to bear, which was probably not very much, in favor of Baker for a place in the Government. The Whig members of the Legislatures of Illinois, Iowa, and Wisconsin joined in this effort, which came to nothing.* The recommendations to office which Lincoln made after the inauguration of General Taylor are probably unique of their kind. Here is a specimen which is short enough to give entire. It is addressed to the Secretary of the Interior:

* MS. letter from Lincoln to Schooler, Feb. 2, 1849.

"I recommend that William Butler be appointed Pension Agent for the Illinois agency when the place shall be vacant. Mr. Hurst, the present incumbent, I believe has performed the duties very well. He is a decided partisan, and I believe expects to be removed. Whether he shall be, I submit to the Department. This office is not confined to my district, but pertains to the whole State; so that Colonel Baker has an equal right with myself to be heard concerning it. However, the office is located here (at Springfield); and I think it is not probable any one would desire to remove from a distance to take it." We have examined a large number of his recommendations — for with a complete change of administration there would naturally be great activity among the office-seekers — and they are all in precisely the same vein. He nowhere asks for the removal of an incumbent; he never claims a place as subject to his disposition; in fact, he makes no personal claim whatever; he simply advises the Government, in case a vacancy occurs, who, in his opinion, is the best man to fill it. When there are two applicants, he indicates which is on the whole the better man, and sometimes adds that the weight of recommendations is in favor of the other! In one instance he sends forward the recommendations of the man whom he does not prefer, with an indorsement emphasizing the importance of them, and adding: "From personal knowledge I consider Mr. Bond every way worthy of the office and qualified to fill it. Holding the individual opinion that the appointment of a different gentleman would be better, I ask especial attention and consideration for his claims, and for the opinions expressed in his favor by those over whom I can claim no superiority." The candor, the fairness and moderation, together with the respect for the public service which these recommendations display, are all the more remarkable when we reflect that there was as yet no sign of a public conscience upon the subject. The patronage of the Government was scrambled for, as a matter of course, in the mire into which Jackson had flung it.

For a few weeks in the spring of 1849 Mr. Lincoln appears in a character which is en-

tirely out of keeping with all his former and subsequent career. He became, for the first and only time in his life, an applicant for an appointment at the hands of the President. His bearing in this attitude was marked by his usual individuality. In the opinion of many Illinoisans it was important that the place of Commissioner of the General Land Office should be given to a citizen of their State, one thoroughly acquainted with the land law in the West and the special needs of that region. A letter to Lincoln was drawn up and signed by some half-dozen of the leading Whigs of the State asking him to become an applicant for that position. He promptly answered, saying that if the position could be secured for a citizen of Illinois only by his accepting it, he would consent; but he went on to say that he had promised his best efforts to Cyrus Edwards for that place, and had afterwards stipulated with Colonel Baker that if J. L. D. Morrison, another Mexican hero, and Edwards could come to an understanding with each other as to which should withdraw, he would join in recommending the other; that he could not take the place, therefore, unless it became clearly impossible for either of the others to get it. Some weeks later, the impossibility referred to having become apparent, Mr. Lincoln applied for the place; but a suitor for office so laggard and so scrupulous as he stood very little chance of success in a contest like those which periodically raged at Washington during the first weeks of every new administration. The place came, indeed, to Illinois, but to neither of the three we have mentioned. The fortunate applicant was Justin Butterfield of Chicago, a man well and favorably known among the early members of the Illinois bar* and an intimate friend of Lincoln. He possessed, however, too practical a mind to permit the claims of friendship to interfere with the business of office-seeking, which he practiced with fair success all his days.

It was in this way that Abraham Lincoln met and escaped one of the greatest dangers of his life. In after days he recognized the error he had committed, and congratulated himself upon the happy deliverance he had obtained through no merit of his own. The loss of at

* Butterfield had a great reputation for ready wit and was suspected of deep learning. Some of his jests are still repeated by old lawyers in Illinois, and show at least a well-marked humorous intention. On one occasion he appeared before Judge Pope to ask the discharge of the famous Mormon Prophet Joe Smith, who was in custody surrounded by his church dignitaries. Bowing profoundly to the court and the ladies who thronged the hall, he said, "I appear before you under solemn and peculiar circumstances. I am to address the Pope, surrounded by angels, in the presence of the holy apostles, in behalf of the Prophet of the Lord." We once heard Lincoln say of Butter-

field that he was one of the few Whigs in Illinois who approved the Mexican War. His reason, frankly given, was that he had lost an office in New York by opposing the war of 1812. "Henceforth," he said with cynical vehemence, "I am for war, pestilence, and famine." He was once defending the Shawnee-town Bank and advocating the extension of its charter; an opposing lawyer contended that this would be creating a new bank. Butterfield brought a smile from the court and a laugh from the bar by asking "whether when the Lord lengthened the life of Hezekiah he made a new man, or whether it was the same old Hezekiah?"

least four years of the active pursuit of his profession would have been irreparable, leaving out of view the strong probability that the singular charm of Washington life to men who have a passion for politics might have kept him there forever. It has been said that a residence in Washington leaves no man precisely as it found him. This is an axiom which may be applied to most cities in a certain sense, but it is true in a peculiar degree of our capital. To the men who come there from small rural communities in the South and the West, the bustle and stir, the intellectual movement, such as it is, the ordinary subjects of conversation, of such vastly greater importance than anything they have previously known, the daily and hourly combats on the floor of both houses, the intrigue and the struggle of office-hunting, which interest vast numbers besides the office-seekers, the superior piquancy and interest of the scandal which is talked at a Congressional boarding-house over that which seasons the dull days at a village-tavern,—all this gives a savor to life in Washington, the memory of which doubles the tedium of the sequestered vale to which the beaten legislator returns when his brief hour of glory is over. It is this which brings to the State Department, after every general election, that crowd of specters, with their bales of recommendations from pitying colleagues who have been reëlected, whose diminishing prayers run down the whole gamut of supplication from St. James to St. Paul of Loando, and of whom at the last it must be said, as Mr. Evarts once said after an unusually heavy day, “Many called, but few chosen.” Of those who do not achieve the ruinous success of going abroad to consulates that will not pay their board, or missions where they only avoid daily shame by hiding their penury and their ignorance away from observation, a great portion yield to their fate and join that fleet of wrecks which floats forever on the pavement of Washington.

It is needless to say that Mr. Lincoln received no damage from his term of service in Washington, but we know of nothing which shows so strongly the perilous fascination of the place as the fact that a man of his extraordinary moral and mental qualities could ever have thought for a moment of accepting a position so insignificant and incongruous as that which he was more than willing to assume when he left Congress. He would have filled the place with honor and credit—but at a monstrous expense. We do not so much refer to his exceptional career and his great figure in history; these momentous contingencies could not have suggested themselves to him. But the place he was reasonably sure

of filling in the battle of life should have made a subordinate office in Washington a thing out of the question. He was already a lawyer of skill and reputation; an orator upon whom his party relied to speak for them to the people. An innate love of combat was in his heart; he loved discussion like a medieval schoolman. The air was already tremulous with faint bugle-notes that heralded a conflict of giants on a field of moral significance to which he was fully alive and awake, where he was certain to lead at least his hundreds and his thousands. Yet if Justin Butterfield had not been a more supple, more adroit, and less scrupulous suitor for office than himself, Abraham Lincoln would have sat for four inestimable years at a bureau-desk in the Interior Department, and when the hour of action sounded in Illinois, who would have filled the place which he took as if he had been born for it? Who could have done the duty which he bore as lightly as if he had been fashioned for it from the beginning of time?

His temptation did not even end with Butterfield's success. The administration of General Taylor, apparently feeling that some compensation was due to one so earnestly recommended by the leading Whigs of the State, offered Mr. Lincoln the governorship of Oregon. This was a place more suited to him than the other, and his acceptance of it was urged by some of his most judicious friends* on the ground that the new Territory would soon be a State, and that he could come back as a senator. This view of the matter commended itself favorably to Lincoln himself, who, however, gave it up on account of the natural unwillingness of his wife to remove to a country so wild and so remote.

This was all as it should be. The best place for him was Illinois, and he went about his work there until his time should come.

SIX YEARS OF LAW PRACTICE.

IN that briefest of all autobiographies, which Mr. Lincoln wrote for Jesse Fell upon three pages of note-paper, he sketched the period at which we have arrived in these words: “From 1849 to 1854, both inclusive, I practiced law more assiduously than ever before. . . . I was losing interest in politics, when the repeal of the Missouri Compromise aroused me again.” His service in Congress had made him more generally known than formerly, and had increased his practical value as a member of any law firm. He was offered a partnership on favorable terms by a lawyer in good practice in Chicago; but he declined it on the

* Among others John T. Stuart, who is our authority for this statement.

ROBERT C. WINTHROP. (AFTER A PHOTOGRAPH BY BRADY.)

ground that his health would not endure the close confinement necessary in a city office. He went back to Springfield, and resumed at once his practice there and in the Eighth Judicial Circuit, where his occupations and his associates were the most congenial that he could anywhere find. For five years he devoted himself to his work with more energy and more success than ever before.

It was at this time that he gave a notable proof of his unusual powers of mental discipline. His wider knowledge of men and things, acquired by contact with the great world, had shown him a certain lack in himself of the power of close and sustained reasoning. To remedy this defect, he applied himself, after his return from Congress, to such works upon logic and mathematics as he fancied would

be serviceable. Devoting himself with dogged energy to the task in hand, he soon learned by heart six books of the propositions of Euclid, and he retained through life an intimate knowledge of the principles they contain.

The outward form and fashion of every institution change rapidly in growing communities like our Western States, and the practice of the law had already assumed a very different degree of dignity and formality from that which it presented only twenty years before. The lawyers in hunting-shirts and moccasins had long since passed away; so had the judges who apologized to the criminals that they sentenced, and charged them "to let their friends on Bear Creek understand it was the law and jury who were responsible." Even the easy familiarity of a later date would no longer be tolerated. No successor of Judge Douglas had been known to follow his example by coming down from the bench, taking a seat in the lap of a friend, throwing an arm around his neck, and in that intimate attitude discussing, *coram publico*, whatever interested him.* David Davis—afterwards of the Supreme Court and of the Senate—was for many years the presiding judge of this circuit, and neither under him nor his predecessor, S. H. Treat, was any lapse of dignity or of propriety possible. Still there was much less of form and ceremony insisted upon than is considered proper and necessary in older communities. The bar in great measure was composed of the same men who used to follow the circuit on horseback, over roads impossible to wheels, with their scanty wardrobes, their law-books, and their documents

crowding each other in their leather saddlebags. The improvement of roads which made carriages a possibility had effected a great change, and the coming of the railway had completed the sudden development of the manners and customs of the modernized community. But they could not all at once take from the bar of the Eighth Circuit its raciness and its individuality. The men who had lived in log-cabins, who had hunted their way through untrodden woods and prairies, who had thought as much about the chances of swimming over swollen fords as of their cases, who had passed their nights—a half-dozen together—on the floors of wayside hostleries, could never be precisely the same sort of

DAVID DAVIS (1862-66.) (AFTER A PHOTOGRAPH BY BRADY.)

practitioners as the smug barristers of a more conventional age and place. But they were not deficient in ability, in learning, or in that most valuable faculty which enables really intelligent men to get their bearings and sustain themselves in every sphere of life to which they may be called. Some of these very colleagues of Lincoln at the Springfield bar have sat in Cabinets, have held their own on the floor of the Senate, have led armies in the field, have governed States, and all with a quiet self-reliance which was as far as possible removed from either undue arrogance or undue modesty.*

Among these able and energetic men Lincoln assumed and held the first rank. This is a statement which ought not to be made without authority, and rather than give the common repute of the circuit, we prefer to cite the opinion of those lawyers of Illinois who are

entitled to speak as to this matter, both by the weight of their personal and professional character and by their eminent official standing among the jurists of our time. We shall quote rather fully from addresses delivered by Justice David Davis, of the Supreme Court of the United States, and by Judge Drummond, the United States District Judge for Illinois.

Judge Davis says:

"I enjoyed for over twenty years the personal friendship of Mr. Lincoln. We were admitted to the bar about the same time and traveled for many years what is known in Illinois as the Eighth Judicial Circuit. In 1848, when I first went on the bench, the circuit embraced fourteen counties, and Mr. Lincoln went with the court to every county. Railroads were not then in use, and our mode of travel was either on horseback or in buggies.

"This simple life he loved, preferring it to the practice of the law in a city, where, although the remuneration would be greater, the opportunity would be less for mixing with the great body of the people, who loved

* A few of the lawyers who practiced with Lincoln, and have held the highest official positions, are Douglas,

Shields, Logan Stuart, Baker, Treat, Bledsoe, Brown-
ing, Hardin, Trumbull, McClernand, etc.

MARTIN VAN BUREN, PRESIDENT FROM 1837-41.

him, and whom he loved. Mr. Lincoln was transferred from the bar of that circuit to the office of the President of the United States, having been without official position since he left Congress in 1849. In all the elements that constitute the great lawyer he had few equals. He was great both at *nisi prius* and before an appellate tribunal. He seized the strong points of a cause, and presented them with clearness and great compactness. His mind was logical and direct, and he did not indulge in extraneous discussion. Generalities and platitudes had no charms for him. An unfailing vein of humor never deserted him; and he was able to claim the attention of court and jury, when the cause was the most uninteresting, by the appropriateness of his anecdotes.

“His power of comparison was large, and he rarely failed in a legal discussion to use that mode of reasoning. The framework of his mental and moral being was honesty, and a wrong cause was poorly defended by him. The ability which some eminent lawyers possess, of explaining away the bad points of a cause by ingenious sophistry, was denied him. In order to bring into full activity his great powers, it was necessary that he should be convinced of the right and justice of the matter which he advocated. When so convinced, whether the cause was great or small, he was usually successful. He read law-books but little, except when the cause in hand made it necessary; yet he was usually self-reliant, depending on his own resources, and rarely consulting his brother lawyers,

either on the management of his case or on the legal questions involved.

"Mr. Lincoln was the fairest and most accommodating of practitioners, granting all favors which were consistent with his duty to his client, and rarely availing himself of an unwary oversight of his adversary.

"He hated wrong and oppression everywhere, and many a man whose fraudulent conduct was undergoing review in a court of justice has writhed under his terrific indignation and rebukes. He was the most

COLONEL W. W. SEATON. (AFTER A PHOTOGRAPH BY BRADY.)

simple and unostentatious of men in his habits, having few wants, and those easily supplied. To his honor be it said that he never took from a client, even when his cause was gained, more than he thought the services were worth and the client could reasonably afford to pay. The people where he practiced law were not rich, and his charges were always small. When he was elected President, I question whether there was a lawyer in the circuit, who had been at the bar so long a time, whose means were not larger. It did not seem to be one of the purposes of his life to accumulate a fortune. In fact, outside of his profession, he had no knowledge of the way to make money, and he never even attempted it.

"Mr. Lincoln was loved by his brethren of the bar, and no body of men will grieve more at his death, or pay more sincere tributes to his memory. His presence on the circuit was watched for with interest, and never failed to produce joy or hilarity. When casually absent, the spirits of both bar and people were depressed. He was not fond of litigation, and would compromise a lawsuit whenever practicable."

No clearer or more authoritative statement of Lincoln's rank as a lawyer can ever be made than is found in these brief sentences, in which the warmth of personal affection is not permitted to disturb the measured appreciation, the habitual reserve of the eminent jurist. But, as it may be objected that the friendship which united Davis and Lincoln rendered the one incapable of a just judgment upon the merits of the other, we

will also give an extract from the address delivered in Chicago by one of the ablest and most impartial lawyers who have ever honored the bar and the bench in the West. Judge Drummond says:

"With a probity of character known to all, with an intuitive insight into the human heart, with a clearness of statement which was in itself an argument, with uncommon power and felicity of illustration,—often, it is true, of a plain and homely kind,—and with that sincerity and earnestness of manner which carried conviction, he was perhaps one of the most successful jury lawyers we ever had in the State. He always tried a case fairly and honestly. He never intentionally misrepresented the evidence of a witness nor the argument of an opponent. He met both squarely, and if he could not explain the one or answer the other, substantially admitted it. He never misstated the law, according to his own intelligent view of it. Such was the transparent candor and integrity of his nature, that he could not well or strongly argue a side or a cause that he thought wrong. Of course he felt it his duty to say what could be said, and to leave the decision to others; but there could be seen in such cases the inward struggle of his own mind. In trying a case he might occasionally dwell too long upon, or give too much importance to, an inconsiderable point; but this was the exception, and generally he went straight to the citadel of the cause or question, and struck home there, knowing if that were won the outworks would necessarily fall. He could hardly be called very learned in his profession, and yet he rarely tried a cause without fully understanding the law applicable to it; and I have no hesitation in saying he was one of the ablest lawyers I have ever known. If he was forcible before a jury, he was equally so with the court. He detected with unerring sagacity the weak points of an opponent's argument, and pressed his own views with overwhelming strength. His efforts were quite unequal, and it might happen that he would not, on some occasions, strike one as at all remarkable. But let him be thoroughly roused, let him feel that he was right, and that some principle was involved in his cause, and he would come out with an earnestness of conviction, a power of argument, a wealth of illustration, that I have never seen surpassed."

This is nothing less than the portrait of a great lawyer, drawn by competent hands, with the life-long habit of conscientious accuracy. If we chose to continue we could fill this volume with the tributes of his professional associates, ranging all the way from the commonplaces of condolence to the most extravagant eulogy. But enough has been quoted to justify the tradition which Lincoln left behind him at the bar of Illinois. His weak as well as his strong qualities have been indicated. He never learned the technicalities, what some would call the tricks, of the profession. The sleight of plea and demurrer, the legerdemain by which justice is balked and a weak case is made to gain an unfair advantage, was too subtle and shifty for his strong and straightforward intelligence. He met these manœuvres sufficiently well, when

ENGRAVED BY R. G. TIETZE.

JOSHUA R. GIDDINGS.

AFTER A PHOTOGRAPH BY BRADY.

practiced by others, but he never could get in the way of handling them for himself. On the wrong side he was always weak. He knew this himself, and avoided such cases

when he could consistently with the rules of his profession. He would often persuade a fair-minded litigant of the injustice of his case and induce him to give it up. His partner,

DAVID WILMOT. (AFTER A LITHOGRAPH BY M. H. TRAUBEL.)

Mr. Herndon, relates a speech in point* which Lincoln once made to a man who offered him an objectionable case: "Yes, there is no reasonable doubt but that I can gain your case for you. I can set a whole neighborhood at loggerheads; I can distress a widowed mother and her six fatherless children, and thereby get for you six hundred dollars, which rightfully belongs, it appears to me, as much to them as it does to you. I shall not take your case, but I will give a little advice for nothing. You seem a sprightly, energetic man. I would advise you to try your hand at making six hundred dollars in some other way." Sometimes, after he had entered upon a criminal case, the conviction that his client was guilty would affect him with a sort of panic. On one occasion he turned suddenly to his associate and said, "Swett, the man is guilty; you defend him, I can't," and so gave up his share of a large fee. The same thing happened at another time when he was engaged,

* Lamon, p. 317.

† As a specimen of these stories we give the following, well vouched for, as apocrypha generally are: Lincoln met one day on the court-house steps a young lawyer who had lost a case—his only one—and looked very disconsolate. "What has become of your

with Judge S. C. Parks, in defending a man accused of larceny. He said, "If you can say anything for the man, do it, I can't; if I attempt it, the jury will see I think he is guilty, and convict him." Once he was prosecuting a civil suit, in the course of which evidence was introduced showing that his client was attempting a fraud. Lincoln rose and went to his hotel in deep disgust. The judge sent for him; he refused to come. "Tell the judge," he said, "my hands are dirty; I came over to wash them." We are aware that these stories detract something from the character of the lawyer; but this inflexible, inconvenient, and fastidious morality was to be of vast service hereafter to his country and the world.

The Nemesis which waits upon men of extraordinary wit or humor has not neglected Mr. Lincoln, and the young lawyers of Illinois, who never knew him, have an endless store of jokes and pleasantries in his name; some of them as old as Howleglass or Rabelais.† But the fact is that with all his stories and jests, his frank companionable humor, his gift of easy accessibility and welcome, he was, even while he traveled the Eighth Circuit, a

man of grave and serious temper and of an unusual innate dignity and reserve. He had few or no special intimates, and there was a line beyond which no one ever thought of passing. Besides, he was too strong a man in the court-room to be regarded with anything but respect in a community in which legal ability was the only especial mark of distinction. Few of his forensic speeches have been preserved, but his contemporaries all agree as to their singular ability and power. He seemed absolutely at home in a court-room; his great stature did not encumber him there; it seemed like a natural symbol of superiority. His bearing and gesticulation had no awkwardness about them; they were simply striking and original. He assumed at the start a frank and friendly relation with the jury which was extremely effective. He usually began, as the phrase ran, by "giving away his case"; by allowing to the opposite side every possible advantage that they could honestly and justly

case?" Lincoln asked. "Gone to h—," was the gloomy response. "Well, don't give it up," Lincoln rejoined cheerfully; "you can try it again there"—a quip which has been attributed to many wits in many ages, and will doubtless make the reputation of jesters yet to be.

claim. Then he would present his own side of the case, with a clearness, a candor, an adroitness of statement which at once flattered and convinced the jury, and made even the bystanders his partisans. Sometimes he disturbed the court with laughter by his humorous or apt illustrations; sometimes he excited the audience by that florid and exuberant rhetoric which he knew well enough how and when to indulge in; but his more usual and more successful manner was to rely upon a clear, strong, lucid statement, keeping details in proper subordination and bringing forward, in a way which fastened the attention of court and jury alike, the essential point on which he claimed a decision. "Indeed," says one of his colleagues, "his statement often rendered argument unnecessary, and often the court would stop him and say, 'if that is the case, we will hear the other side.'"*

Whatever doubts might be entertained as to whether he was the ablest lawyer on the circuit, there was never any dissent from the opinion that he was the one most cordially and universally liked. If he did not himself enjoy his full share of the happiness of life, he certainly diffused more of it among his fellows than is in the power of most men. His arrival was a little festival in the county-seats where his pursuits led him to pass so much of his time. Several eye-witnesses have described these scenes in terms which would seem exaggerated if they were not so fully confirmed. The bench and bar would gather at the tavern where he was expected, to give him a cordial welcome; says one writer,† "He brought light with him." This is not hard to understand. Whatever his cares, he never inflicted them upon others. He talked singularly well, but never about himself. He was full of wit which never wounded, of humor which mellowed the harshness of that new and raw life of the prairies. He never asked for help, but

was always ready to give it. He received everybody's confidence, and rarely gave his own in return. He took no mean advantages in court or in conversation, and, satisfied with the respect and kindness which he everywhere met, he sought no quarrels and never had to decline them. He did not accumulate wealth; as Judge Davis said, "he seemed never to care for it." He had a good income from his profession, though the fees he received would bring a smile to the well-paid lips of the great attorneys of to-day. The largest fee he ever got was one of five thousand dollars from the Illinois Central Railway, and he had to bring suit to compel them to pay it. He spent what he received in the education of his children, in the care of his family, and in a plain and generous way of living. One‡ who often visited him writes, referring to "the old-fashioned hospitality of Springfield," "Among others I recall with a sad pleasure, the dinners and evening parties given by Mrs. Lincoln. In her modest and simple home, where everything was so orderly and refined, there was always on the part of both host and hostess a cordial and hearty Western welcome which put every guest perfectly at ease. Their table was famed for the excellence of many rare Kentucky dishes, and for the venison, wild turkeys, and other game, then so abundant. Yet it was her genial manner and ever-kind welcome, and Mr. Lincoln's wit and humor, anecdote and unrivaled conversation, which formed the chief attraction."

Here we leave him for a while, in this peaceful and laborious period of his life; engaged in useful and congenial toil; surrounded by the love and respect of the entire community; in the fullness of his years and strength; the struggles of his youth, which were so easy to his active brain and his mighty muscles, all behind him, and the titanic struggles of his manhood yet to come. We shall now try to sketch the beginnings of that tremendous controversy which he was in a few years to take up, to guide and direct to its wonderful and tragical close.

THE STRONG.

DOST deem him weak that owns his strength is tried?
Nay, we may safest lean on him that grieves:
The pine has immemorially sighed,
Th' enduring poplar's are the trembling leaves.

To feel and bow the head is not to fear;
To cheat with jest—that is the coward's art.
Beware the laugh that battles back the tear;
He's false to all that's traitor to his heart.

He of great deeds does grope amid the throng
Like him whose steps toward Dagon's temple bore;
There's ever something sad about the strong—
A look, a moan, like that on ocean's shore.

John Vance Cheney.

CARANCRO.

BY GEORGE W. CABLE,

Author of "Old Creole Days," "The Grandissimes," "Dr. Sevier," etc.

IN TWO PARTS: PART II.

VI. MISSING.

HE war was in its last throes even when 'Thanase enlisted. Weeks and months passed. Then a soldier coming home to Carancro —home-comers were growing plentiful—brought the first news of him. An officer

making up a force of picked men for an expedition to carry important dispatches eastward across the Mississippi and far away into Virginia had chosen 'Thanase. The evening the speaker left for home on his leave of absence 'Thanase was still in camp, but was to start the next morning. It was just after Sunday morning mass that Sosthène and Chaouache, with their families and friends, crowded around this bearer of tidings.

"Had 'Thanase been in any battles?"

"Yes, two or three."

"And had not been wounded?"

"No, although he was the bravest fellow in his company."

Sosthène and Chaouache looked at each other triumphantly, smiled, and swore two simultaneous oaths of admiration. Zoséphine softly pinched her mother, and whispered something. Madame Sosthène addressed the home-comer aloud:

"Did 'Thanase send no other message except that mere 'how-d'ye all do'?"

"No."

Zoséphine leaned upon her mother's shoulder and softly breathed:

"He is lying."

The mother looked around upon her daughter in astonishment. The flash of scorn was just disappearing from the girl's eyes. She gave a little smile and chuckle and murmured, with her glance upon the man:

"He has no leave of absence. He is a deserter."

Then Madame Sosthène saw two things at once: that the guess was a good one, and that Zoséphine had bidden childhood a final "adieu."

The daughter felt Bonaventure's eyes upon her. He was standing only a step or two away. She gave him a quick, tender look that thrilled him from head to foot, then lifted her brows and made a grimace of pretended

weariness. She was growing prettier almost from day to day.

And Bonaventure, he had no playmates — no comrades — no amusements. This one thing, which no one knew but the curé, had taken possession of him. The priest sometimes seemed to himself cruel, so well did it please him to observe the magnitude Bonaventure plainly attributed to the matter. The boy seemed almost physically to bow under the burden of his sense of guilt.

"It is quickening all his faculties," said the curé to himself. Zoséphine had hardly yet learned to read without stammering when Bonaventure was already devouring the few French works of the curé's small bookshelf. Silent on other subjects, on one he would talk till a pink spot glowed on either cheek-bone and his blue eyes shone like a hot noon sky; — casuistry. He would debate the right and wrong of anything — everything, and the rights and wrongs of men in every relation of life.

Blessed was it for him then that the tactful curé was his father and mother in one, and the surgeon and physician of his mind. Thus the struggle brought him light. To the boy's own eyes it seemed to be bringing him only darkness, but the priest saw better.

"That is but his shadow; he is standing in it; it is deepening; that shows the light is increasing." Thus spake the curé to himself as he sat at solitaire under his orange-tree one afternoon.

The boy passed out of sight, and the curé's eyes returned to his game of solitaire; but as he slowly laid one card upon another, now here, now there, he still thought of Bonaventure.

"There will be no peace for him, no sweetness of nature, no green pastures and still waters, within or without, while he seeks life's adjustments through definitions of mere right and rights. No, boy; you will ever be a restless captive pacing round and round those limits of your inclosure. Worse still if you seek those definitions only to justify your overriding another's happiness in pursuit of your own." The boy was not in hearing; this was apostrophe.

"Bonaventure," he said, as the boy came by again; and Bonaventure stopped. The player pushed the cards from him, pile by pile, leaned back, ran his fingers slowly through his thin, gray hair, and smiled.

"Bonaventure, I have a riddle for you. It came to me as I was playing here just now. If everybody could do just as he pleased; if he had, as the governor would say, all his rights, life, liberty, pursuit of happiness—if everybody had this, I say, why would we still be unhappy?"

The boy was silent.

"Well, I did not suppose you would know. Would you like me to tell you? It is because happiness pursued is never overtaken. And can you guess why that is? Well, never mind, my son. But—would you like to do something for me?"

Bonaventure nodded. The curé rose, taking from his bosom as he left his chair a red silk handkerchief and a pocket-worn note-book. He laid the note-book on the table, and drawing back with a smile said:

"Here, sit down in my place and write what I tell you, while I stretch my legs. So; never mind whether you understand or not. I am saying it for myself: it helps *me* to understand it better. Now, as I walk you write. 'Happiness pursued is never overtaken, because'—have you written that?—'because, little as we are, God's image makes us so large that we cannot live within ourselves, nor even for ourselves, and be satisfied.' Have you got that down? Very well—yes—the spelling could be improved, but that is no matter. Now wait a moment; let me walk some more. Now write: 'It is not good for man to be alone, because'—because—let me see; where—ah, yes!—'because rightly self is the'—Ah! no, no, my boy; not a capital S for 'self'—Ah! that's the very point—small s, 'because rightly self is the smallest part of us. Even God found it good not to be alone, but to create'—got that?—'to create objects for his love and benevolence.' Yes—'And because in my poor, small way I am made like Him, the whole world becomes a part of me'—small m, yes, that is right!" From bending a moment over the writer the priest straightened up and took a step backward. The boy lifted his glance to where the sunlight and leaf-shadows were playing on his guardian's face. The curé answered with a warm smile, saying:

"My boy, God is a very practical God—no, you need not write it; just listen a moment. Yes; and so when He gave us natures like His, He gave men not wives only, but brethren and sisters and companions and strangers, in order that benevolence, yes, and even self-sacrifice,—mistakenly so called,—might have no lack of direction and occupation, and then bound the whole human family together by putting every one's happiness into some other one's hands. I see you do not understand: never mind; it will come to

you little by little. It was a long time coming to me. Let us go in to supper."

The good man had little hope of such words taking hold. At school next day there was Zoséphine with her soft electric glances to make the boy forget all; and at the Saturday night balls there she was again.

"Bonaventure," her manner plainly said, "did you ever see anything else in this wide world so tiresome as these boys about here? Stay with me; it keeps them away." She never put such thoughts into words. With an Acadian girl such a thing was impossible. But girls do not need words. She drew as potently, and to all appearances as impassively, as a lodestone. All others than Bonaventure she repelled. If now and then she toyed with a heart it was but to see her image in it once or twice and toss it aside. All got one treatment in the main. Any one of them might gallop by her father's veranda seven times a day, but not once in all the seven would she be seen at the window glancing up at the weather or down at her flowers; nor on the veranda hanging up fresh hanks of yarn, nor at the well with the drinking-pail, getting fresh water, as she might so easily have been, had she so chosen. Yonder was Sosthène hoeing leisurely in the little garden, and possibly the sunbonnet of *la vieille* half seen and half hidden among her lima beans; but for the rest there was only the house, silent at best, or, worse, sending out through its half-open door the long, scornful No-o-o! of the maiden's unseen spinning-wheel. No matter the fame or grace of the rider. All in vain, my lad: pirouette as you will; sit your gallantest; let your hat blow off, and turn back and at full speed lean down from the saddle and snatch it airily from the ground, and turn again and gallop away; all is in vain. For by her estimate either you are living in fear of the conscript officer; or, if you are in the service, and here only transiently on leave of absence, your stay seems long, and it is rumored your leave has expired; or, worse, you cannot read; or, worst, your age, for all your manly airs, is so near Zoséphine's as to give your attentions strong savor of presumption. But let any fortune bring Bonaventure in any guise—sorriest horseman of all, youngest, slenderest, and stranger to all the ways that youth loves—and at once she is visible; nay, more, accessible; and he, welcome. So accessible she, so welcome he, that more than once she has to waft aside her mother's criticisms by pleading Bonaventure's foster-brotherhood and her one or two superior years.

"Poor 'Thanase!" said the youths and maidens.

And now the war came to an end. Bona-

venture was glad. 'Thanase was expected home, but—let him come. If the absent soldier knew what the young folks at the balls knew, he would not make haste in his return. And he did not, as it seemed. Day after day, in group after group, without shouting and without banners, with wounds and scars and tattered garments, some on horses, but many more on foot, the loved ones—the spared ones, remnants of this command and that command and 'Thanase's command—came home. But day by day brought no 'Thanase.

Bonaventure began to wish for him anxiously. He wanted him back so that this load might be lifted. Thus the bitter would pass out of the sweet; the haunting fear of evil tidings from the absent rival would haunt no more. Life would be what it was to other lads, and Zoséphine one day fall to his share by a better title than he could ever make with 'Thanase in exile. Come, 'Thanase, come, come!

More weeks passed. The youth's returned comrades were all back at their plows again and among their herds. 'Thanase would be along by and by, they said; he could not come with them for he had not been paroled with them; he had been missing—taken prisoner, no doubt—in the very last fight. But presently they who had been prisoners were home also; and still 'Thanase had not come. And then, instead of 'Thanase coming, Chaouache died.

A terror took up its home in the heart of Bonaventure. Everything he looked upon, every creature that looked upon him, seemed to offer an unuttered accusation. Least of all could he bear the glance of Zoséphine. He did not have to bear it. She kept at home now closely. She had learned to read, and Sosthène and his *vieille* had pronounced her education completed.

In one direction only could the eyes of Bonaventure go and meet nothing that accused him: that was into the face of the curé. And lest accusation should spring up there, he had omitted his confession for weeks. He was still child enough not to see that the priest was watching him narrowly and tenderly.

One night, away in the small hours, the curé was aroused by the presence of some one in his room.

"Who is that?" He rose from his pillow.

"It is I, father," said a low voice, and against the darkness of an inner door he saw dimly the small, long night-dress of the boy he loved.

"What gets you up, Bonaventure? Come here. What troubles you?"

"I cannot sleep," murmured the lad, noiselessly moving near. The priest stroked the lad's brow.

"Have you not been asleep at all?"

"Yes."

"But you have had bad dreams that woke you?"

"Only one."

"And what was that?"

There was a silence.

"Did you dream about—'Thanase, for example?"

"Yes."

The priest reached out and took the boy's small, slender hands in his. They were moist and cold.

"And did you dream—"

"I dreamed he was dead. I dream it every night."

"But, my child, that does not make it so. Would you like to get into bed here with me? No?—or to go back now to your own bed? No? What, then?"

"I do not want to go back to bed any more. I want to go and find 'Thanase."

"Why, my child, you are not thoroughly awake, are you?"

"Yes, I want to go and find 'Thanase. I have been thinking to-night of all you have told me—of all you said that day in the garden,—and—I want to go and find 'Thanase."

"My boy," said the priest, drawing the lad with gentle force to his bosom, "my little old man, does this mean that you have come to the end of all self-service?—that self is never going to be spelt with a capital S any more? Will it be that way if I let you go?"

"Yes."

"Well, then, my son—God only knows whether I am wise or foolish, but—you may go."

The boy smiled for the first time in weeks, then climbed half upon the bed, buried his face in the priest's bosom, and sobbed as though his heart had broken.

"It has broken," said the curé to himself as he clasped him tightly. "It has broken—thank God."

VII. A NEEDLE IN A HAYSTACK.

IN such and such a battle, in the last charge across a certain cornfield, or in the hurried falling back through a certain wood, with the murderous lead singing and hitting from yonder dark mass descending on the flank, and the air full of imperious calls—"halt!"—"surrender!" a man disappeared. He was not with those who escaped, nor with the dead, when they were buried, nor among the wounded anywhere, nor in any group of prisoners. But long after the war was over, another man, swinging a bush scythe among the overgrown corners of a worm fence, found the poor remnant of him, put it scarcely underground, and that was the end. How many times that happened!

Was it so with 'Thanase? No. For Sosthène's sake the ex-governor had taken much pains to correspond with officials concerning the missing youth, and had secured some slender reassurances. 'Thanase, though captured, had not been taken to prison. Tidings of general surrender had overhauled him on the way to it, near, I think, the city of Baltimore — somewhere in that region, at any rate; and he had been paroled and liberated, and had started, penniless and on foot, south-westward along the railway tracks.

To find him Bonaventure must set out, like him on foot, eastward over some fifty miles of wagon-road to the nearest railway; eastward again over its cross-ties eighty miles to *la ville*, the great New Orleans, there to cross the Mississippi. Then away northward, through the deep, trestled swamps, leagues and leagues across Bayou La Branche and Bayou Desair, and Pass Manchac and North Manchac, and Pontchatoula River two or three times; and out of the swamps and pine barrens into the sweet pine hills, with their great resinous boles rising one hundred — two hundred feet overhead, over meadows and fields and many and many a beautiful clear creek, and ten or more times over the winding Tangipahoa, by narrow clearings, and the old tracks of forgotten hurricanes, and many a wide plantation; until more than two hundred miles from the great city, still northward across the sinking and swelling fields, the low, dark dome of another State's capitol must rise amid spires and trees into the blue, and the green ruins of fortifications be passed, and the iron roads be found branching west, north, and east.

Thence all was one wide sea of improbability. Even before a quarter of that distance should have been covered, how many chances of every sort there were against the success of such a search.

"It is impossible that he should find him," said the ex-governor.

"Well," — the curé shrugged, — "if he finds no one, yet he may succeed in losing himself." But in order that Bonaventure in losing himself should not be lost, the priest gave him pens and paper and took his promise to write back as he went step by step out into the world.

"And learn English, my boy; learn it with all speed; you will find it vastly, no telling how vastly, to your interest — I should say your usefulness. I am sorry I could not teach it to you myself. Here is a little spelling-book and reader for you to commence with. Make haste to know English; in America we should be Americans; would that I could say it to all our Acadian people; but I say it to you; learn English. It may be that by not knowing it you may fail, or by knowing it succeed in

this errand. And every step of your way let your first business be the welfare of others. Hundreds will laugh at you for it; never mind; it will bring you through. Yes, I will tell Sosthène and the others good-bye for you. I will tell them you had a dream that compelled you to go at once. Adieu." And just as the rising sun's first beam smote the curé's brimming eyes, his "little old man" turned his face toward a new life and set forward to enter it.

"Have you seen anywhere, coming back from the war, a young man named 'Thanase Beausoleil?" — This question to every one met, day in, day out, in early morning lights, in noonday heats, under sunset glows, by a light figure in thin, clean clothing, dusty shoes, and with limp straw hat lowered from the head. By and by, as first the land of the Acadians and then the land of the Creoles was left behind, a man every now and then would smile and shake his head to mean he did not understand — for the question was in French. But then, very soon it began to be in English too, and by and by not in French at all.

"Sir, have you seen anywhere, coming back from the war, a young man named 'Thanase Beausoleil?"

But no one had seen him.

Travel was very slow. Not only because it was done afoot. Many a day he had to tarry to earn bread; for he asked no alms. But after a while he passed eastward into a third State, and at length into the mountains of a fourth.

Meantime the weeks were lengthening into months; the year was in its decline. Might not 'Thanase be even then at home? No. Every week Bonaventure wrote back, "Has he come?" and the answer came back, "He is not here."

But one evening, as he paced the cross-ties of a railway that hugged a huge forest-clad mountain side, with the valley a thousand feet below, its stony river shining like a silken fabric in the sunset lights, the great hillsides clad in crimson, green, and gold, and the long, trailing smoke of the last train — a rare, motionless blue gauze — gone to rest in the chill mid-air, he met a man who suddenly descended upon the track in front of him from higher up the mountain, — a great, lank mountaineer. And when Bonaventure asked the apparition the untiring question to which so many hundreds had answered no, the tall man looked down upon the questioner, a bright smile suddenly lighting up the unlovely chin-whiskered face, and asked:

"Makes a fiddle thess talk an' cry?"

"Yes."

"Well, he hain't been gone from hyer two weeks."

It was true. Only a few weeks before, gaunt, foot-sore, and ragged, tramping the cross-ties yonder where the railway comes from the eastward, curving into view out of that deep, green, and gray defile, 'Thanase had come into this valley. So short a time before, because almost on his start homeward illness had halted him by the way and held him long in arrest. But at length he had reached the valley and had lingered here for days; for it happened that a man in bought clothing was there just then, roaming around and hammering pieces off the rocks, who gave 'Thanase the chance to earn a little something from him, with which the hard-marched wanderer might take the train instead of the cross-ties for as far as the pittance would carry him.

VIII.

THE QUEST ENDED.

THE next sunrise saw Bonaventure, with a new energy in his step, journeying back the way he had come. And so anew the weeks wore by. Once more the streams ran southward, and the landscapes opened wide and fertile.

"Sir,—pardon your stopping,—in what State should I find myself at the present?"

The person inquired of looked blank, examined the questioner from head to foot, and replied:

"In what — oh! I understand; yes. What State — Alabama, yes, Alabama. You must excuse me, I didn't understand you at first. Yes, this is Alabama."

"Thank you, sir. Have you seen anywhere, coming back from the war, a young man named 'Thanase Beausoleil?"

"Back from the war! Why, everybody done got back from the war long ago." "Lawng ago-o-o," the speaker pronounced it, but the pronunciation could not be as untrue as the careless assertion.

A second time, and again a third, Bonaventure fell upon the trail. But each time it was colder than before. And yet he was pushing on as fast as he dared. Many a kind man's invitation to tarry and rest was gratefully declined. Once, where two railways parted, one leading south, the other west, he followed the southern for days, and then came back to the point of separation, and by and by found the lost thread again on the more westward road. But the time since 'Thanase had past was the longest yet. Was it certainly 'Thanase? Yes; the fiddle always settled that question. And had he not got home? He had not come. Somewhere in the long stretch between Bonaventure and Carancro there must be strange tidings.

On the first New Year's eve after the war,

as the sun was sinking upon the year's end, Bonaventure turned that last long curve of the New Orleans, Jackson, and Great Northern Railroad, through the rushes, flags, willows, and cypress-stumps of the cleared swamp behind the city of the Creoles, and passing around the poor shed called the depot, paused at the intersection of Calliope and Magnolia streets, waiting the turn of chance.

Trace of the lost 'Thanase had brought him at length to this point. The word of a fellow-tramp, pledged on the honor of his guild, gave assurance that thus far the wanted man had come in strength and hope — but more than a month before.

The necessity of moving on presently carried Bonaventure aimlessly into the city along the banks of the New Canal. The lad had shot up in these few months into the full stature, without the breadth, of manhood. The first soft, uneven curls of a light-brown beard were on his thin cheek and chin. Patient weariness and humble perseverance were in his eyes. His coarse, ill-matched attire was whole and, but for the soiling of foot-travel, clean. Companioning with nature had browned his skin and dried his straight, fine hair. Any reader of faces would have seen the lines of unselfish purpose about his lips, and when they parted nervously for speech, the earnest glow of that purpose in a countenance that neither smiled nor frowned, and though it was shaded, cast no shadow.

The police very soon knew him. They smiled at one another and tapped the forehead with one finger as he turned away with his question answered by a shake of the head. It became their habit. They would jerk a thumb over a shoulder after him facetiously.

"Goes to see every unknown white man found dead or drowned. And yet, you know, he's happy. He's a heap sight"—sometimes they used other adjectives—"a heap sight happier than us, with his trampin' around all day and his French and English books at night, as old Tony says. He bunks with old Tony, you know, what keeps that little grocery in Solidelle street. Tony says his candles comes to more than his bread and meat, or, rather, his rice and crawfish. He's the funniest crazy I ever see. All the crazies I ever see is got some grind for pleasing number one; but this chap is everlastin'ly a-lookin' out for everybody *but* number one. Oh, yes, the candles and books,—I reckon they are for number one,—that's so; but anyhow, that's what I hear Madame Tony allow."

The short, wet winter passed. The search stretched on into the spring. It did not, by far, take up the seeker's whole daily life. Only it was a thread that ran all through it,

a dye that colored it. Many other factors — observations, occupations, experiences — were helping to make up that life, and to make it, with all its pathetic slenderness, far more than it was likely ever to have been made at Carancro. Through hundreds of miles of tramping the lad had seen, in a singularly complete yet inhostile disentanglement from it, the world of men; glimpses of the rich man's world with its strivings, steadier views of the poor man's world with its struggles. The times were strong and rude. Every step of his way had been through a land whose whole civil order had been condemned, shattered, and cast into the mill of revolution for a total remolding. Every day came like the discharge of a great double-shotted gun. It could not but be that, humble as his walk was, and his years so few, his fevered mind should leap into the questions of the hour like a naked boy into the surf. He made mistakes, sometimes in a childish, sometimes in an older way, some against most worthy things. But withal he managed to keep the main direction of truth, after his own young way of thinking and telling it. He had no such power to formulate his large conclusions as you or even I have, but whatever wrought to enlighten the unlettered, whatever cherished manhood's rights alike in lofty and lowly, whatever worked the betterment of the poor, whatever made man not too much and not too little his brother's keeper,—his keeper not by mastery, but by fraternal service,—whatever did these things was to him good religion, good politics. So, at least, the curé told the ex-governor, as from time to time they talked of the absent Bonaventure and of his letters. However, they had to admit one thing: all this did not find 'Thanase.

And why, now, should 'Thanase longer be sought? Was there anything to gain by finding him dead? Not for Bonaventure; he felt, as plainly as though he had seen an angel write the decree, that to Bonaventure Deschamps no kind of profit or advantage under the sun must come by such a way. But was there anything to be gained in finding that 'Thanase still lived? The police will tell you, as they told Bonaventure, that in these days of steam and steel and yoked lightning a man may get lost and be found again; but that when he stays lost, and is neither dead nor mad, it is because he wants to be lost. So where was to be the gain in finding 'Thanase alive? O much, indeed, to Bonaventure! The star of a new hope shot up into his starless sky when that thought came, and in that star trembled that which he had not all these weary months of search dared see even with fancy's eye,—the image of Zoséphine! This

—this! that he had never set out to achieve — this! if he could but stand face to face with evidence that 'Thanase could have reached home and would not.

This thought was making new lines in the young care-struck face, when —

"See here," said a voice one day. Bonaventure's sleeve was caught by the thumb and forefinger of a man to whom, in passing, he had touched his hat. The speaker was a police captain.

"Come with me." They turned and walked, Bonaventure saying not a word. They passed a corner, turned to the right, passed two more, turned to the left,—high brick walls on either side, damp, ill-smelling pavements under foot,—and still strode on in silence. As they turned once more to the right in a dim, narrow way, the captain patted the youth softly on the back, and said:

"Ask me no questions, and I'll tell you no lies."

So Bonaventure asked none. But presently, in one of those dens called sailors' boarding-houses, somewhere down on the water-front near the mint, he was brought face to face with a stranger whose manner seemed to offer the reverse proposition. Of him the youth asked questions and got answers.

'Thanase Beausoleil still lived, far beyond seas. How? why? If this man spake truly, because here in New Orleans, at the last turn in the long, weary journey that was to have brought the young volunteer home, he had asked and got the aid of this informant to ship — before the mast — for foreign parts. But why? Because his ambition and pride, explained the informant, had outgrown Carancro, and his heart had tired of the diminished memory of the little Zoséphine.

Bonaventure hurried away. What storms buffeted one another in his bosom!

Night had fallen upon the great city. Long stretches of street lay now between high walls and now between low-hanging eaves, empty of human feet and rife with solitude. Through long distances he could run and leap and make soft, mild pretense of shouting and smiting hands. The quest was ended! rivalry gone of its own choice, guilt washed from the hands, love returned to her nest! Zoséphine! Zoséphine! Away, now, away to the reward of penance, patience, and loyalty! Unsought, unhopd-for reward! As he ran, the crescent moon ran before him in the sky, and one glowing star, dipping low, beckoned him into the west.

And yet that night a great riot broke out in his heart; and in the morning there was a look on his face as though in that tumult conscience had been drugged, beaten, stoned, and left for dead outside the gate of his soul.

There was something of defiance in his eye, not good to see, as he started down the track of the old Opelousas railroad, with the city and the Mississippi at his back. When he had sent a letter ahead of him, he had no money left to pay for railway passage. Should he delay for that or aught else, he might never start; for already the ghost of conscience was whispering in at the barred windows of his heart.

"It is not true. The man has told you falsely. It is not true."

And so he was tramping once more — toward Carancro. And never before with such determined eagerness. Nothing could turn him about now. Once a train came in sight in front of him just as he had started across a trestle-work; but he ran forward across the open ties and leaped clear of the track on the farther side, just when another instant would have been too late. He stood a moment, only half-pausing among the palmettoes and rushes as the hurtling mass thundered by; then pushed quickly into the whirling dust of the track and hurried on between the clicking rails, not knowing that yonder dark, dwindling speck behind was bearing away from him strange tidings from the curé.

The summer was coming on; the suns were hot. There were leagues on leagues of unbroken, shaking prairie with never a handbreadth of shade, but only the glowing upper blue, with huge dazzling clouds moving, like herds of white elephants pasturing across heavenly fields, too slowly for the eye to note their motion; and below, the far-reaching, tremulous sheen of reed and bulrush, the wet lair of serpent, wild-cat, and alligator. Now and then there was the cool blue of sunny, wind-swept waters winding hither and thither toward the sea, and sometimes miles of deep forest swamp through which the railroad went by broad, frowzy, treeless clearings flanked with impassable oozy ditches; but shade there was none.

Nor was there peace. Always as he strode along, something he could not outgo was at his side, gaunt, wounded, soiled, whispering: "Turn back; turn back and settle with me," and ever put off with promises — after that fashion as old as the world — to do no end of good things if only the one right thing might be left undone.

And so because there were no shade, no peace, and no turning back, no one day's march made him stronger for the next; and at length, when he came to the low thatch of a negro cabin, under the shadow of its bananas he sank down in its doorway, red with fever.

There he had to stay many days; but in the end he was up and on his way again. He left the Atchafalaya behind him. It was easier going now. There was shade. Under his

trudging feet was the wagon-road along the farther levee of the Teche. Above him great live oaks stretched their arms clad in green vestments and gray drapings, the bright sugar-cane fields were on his left, and on his right the beautiful winding bayou. In his face, not joy, only pallid eagerness, desire fixed upon fulfillment, and knowledge that happiness was something else; a young, worn face with hard lines about the mouth and neck; the face of one who had thought self to be dead and buried, and had seen it rise to life again, and fallen captive to it. So he was drawing near to Carancro. Make haste, Bonaventure.

IX.

THE WEDDING.

A HORSE and buggy have this moment been stopped and are standing on a faint rise of ground seven miles out beyond the southwestern outskirt of Carancro. The two male occupants of the vehicle are lifting their heads and looking with well-pleased faces at something out over the plain. You know the curé? — and the ex-governor.

In the far distance, across the vast level, something that looks hardly so large on the plain as an ant on the floor is moving this way across it. This is what the curé and his friend are watching. Open in the curé's hand, as if he had just read it aloud again, is that last letter of Bonaventure's, sent ahead of him from New Orleans and received some days ago. The governor holds the reins.

What do they see? Some traveler afoot? Can it be that Bonaventure is in sight? That is not even the direction from which Bonaventure, when he comes, will appear. No, speck though it is, the object they are looking at is far larger than a man afoot, or any horse, or horse and cakeche. It is a house. It is on wheels, and is drawn by many yoke of oxen. From what the curé is saying we gather that Sosthène has bought this very small dwelling from a neighbor, and is moving it to land of his own. Two great beams have been drawn under the sills at each end, the running gear of two heavy ox-wagons is made to bear up the four ends of these beams, all is lashed firmly into place, the oxen are slowly pulling, the long whips are cracking, the house is answering the gentle traction, and, already several miles away from its first site, it will to-morrow settle down upon new foundations, a homely type of one whose wreath will soon be a-making and who will soon after come to be the little house's mistress.

But what have we done — let time slip backward? A little; not much; for just then, as the ex-governor said, "And where is

Bonaventure by this time?" Bonaventure had been only an hour or two in the negro cabin where fever had dragged him down.

Since then the house had not only settled safely upon its new foundations, but Sosthène, in the good, thorough way that was his own, had carried renovation to a point that made the cottage to all intents and purposes a new house. And the curé had looked upon it again, much nearer by; for before a bride dared enter a house so nearly new, it had been deemed necessary for him to come and, before a temporary altar within the dwelling, to say mass in the time of full moon. But not yet was the house really a dwelling; it, and all Carancro, were waiting for the wedding. Make haste, Bonaventure.

He had left the Teche behind him on the east. And now a day breaks whose sunset finds him beyond the Vermilion River. He cannot go aside to the ex-governor's, over yonder on the right. He is making haste. This day his journey will end. His heart is light; he has thought out the whole matter now; he makes no doubt any longer that the story told him is true. And he knows now just what to do: this very sunset he will reach his goal; he goes to fill 'Thanase's voided place; to lay his own filial service at the feet of the widowed mother; to be a brother in the lost brother's place; and Zoséphine? — why, she shall be her daughter, the same as though 'Thanase, not he, had won her. And thus, too, Zoséphine shall have her own sweet preference — that preference which she had so often whispered to him — for a scholar rather than a soldier. Such is the plan, and Conscience has given her consent.

The sun soars far overhead. It, too, makes haste. But the wasted, flushed, hungry-eyed traveler is putting the miles behind him. He questions none to-day that pass him or whom he overtakes; only bows, wipes his warm brow, and presses on across the prairie. Straight before him, though still far away, a small, white, wooden steeple rises from out a tuft of trees. It is *la chapelle*!

The distance gets less and less. See! the afternoon sunlight strikes the roofs of a few unpainted cottages that have begun to show themselves at right and left of the chapel. And now he sees the green window-shutters of such as are not without them, and their copperas- or indigo-dyed curtains blowing in and out. Nearer; nearer; here is a house, and yonder another, newly built. Carancro is reached.

He enters a turf, cattle-haunted lane between rose-hedges. In a garden on one side, and presently in another over the way, children whom he remembers — but grown like weeds since he saw them last — are at play;

but when they stop and gaze at him it is without a sign of recognition. Now he walks down the village street. How empty it seems; was it really always so? Still, yonder is a man he knows — and yonder a woman — but they disappear without seeing him.

How familiar everything is. There are the two shops abreast of the chapel, Marx's on this side, Lichtenstein's that, their dingy false fronts covered with their same old huge rain-faded words of promise. Yonder, too, behind the blacksmith's shop is the little school-house, dirty, half-ruined, and closed — that is, wide-open and empty — it may be for lack of a teacher, or funds, or even of scholars.

"It shall not be so," said the traveler to himself, "when *she* and I —"

His steps grow slow. Yet here, not twenty paces before him, is the home of the curé. Ah! that is just the trouble. Shall he go here first? May he not push on and out once more upon the prairie and make himself known first of all to *her*? Stopping here first, will not the curé say tarry till to-morrow? His steps grow slower still.

And see, now. One of the Jews in the shop across the street has observed him. Now two stand together and scrutinize him; and now there are three, looking and smiling. Plainly, they recognize him. One starts to come across, but on that instant the quiet of the hamlet is broken by a sound of galloping hoofs.

Bonaventure stands still. How sudden is this change! He is not noticed now; everything is in the highest animation. There are loud calls and outcries; children are shouting and running, and women's heads are thrust out of doors and windows. Horsemen come dashing into the village around through the lanes and up the street. Look! they wheel, they rein up, they throw themselves from the rattling saddles; they leave the big wooden stirrups swinging and the little unkempt ponies shaking themselves, and rush into the *boutique de Monsieur Lichtenstein*, and are talking like mad and decking themselves out on hats and shoulders with ribbons in all colors of the rainbow!

Suddenly they shout, all together, in answer to a shout outside. More horsemen appear. Lichtenstein's store belches all its population.

"*La calèche! La calèche!*" The caleche is coming!

Something, he knows not what, makes Bonaventure tremble.

"Madame," he says in French to a chattering woman who has just run out of her door and is standing near him tying a red Madras kerchief on her head as she prattles to a girl, — "Madame, what wedding is this?"

"*C'est la noce à Zoséphine,*" she replied, without looking at him, and goes straight on

telling her companion how fifty dollars has been paid for the pope's dispensation, because the bridal pair are first cousins.

Bonaventure moves back and leans against a paling fence, pallid and faint. But there is no time to notice him—look, look!

Some women on horseback come trotting into the street. Cheers! cheers! and in a moment louder cheers yet—the caleche with the bride and groom and another with the parents have come!

Throw open the church door!

Horsemen alight, horsewomen descend, down, also, come they that were in the caleche. Look, Bonaventure! They form by twos—forward—in they go. “Hats off, gentlemen! Don't forget the rule!—Now—silence! softly, softly; speak low—or speak not at all; sh-sh! Silence! The pair are kneeling. Hush-sh! Frown down that little buzz about the door! Sh-sh!”

Bonaventure has rushed in with the crowd. He cannot see the kneeling pair; but there is the curé standing over them and performing the holy rite. The priest stops—he has seen Bonaventure! He stammers, and then he goes on. Here beside Bonaventure is a girl so absorbed in the scene that she thinks she is speaking to her brother, when presently she says to the haggard young stranger, letting herself down from her tiptoes and drawing a long breath:

“La sarimonie est fait.”

It is true; the ceremony is ended. She rises on tiptoe again to see the new couple sign the papers.

Slowly! The bridegroom first, his mark. Step back. Now the little bride—steady! Zoséphine, *sa marque*. She turns; see her, everybody; see her! brown and pretty as a doe! They are kissing her!—Hail, Madame 'Thanase!

“Make way, make way!” The man and wife come forth.—Ah! 'Thanase Beausoleil, so tall and strong, so happy and hale, you do not look to-day like the poor decoyed, drugged victim that woke up one morning out in the Gulf of Mexico to find yourself, without fore-intent or knowledge, one of a ship's crew bound for Brazil and thence to the Mediterranean!—“Make way, make way!” They mount the caleches, Sosthène, Madame Sosthène; 'Thanase and Madame 'Thanase. “To horse, ladies and gentlemen!” Never mind now about the youth who has been taken ill in the chapel, and whom the curé has borne almost bodily in his arms to his own house. “Mount! Mount! Move aside for the wedding singers!”—The wedding singers take their places, one on this side the bridal caleche, the other on that, and away it starts, creaking and groaning.

VOL. XXXIII.—71.

“Mais, arrêtez! — Stop, stop! Before going, passez le 'nissette! — pass the anisette!” May the New Orleans compounder be forgiven the iniquitous mixture! *“Boir les dames avant! — Let the ladies drink first!”* Aham! straight from the bottle.

Now, go. The caleche moves. Other caleches bearing parental and grandparental couples follow. And now the young men and maidens gallop after; the cavalcade stretches out like the afternoon shadows, and with shout and song and waving of hats and kerchiefs, away they go! while from window and door and village street follows the wedding cry:

“Adieu, la calège! Adieu, la calège! — God speed the wedding pair!”

Coming at first from the villagers, it is continued at length, faint and far, by the attending cavaliers. As mile by mile they drop aside, singly or in pairs, toward their homes, they rise in their stirrups, and lifting high their ribbon-decked hats, they shout and curvette and curvette and shout until the eye loses them and the ear can barely catch the faint farewell:

“Adieu, la calège! Adieu, les mariées!”

X.

AFTER ALL.

ADIEU; but only till the fall of night shall bring the wedding ball.

One little tune—and every Acadian fiddler in Louisiana knows it—always brings back to Zoséphine the opening scene of that festive and jocund convocation. She sees again the great clean-swept seed-cotton room of a cotton-gin house belonging to a cousin of the ex-governor lighted with many candles stuck into a perfect wealth of black bottles ranged along the beams of the walls. The fiddler's seat is mounted on a table in the corner, the fiddler is in it, each beau has led a maiden into the floor, the sets are made for the contra-dance, the young men stand expectant, their partners wait with downcast eyes and mute lips, as Acadian damsels should, the music strikes up and away they go.

Yes, Zoséphine sees the whole bright scene over again whenever that strain sounds.

It was fine from first to last! The ball closed with the bride's dance. Many a daughter Madame Sosthène had waltzed that farewell measure with, and now Zoséphine was the last. So they danced it, they two, all the crowd looking on: the one so young and lost in self, the other so full of years and lost to self; eddying round and round each other in this last bright embrace before they part, the mother to swing back into still water, the child to enter the current of a new life.

And then came the wedding supper! At one end of the long table the bride and groom sat side by side, and at their left and right the wedding singers stood and sang. How everybody ate, that night! Rice! beef-balls! pass them here! pass them there! help yourself! reach them with a fork! *des riz! des boulettes!* more down this way! pass them over heads! *des riz! des boulettes!* And the anisette! — bad whisky and oil of anise — never mind that; pour, fill, empty, fill again! Don't take too much — and make sure not to take too little! How merrily all went on. How gay was Zoséphine!

"Does she know that Bonaventure, too, has come back?" the young maidens whisper, one to another; for the news was afloat.

"Oh, yes, of course; some one had to let it slip. But if it makes any difference she is only brighter and prettier than before. I tell you — it seems strange, but I believe, now, she never cared for anybody but 'Thanase. When she heard Bonaventure had come back she only let one little flash out of her eyes at the fool who told her, then said it was the best news that could be, and has been as serene as the picture of a saint ever since."

The serenity of the bride might have been less perfect and the one flash of her eyes might have been two, had she known what the curé was that minute saying to the returned wanderer, with the youth's head pressed upon his bosom, in the seclusion of his own chamber:

"It is all for the best, Bonaventure. It is not possible that thou shouldst see it so now, but thou shalt hereafter. It is best this way." And the tears rolled silently down his cheek as the weary head in his bosom murmured back:

"It is best. It is best."

The curé could only press him closer then. It was much more than a year afterward when he for the first time ventured to add:

"I never wanted you to get her, my dear boy; she is not your kind at all — nay, now, let me say it, since I have kept it unsaid so long and patiently. Do you imagine she could ever understand an unselfish life, or even one that tried to be unselfish? She makes an excellent Madame 'Thanase. 'Thanase is a good, vigorous, faithful, gentle animal that knows how to graze and

lie in the shade and get up and graze again. But you — it is not in you to know how poor a Madame Bonaventure she would have been; not now merely, but poorer and poorer as the years go by.

"And so I say, do not go away. I know why you want to go; you want to run away from a haunting thought that some unlikely accident or other may leave Madame 'Thanase a widow and you step into his big shoes. They would not fit. Do not go. That thing is not going to happen; and the way to get rid of the troublesome notion is to stay and see yourself outgrow it — and her."

Bonaventure shook his head mournfully, but staid. From time to time Madame 'Thanase passed before his view in pursuit of her outdoor and indoor cares. But even when he came under her galerie roof he could see that she never doubted she had made the very best choice in all Carancro.

And yet people knew — she knew — that Bonaventure not only enjoyed the acquaintance but sometimes actually went from one place to another on the business of the great ex-governor. Small matters they may have been, but, anyhow, just think!

Sometimes as he so went or came he saw her squatting on a board at the edge of a *coolée*, her petticoat wrapped snugly around her limbs, and a limp sunbonnet hiding her nut-brown face, pounding her washing with a wooden paddle. She was her own housekeeper, chambermaid, cook, washerwoman, gooseherd, seamstress, nurse, and all the rest. Her floors, they said, were always *bien fourbissée* (well scrubbed), her beds were high, soft, snug, and covered with the white mesh of her own crochet needle.

He saw her the oftener because she worked much out on her low veranda. From that place she had a broad outlook upon the world, with 'Thanase in the foreground, at his toil, sometimes at his sport. His cares as a herder, *vacheur*, — *vaché*, he called it, — were wherever his slender-horned herds might roam or his stallions lead their mares in search of the sweetest herbage; and when rains filled the *marais* and the cold nor'westers blew from Texas and the sod was spongy with much water, and he went out for feathered game, the numberless mallards, black ducks, gray ducks, teal — with sometimes the canvas-back — and the *poules-d'eau* — the water-hens and the rails, and the *cache-cache* — the snipe — were as likely to settle or rise just before his own house as elsewhere, and the most devastating shot that hurtled through those feathered multitudes was that sent by her husband — hers — her own — possessive case — belonging to her. She was proud of her property.

Sometimes *la vieille* — for she was *la vieille* from the very day that she counted her wedding presents, mostly chickens, and turned them loose in the dooryard — sometimes she enjoyed the fine excitement of seeing her *vieux* catching and branding his yearling colts. Small but not uncomely they were: tougher, stronger, better, when broken, than the mustang, though, like the mustang, begotten and foaled on the open prairie. Often she saw him catch two for the plow in the morning, turn them loose at noon to find their own food and drink, and catch and work another pair through the afternoon. So what did not give her pride gave her quiet comfort. Sometimes she looked forth with an anxious eye, when a colt was to be broken for the saddle; for as its legs were untied, and it sprang to its feet with 'Thanase in the saddle, and the blindfold was removed from its eyes, the strain on the young wife's nerves was as much as was good, to see the creature's tremendous leaps in air and not tremble for its superb, unmovable rider.

Could scholarship be finer — or as fine — as such horsemanship? And yet, somehow, as time ran on, Zoséphine, like all the rest of Carancro, began to look up with a certain deference, half-conscious, half-unconscious, to the needy young man who was nobody's love or lover and yet, in a gentle, unimpassioned way, everybody's. Landless, penniless, artless Bonaventure, who honestly thought there was no girl in Carancro who was not much too good for him, and of whom there was not one who did not think him much too good for her. He was quite outside of all their gossip. How could they know that with all his learning — for he could read and write in two languages and took the Vermilionville newspaper — and with all his books, almost an entire mantel-shelf full — he was feeling heart hunger the same as any ordinary lad or lass unmated. Zoséphine found her eyes, so to speak, lifting, lifting more and more as from time to time she looked upon the inoffensive Bonaventure. But so her satisfaction in her own husband was all the more emphatic. If she had ever caught a real impulse toward anything that even Carancro would have called culture, she had cast it aside now — as to herself; her children — oh! yes; but that would be by and by.

Even of pastimes and sports she saw almost none. For 'Thanase there was, first of all, his fiddle; then *la chasse*, the chase; the *papegaie*, or, as he called it, *pad-go* — the shooting-match; *la galloche*, pitch-farthing; the cock-fight; the five-arpent pony-race; and too often, also, *chin-chin*, twenty-five-cent poker, and the gossip and glass of the roadside "store." But for Madame 'Thanase there was

only a seat against the wall at the Saturday-night dance, and mass à *la chapelle* once in two or three weeks; these, and infant baptisms. These showed how fast time and life were hurrying along. The wedding seemed but yesterday, and yet here was little Sosthène, and tiny Marguerite, and cooing Zoséphine the younger — how fast history repeats itself!

But one day, one Sunday, it repeated itself in a different way. He was in gay humor that morning. He kissed his wife, tossed his children, played on his fiddle that tune they all liked best, and, while Zoséphine looked after him with young zest in her eye, sprang into the saddle and galloped across the prairie *a la chapelle* to pass a jolly forenoon at *chin-chin* in the village grocery.

Since the war almost every one went armed — not for attack, of course; for defense. 'Thanase was an exception.

"My fists," he said, in the good old drawling Acadian dialect and with his accustomed smile — "my fists will take care of me."

One of the party that made up the game with 'Thanase was the fellow whom you may remember as having brought that first news of 'Thanase from camp to Carancro, and whom Zoséphine had discredited. The young husband had never liked him since.

But, as I say, 'Thanase was in high spirits. His jests came thick and fast, and some were hard and personal, and some were barbed with truth, and one, at length, ended in the word "deserter." The victim grew instantly fierce and red, leaped up, crying "liar," and was knocked backward to the ground by the long-reaching fist of 'Thanase. He rose again and dashed at his assailant. The rest of the company hastily made way to right and left, chairs were overturned, over went the table, the cards were underfoot. Men ran in from outside and from over the way. The two foes clash together, 'Thanase smites again with his fist, and the other grapples. They tug and strain —

"Separate them!" cry two or three of the packed crowd in suppressed earnestness. "Separate them! Bonaventure is coming! And here from the other side the curé too! Oh, get them apart!" But the half-hearted interference is shaken off. 'Thanase sees Bonaventure and the curé enter; mortification smites him; a smothered cry of rage bursts from his lips; he tries to hurl his antagonist from him; and just as the two friends reach out to lay hands upon the wrestling mass, it goes with a great thud to the ground. The crowd recoils and springs back again; then a cry of amazement and horror from all around, the arm of the under man lifted out over the back of the other, a downward flash of steel — another — and another! the long, subsiding wail of a

"GO TELL GOD I WANT MY HUSBAND!"

strong man's sudden despair, the voice of one crying,—

"Zoséphine! Ah! Zoséphine, *ma vieille! ma vieille!*" — one long moan and sigh, and the finest horseman, the sweetest musician, the bravest soldier, yes, and the best husband, in all Carancro was dead.

Poor old Sosthène and his wife! How hard they tried, for days, for weeks, to comfort their widowed child. But in vain. Day and night she put them away in fierce grief and silence, or if she spoke wailed always the one implacable answer,—

"I want my husband!" And to the curé the same words,—

"Go tell God I want my husband!"

But when at last came one who, having come to speak, could only hold her hand in his and silently weep with her, she clung to his with both her own, and looking up into his young, thin face, cried,—not with grace of words, and yet with some grace in all her words' Acadian ruggedness,—

"Bonaventure! Ah! Bonaventure! thou

who knowest the way — teach me, my brother, how to be patient."

And so — though the ex-governor had just offered him a mission in another part of the Acadians' land, a mission, as he thought, far beyond his deserving, though, in fact, so humble that to tell you what it was would force your smile — he staid.

A year went by, and then another. Zoséphine no longer lifted to heaven a mutinous and aggrieved countenance. Bonaventure was often nigh, and his words were a deep comfort. Yet often, too, her spirit flashed impatience through her eyes when in the childish philosophizing of which he was so fond he put forward — though ever so impersonally and counting himself least of all to have attained — the precepts of self-conquest and abnegation. And then, as the flash passed away, with a moisture of the eye repudiated by the pride of the lip, she would slowly shake her head and say:

"It is of no use; I can't do it! I may be too young — I may be too bad, but — I can't learn it!"

At last, one September evening, Bonaventure stood at the edge of Sosthène's galerie, whither Zoséphine had followed out, leaving *le vieux* and *la vieille* in the house. On the morrow Bonaventure was to leave Carancro. And now he said,—

"Zoséphine, I must go."

"Ah, Bonaventure!" she replied, "my children—what will my children do? It is not only that you have taught them to spell and read, though God will be good to you for that! But these two years you have been everything to them—everything. They will be orphaned over again, Bonaventure." Tears shone in her eyes, and she turned away her face with her dropped hands clasped together.

The young man laid his hand upon her drooping brow. She turned again and lifted

her eyes to his. His lips moved silently, but she read upon them the unheard utterance: it was a word of blessing and farewell. Slowly and tenderly she drew down his hand, laid a kiss upon it, and said,—

"*Adieu — adieu,*" and they parted.

As Zoséphine went with erect form and firm, clear tread by her parents and into the inner room where her children lay in their trundle-bed, the old mother said to *le vieux*,—

"You can go ahead and repair the school-house now. Our daughter will want to begin, even to-morrow, to teach the children of the village — *les zonfants à la chapelle.*"

"You think so?" said Sosthène, but not as if he doubted.

"Yes; it is certain now that Zoséphine will always remain the Widow 'Thanase.'"

G. W. Cable.

THE OLDEST CHURCH IN LONDON.

ST. BARTHOLOMEW THE GREAT.

Rahere.

THE oldest ecclesiastical edifice in London is the church of St. Bartholomew the Great. It stands in Smithfield, so closely surrounded by houses that visitors ask where it is when within a few yards of it, and often fail to find it. The church itself is well worth the trouble of finding, and it has a history

worthy of its noble structure.

Smithfield, of which a large paved space still remains open, though included in the jurisdiction of the city was outside the walls of London, and this extramural position is commemorated in the name of the ward, which is to this day called Farringdon Without. The Romans, obeying the law of the twelve tables, which prescribes that dead men shall be neither burnt nor buried within the city, used Smithfield as a cemetery; and both the urns of the period of cremation and the great stone sarcophagi of the later years of Roman dominion have been discovered in digging the foundations of the buildings which stand on the edges of the open space. The last discovery was in 1877, when two Roman sarcophagi were found where the

library of St. Bartholomew's Hospital now stands. They were of Oxfordshire oolite, and must have been brought to London in earlier and more peaceful years than those which immediately preceded the withdrawal of the Roman legions. The skeletons still lodged within them, and the gravel on each side of the sarcophagi remained in its

THE LORD MAYOR'S PEW.

THE GATEWAY.

undisturbed original layers. These citizens of London had rested in Smithfield for fifteen hundred years. In the time of their grandchildren, the warlike tribes which were to found

the greatness of England and of America poured into Britain, and, confident of the present and the future, swept away the past.

The burial-ground of the Romans continued open country outside the walls of London for several centuries. The citizen journeying by the New Gate could say prayers for a safe journey at St. Sepulchre's Church, and he going out by Aldersgate might ask the blessing of the clergy of Great St. Martin's; but between these churches and the highways near which they stood the land was bare. It was called Smethefeld, or Smithfield, and was reputed the king's property. On this open ground in the reign of King Henry I. the original building of St. Bartholomew's Hospital and the existing priory church of St. Bartholomew the Great were built.

Rahere was the founder of both, and he lies in his original tomb under the arches of the magnificent church.

A dilapidated but still beautiful early English gateway near the end of Duke street, Smithfield, leads to the church. The pointed arch is overhung by a red brick house of the seventeenth century, a building modern compared to that on which it encroaches, but interesting when one reflects that from its window the flames of the great fire of London may have been watched dying out in Pie corner, on the other side of Smithfield. The pil-

lars of the archway have disappeared, but parts of their circular capitals remain, and the dog-tooth moldings which adorn the graceful, sharp-pointed arch show that this venerable entrance is as old as the Barons' War. Thomas Fitz Thomas, the mayor of London who lost all for liberty and Simon de Montfort, knew it while its carvings were fresh.

A few steps within this gateway is a dreary church-yard, overlooked on the left by the gables of a row of houses which date from before the fire. The bases of some early English pillars on the right of the church-yard path show that there was once a continuous building from the gateway in Smithfield to the church, and this ruined aisle leads to a doorway in the west end of the church, beside a brick tower of late date. This entrance is dark and unpromising. Striking indeed is the transition, on passing it, from the squalid, modern exterior to the spacious internal grandeur of a Norman church. Of the four styles of Gothic architecture to be seen in England, none is more impressive than the earliest. The grand succession of round arches with huge circular piers produces a solemnity which is the greatest of architectural effects. The style is that of reverence and of faith, and expresses the feelings of

men who had death, the last judgment, the punishment of wickedness, and the reward of the blessed always in their thoughts. The steadfastness of the faith comes at once to the mind: this is the house built upon a rock, which will stand firm against rain and floods and winds.

FONT WHERE HOGARTH WAS BAPTIZED.

THE MILD MAY TOMB.

The present parish church is the choir of the church of the Augustinian priory. The choir screen, as in Norwich Cathedral and other English conventual churches, was placed west of the central tower. It is known that the nave which extended over the existing churchyard was in the early pointed style, so that all that has been destroyed was more modern than what remains, and we see the church much as it was at the time of its founder's death, in 1143. There is no external central tower, but all the internal work for it remains, and is beautifully adorned with zigzagged arches and lozenge-shaped panels of foliage carved in low relief. The north and the south arches of the tower are pointed, while the east and the west are circular, showing that the transition to the pointed style had begun when it was built. East of the tower there are five bays of circular arches with a complex triforium, the capitals of which are beautifully varied, while above there is a clere-story of somewhat later date. The church

is terminated at the east by the remains of a beautiful apse, but this part was seriously injured by a prior who wished to change the Norman into the Perpendicular edifice, as William of Wykeham did Winchester Cathedral. The prior's work was stopped before it had put anything in place of what it had destroyed, and later times have aggravated the defect. The arches and the piers on the ground, the whole triforium, and the vaulting of the aisles are of the best period of the Norman style. The piers are circular, with short, solid-cushioned capitals; the arches of the triforium have zigzag and billet moldings, and each includes four small arches on long pillars, with a broad tympanum above them. The height of the tower arches shows that the original clere-story was as high as the present one, while the absence of vaulting-shafts suggests that there was a painted wooden ceiling as at Peterborough Cathedral. Such are the main features of the church; its details afford material for endless study.

The tomb of Rahere stands in the easternmost bay before the apse on the north side. Over the tomb is some tabernacle work of the fifteenth century, there are four panels of the same date on the base, and the inscription was perhaps recut when these were placed in position, but the effigy is probably original. When the tomb was opened, some twenty years ago, a sandal was found lying with the skeleton. The inscription has all the brevity

he will comfort all her waste places and he will make her wilderness like Eden and her desert like the garden of the Lord. Joy and gladness shall be found therein, thanksgiving and the voice of melody." Smithfield was the wilderness which Rahere had cultivated. There his dust remains undisturbed, and around spring the blossoms of his good actions,—

"Only the actions of the just
Smell sweet and blossom in the dust."

THE APSE.

of an early age: "*Hic jacet Raherus, primus canonicus et primus prior hujus ecclesiæ.*"

The effigy of the first canon and first prior is of wood, and represents him with shaven crown and in the black robe of an Augustinian canon. A crowned angel at his feet holds a shield bearing two lions passant guardant and two crowns. At each side of him is a small kneeling figure of a monk reading from a book. The effigy has well-marked features, and is certainly a portrait of Rahere. His hands are in the attitude of prayer, his features are straight and prominent, and his countenance has the cheerful expression of one who rests in peace. His generous heart would have liked to hear the passage from Isaiah at which the Latin Bibles of the little kneeling monks are open: "For the Lord shall comfort Zion;

He changed Smithfield from waste into useful ground, and the region owes its present features to this ecclesiastic of the reign of Henry Beauclerc.

A life of Rahere was written in the twelfth century, and a manuscript copy of this made at a later date belonged to the priory at the time of its dissolution, and is still preserved. Most of the accounts of him have been drawn from this manuscript. The writer was an Augustinian canon living at St. Bartholomew's, and he had talked with those who remembered Rahere. In his first chapter he says: "This church Raherus founded in honor of the blessed apostle Bartholomew, and there he brought together religious men serving God according to the rule of the most holy Father Augustine, and in the same he ruled in the

THE FOUNDER'S TOMB.

rank of prior and discharged that office for twenty-two years." In a subsequent chapter the biographer mentions that the church was founded in the year from the incarnation of our Saviour one thousand one hundred and twenty-three. Calixtus II., he says, was Pope, and William was Archbishop of Canterbury; while Richard, Bishop of London, consecrated the site, and gave up some rights of ownership which he himself had in it. This passage is important as fixing the exact date of the foundation, as to which some confusion has arisen owing to a blunder which exists in the transcript. The original manuscript said the foundation was in the twenty-third year of the reign of King Henry. The transcriber copying the Latin wrote an x too much, thus changing "XX et III," twenty-third, into "XXX et III," thirty-third, and then, to try and

square matters, made the *thirty years* apply to the king's age and the *third year* to his reign. Hence the statement of many books on London that the church was founded A. D. 1103. An examination of the account as a whole shows that the original writer referred to a time later than 1103, and that the earliest year he could have meant was 1123. Richard was not Bishop of London till 1108, and he died in 1127, and, what is conclusive, William was not consecrated Archbishop of Canterbury till February 18, 1123. Henry I. was, moreover, thirty years of age in the first year of his reign. The Augustinian canon's life of Rahere does not give many more dates. His object was to write the spiritual history of the founder, and not to chronicle the early history of his foundation. He tells how in his youth Rahere used to frequent the houses of nobles and the

king's court and cared chiefly to praise and divert his associates. But a change came over him, and he determined to spend his days better. His first step was a pilgrimage to Rome, where he visited the places of martyrdom of the apostles Peter and Paul. The latter place has always been notorious for its malaria. Rahere fell ill and vowed, if he recovered, to found a hospital for the poor in his own country. He did recover, and on his journey home had a vision in which a winged beast seemed to carry him aloft and to place him on a crag. In terror he called out, when, behold, a form of royal mien and wondrous beauty appeared to him. "I," said the form, "am Bartholomew, the apostle of Jesus Christ, and I have come to help thee in thy need and to instruct thee in hidden things of heavenly mystery. Know, then, by the will of the Trinity on high, and the universal will and command of the heavenly kingdom, that thou shalt choose a place in the outskirt of London, at Smedhfeld, where in my name thou shalt found a church, and it shall there be a house of God, a tabernacle of the Lamb, a temple of the Holy Ghost. Almighty God will dwell in this spiritual house, he will sanctify it, glorify it, and keep it spotless forever, and his eyes shall be open and his ears intent upon that house day and night, so that he who asks thence shall receive, he who seeks thence shall find, and he who knocketh thence shall he let in. They who pray there with contrite hearts shall be heard in heaven, and angels shall open the gates of heaven to vows and prayers coming thence. Therefore lift up thy hands, and, having faith in the Lord, work like a man. Be not troubled as to the means. Thou art to be the servant in this work; I will discharge the office of lord and patron." Thereupon the vision disappeared. Rahere mused upon it as he traveled on. Was it a fantastic illusion such as men often have in their sleep, or was it a message from heaven? How could he be worthy of such a communication, and yet, having received it, how dreadful to neglect it. Humility and fear, says his biographer, strove in his heart. God's will, he reflected, has often been made known to men in dreams, as may be read in both the Old and the New Testament. Daniel learnt the king's dream from his own and recognized God's revelation. Joseph was

A PRIVATE PEW.

not afraid to accept as true the exhortation of a dream. Rahere made up his mind that his was a true vision, and decided to fulfill its command as well as his former vow. On his return, his friend Richard, Bishop of London, spoke for him to the king, and he set to work on both foundations. He accomplished both, and the canon tells of several of his further good deeds during his life, and how he died on September 20, 1143, and what wonders were wrought at his tomb after his death. The canon's account of Rahere's life is confirmed in many important particulars by independent evidence. This has never been fully set forth, and the statements of the canon with regard to Rahere's fondness for gossip and jocularities before his pilgrimage have led to a groundless but often-repeated statement that he was the king's jester. The assertion is as unjustifiable as the archbishop's mistake about Mr. Yorick.

It can be shown that Rahere filled the stall of Chamberlayne's Wood in St. Paul's Cathedral about 1116, and an old French charter

proves that he was a Frenchman, and makes it probable that he came, like his friend and patron Bishop Richard, from the Duchy of Maine. It is further probable that he made his pilgrimage about 1120, at the time when the king and his friends were lamenting the untimely death of Prince Henry in the white ship. At the Three Fountains Rahere got Roman fever. It is very likely that he may have been tended during his illness on the Island of St. Bartholomew, where the old temple of Æsculapius, turned into a Gothic church, had recently been made celebrated by its reception of a famous relic stated to be the body of St. Bartholomew the apostle. The hospital now upon the island is of later date than the twelfth century, but it is probable that it had an earlier representative, and there Rahere may actually have been treated as well as the times allowed. Quinine was unknown, and Al Rhazis, whose treatise was the medical text-book of the day, knew no real cure for malarial fever. A homeward journey, with a mind bent on accomplishing a great

work, was the best treatment to be had for intermittent fever in the twelfth century. The vision and its results—were they merely part of the fever? Rahere was himself in doubt, but his grateful heart decided that they had a deeper meaning, and we may rest content to judge them by their abundant good fruits. The ancient seal of the priory, on which is engraved a church standing on a ship, with the words, "*Navis celi*," while of course pointing to the ship of the church, may have been adopted in allusion to the form of the island of St. Bartholomew in Rome, the travertine cliff of which is carved into the shape of a Roman galley.

Rahere came back from Rome in the habit of a canon regular of St. Austin. He had some companions who chose him for their head, and he built his hospital and his church, and ten years later obtained a charter of privileges from the king. The original has disappeared, but the enrolled copy was preserved in the Tower of London, and is now in the public record office. It is clear that the prior

REAR ENTRANCE.

and his foundation enjoyed the royal favor, for the king says: "I will maintain and defend this church even as my crown," and "I adjure all my heirs and successors in the name of the Holy Trinity that they maintain and defend this sacred place by royal authority, and that they grant and confirm the liberties by me granted to it." A still more interesting document of Rahere's time has been preserved. It is of the year 1137, and was executed by Rahere himself. It has been kept in St. Bartholomew's Hospital ever since Rahere's time, and was first noticed in modern times by Dr. Powell, physician to the hospital, who published an excellent account of it, with its text, about sixty years ago. This charter of Rahere's is a small piece of parchment, written in a beautifully clear hand, and two large seals in good preservation remain attached. Its words are so few and so much to the point that it is worth translating at length.

"Be it known to all the faithful that I, Raherus of St. Bartholomew's which is in Smethefield Prior, and the whole convent of our church have granted as a benefice the church of St. Sepulchre to Hagno the clerk so long as he shall not enter the rule of another order to the end of his days. Moreover, know ye that the aforesaid Hagno shall every year render to the use of the canons and of the poor in the hospital fifty shillings; at the feast of Saint Michael twenty-five shillings, and at Easter twenty-five shillings. In the year of the Lord's incarnation eleven hundred and thirty-seven, the second year moreover of the reign of King Stephen in England. These were the witnesses: Haco, the dean; Hugh, canon of St. Martin's; Walter, brother of William the archdeacon; Tybold, the canon; Ralph, the master; Gilbert, the priest; Osbert, the priest; Robert, of St. Mary's; Algar, the priest; Godfrey, son of Baldwin the treasurer; Roger Black; Alexander; Odo; Geoffrey Conestable; Richard, the priest; Burdo, the clerk; Geoffrey, of Oheli."

The witnesses were churchmen, Rahere's neighbors and friends. The first is Haco, Dean of St. Martin's, a canon of which is the second witness. St. Martin's is as well known now as in the days of Rahere. He knew it as a collegiate church, the quiet home of a college of learned priests, founded before the conquest, respected and augmented by the Conqueror. In our day it is the General Post-office, the busiest center of the farthest extended business in the world. William, whose brother Walter is the next witness, is the first

TABLETS TO BENEFACTORS.

archdeacon of London whose name has been preserved. The list contains several members of the chapter of the great cathedral which is, in this day as in that, the central ornament of London. Godfrey, son of Baldwin, is the first-recorded treasurer of St. Paul's. Osbert was a royal chaplain who held the prebendal stall of Consumpta-per-mare. Geoffrey Conestable was one of Rahere's successors in the stall of Chamberlayne's Wood, the sixth upon the south side of the choir. From the masses of documents preserved in the city of London, it is possible to learn where most of these witnesses lived, and an ancient deed shows that Algar, the priest, had his house in the line of the present Thames street. Hagno, to whom the grant of St. Sepulchre's Church is made in this deed, succeeded Rahere, first as master of St. Bartholomew's Hospital, and afterwards as head of the priory. "He was a cheerful man," says a chronicler, "who could make verses off-hand while preaching, and to hear whose sermons crowds did flock."

Two seals are attached to the deed, one

round, the other oval. The round one is that of the priory, the other one, that of Rahere, at once prior of St. Bartholomew's and master of the hospital. On the seal of the priory is engraved the church as built by its founder. There are three towers—a solid one resting on the west end of the roof, a bell turret on the east end, and a great tower standing free of the church and surmounted by a cross. A chapel projects at the east end, of which traces may still be noticed behind the apse of the church, while more will certainly be found when the fringe-factory which at present occupies the site of this chapel is restored to ecclesiastical uses. The Latin legend on the seal reads, "The seal of the convent of the church of God and of St. Bartholomew of Smethefelde." The other seal bears the figure

of a canon of St. Austin with his hood over his head. On the margin most of the letters of Rahere's name are still distinct. Its back is plain, but on the reverse of another very early seal of a master of the hospital is a smaller impression bearing the words, "Sigill. hospital. S. Barthol.," surrounding the figure of an eagle, with curved beak, spread tail, partly expanded wings, and finely engraved feathers. The convent seal and that of Rahere are examples of English art of the beginning of the twelfth century, but this eagle is a piece of ancient Roman work, and the outline of the gem from which it was impressed may be traced within the inscribed border. It was cut by some Roman artist not long after the time of the Cæsars, and was at least eight hundred years old when it was fixed in the seal of the

CLOTH FAIR.

IN THE CHURCH-YARD.

hospital. Perhaps Rahere himself had brought it from Rome; at any rate it was religiously preserved in the hospital for four centuries; for while the seal which Rahere used is replaced in deeds of the end of the twelfth century and the beginning of the thirteenth by one bearing a noble standing figure of St. Bartholomew, staff in hand, and that in the fourteenth century by a more conventional figure of the saint holding a flaying-knife and with armorial bearings on each side, on the reverse of all is the impression of this ancient classical gem.

It was the last prior but one who spoiled the apse. He, too, cut the corbels of the western tower arch into perpendicular moldings, destroying the bolder and more appropriate Norman corbel table which matched that fortunately preserved in the eastern arch.

"Prior Bolton with his bolt in tun," as Ben Jonson calls him, has, however, left one picturesque bit—a little bow-window which projects from the triforium into the church, and has his rebus, a cross-bow bolt piercing a wine-tun, carved on its middle panel. In the buildings surrounding the church, and which it is hoped may soon be removed, fragments will probably be found of the work of priors intermediate between Rahere and Bolton. As it is, there are only two; one is a lovely triple

Purbeck marble shaft and fragment of vault of the decorated period, in the south aisle, and the other is the early English doorway in Smithfield.

There are many fine tombs of the period succeeding the dissolution of the priory, and the handsomest of all is that of Sir Walter Mildmay, Chancellor of the Exchequer to Queen Elizabeth and founder of Emmanuel College, Cambridge, where Harvard was educated. This tomb is a fine piece of renaissance work in colored marble. Its decorations are columns, borders, and panels, with armorial bearings, and the absence of figures of any kind reminds us of Mildmay's rigid Puritanism. A great many Puritans seem to have lived in the parish in the seventeenth century, and a manuscript book preserved in the vestry, recording the preachers and the collections made in the church after sermons, and on other occasions, shows that they gave often towards the support of their friends during the great rebellion. Between February, 1642, and March, 1645, there were thirty-one collections for sick and maimed soldiers; a collection "for those souldiers that ware listed to goe for Irland"; a collection to raise a troop of horse for service in Ireland; besides £1. 12s. 4d. for Sir Thomas Fairfax, and a great many collections for those injured or impoverished by the

rising in Ireland. The parishioners often gave for the relief of distant towns and countries, and curious fragments of the life of that time come out in these terse, business-like entries. To be carried into slavery by the corsairs of Algiers or of Tunis was not uncommon then, and we read :

"Collected this 20 of Aprill, 1645, for Bridget Tookey, which was taken by the Turkes, the sum £1.3.2.",
and

"Collected this 14 of February, 1646, for Henry Smart, being a captive in Tunnis. The monies collected was to be paid to Joyce Smart, his sister, the sum of £1.2.6."

Nor were the friends of the Puritans across the ocean forgotten, for there was

"Collected for the children of New England uppon 2 Sabath daies following in february, 1643—£2.8.9."

The priory at the dissolution was sold to Sir Richard Rich on condition that he should preserve the choir as a parish church. He made what he could of the materials and of the land, but the signs of its old use are still well marked in the parish of St. Bartholomew the Great. Iron gates at the entrances of Cloth Fair and of Bartholomew Close are

still shut at midnight, and recall the days when the building and grounds of the priory covered the whole parish. The close is still an open space. The last tree of the mulberry garden was cut down in the present century. Many narrow, tortuous, paved paths mark lines originally laid down by the canons regular of St. Austin. Among the buildings which abut on the church, one of which has till lately been a fringe-factory, while another is still a forge, may be traced remains of the library, the refectory, the chapter-house, the lady chapel, and the cloister. The present rector and church-wardens, aided by the liberality of the patron of the living, of the inhabitants of the parish, and of many of the citizens, have already bought part of these buildings, and hope soon to buy them all. It will then be possible to preserve this venerable church and what remains of its ancient ecclesiastical surroundings from further dilapidation, so that many generations yet to come may be affected and delighted by its venerable architecture, and taught at once the beauty and the permanence of good deeds as they visit the tomb and admire the work of its generous builder and founder.

Norman Moore.

WOULD WE RETURN?

WOULD we return
If once the gates which close upon the
past
Were opened wide for us and if the dear
Remembered pathway stretched before us clear
To lead us back to youth's lost land at last,
Whereon life's April shadows lightly cast
Recalled the old sweet days of childish fear
With all their faded hopes and brought anear
The far-off streams in which our skies were
glassed ;
Did these lost dreams which wake the soul's
sad yearning
But live once more and waited our returning,
Would we return ?

Would we return
If love's enchantment held the heart no more
And we had come to count the wild sweet pain,
The fond distress, the lavish tears—but vain;
Had cooled the heart's hot wounds amidst
the roar
Of mountain gales, or, on some alien shore
Worn out the soul's long anguish and had slain
At last the dragon of despair—if then the train
Of vanished years came back, and, as of yore,

The same voice called, and with soft eyes be-
guiling,
Our lost love beckoned, through time's gray
veil smiling,
Would we return ?
Would we return
Once we had crossed to death's unlovely
land
And trod the bloomless ways among the
dead
Lone and unhappy ; after years had fled
With twilight wings along that glimmering
strand,
If then—an angel came with outstretched
hand
To lead us back, and we recalled in dread
How soon the tears that once for us are
shed
May flow for others—how like words in
sand
Our memory fades away—how oft our waking
Might vex the living with the dead heart's
breaking,
Would we return,—
Would we return ?

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null,"
"The Casting Away of Mrs. Lecks and Mrs. Aleshine," etc.

IX.

HEN Mr. Enoch Bullripple found himself with the Vatoldi establishment upon his hands, with John People steaming southward down

the coast, and an unknown proprietor far away in some hazy distance, he rubbed those horny hands with much satisfaction. He had never managed a restaurant, and under ordinary circumstances, he would not have considered himself competent to undertake such responsibility; but this was a peculiar case, and Enoch believed himself fully able to treat it in the peculiar fashion which he had in view. He was a shrewd, quick-witted man, and in the course of his varied life had adapted himself to a great many out-of-the-way circumstances.

He had but a single object in this scheme of getting control of Vatoldi's, and that was to discover the owner, the man behind the scenes. That this owner was determined not to come forward into public view was plain enough, for if anything would have brought him forward, it would have been the recent disturbance of his business. That for some reason John was determined not to reveal the identity of this person was equally plain.

That John himself was at the head of affairs was a supposition well enough suited to the public mind, but Mr. Bullripple's mind would not entertain it for a moment. In the first place, he knew that his nephew had not the capital nor the interest to control such a business, and that he did not enjoy the income nor the independence which it would have given him; and, more than this, he did not believe that John had the ability to plan and carry on the admirable organization which had given Vatoldi's its reputation and its success. That John had abilities of a high order, his uncle did not doubt, but these, in Enoch's belief, were the abilities to do well what he was told to do. If he could find out the man who told his nephew what he was to do, and who rewarded him so indifferently for doing it, he did not doubt but

he could make a very considerable revolution in the state of affairs, and one which would result to John's advantage. He had his nephew's welfare very much at heart, and he did not share his sister's opinion that the young man should return to them and become a farmer. From his own experience and observation he believed that there was more money in restaurant-keeping than in farming.

When Mrs. People heard that her son had gone off on a sea trip, she was glad of it, of course, because she believed he needed such a trip, but she was very much disturbed that he had not taken leave of her. Of the means employed to send John away Enoch told her nothing. She was not a person who could prevent the outside world from sharing in any information which she possessed, and besides, she would have been very much troubled, and might have, therefore, very much interfered with her brother's plans had she known that John had gone off against his will.

"You see, Hannah," said Mr. Bullripple, when he communicated the fact of John's departure, "there wasn't no time for good-byes. The steamer started off sooner than he expected, and it was lucky I had packed his valise for him and sent it down. But now he's off all right, with the best kind of weather, and he'll be back in about a week, well set up with good sea air. And what's more, if he's got his wits about him, he ought to do a little profitable tradin' down there, if it's nothin' but early peaches."

"Does Mr. Vatoldi know he has gone?" asked Mrs. People.

"No, he don't," said Enoch. "And if he wants to know anythin' about it, let him come and ask me; that's all he's got to do. And now, Hannah," continued Mr. Bullripple, "as long as you and me has got charge here, there's goin' to be a change in this restaurant. Things is goin' to be twisted around, and made very different from what they was before."

"What's the good of twistin' 'em?" asked Mrs. People. "I'm sure John's ways was all very good ways."

"That's all jus' so," replied her brother, "when the business was on its legs. But now it's flat on its back we've got to put a pillow under

* Copyright, 1886, by Frank R. Stockton. All rights reserved.

its head, and do a lot of things to make it comfortable. I don't suppose there'll be more customers than you and me can manage to do for, and if we jus' keep ourselves bold and chipper, and let people see that we're afraid of nobody, and that we're goin' to do what we please without carin' what anybody thinks about it, it won't be long before them old waiters will git tired howlin' for their coat-tails, and they'll all be beggin' to be took back. And when John comes home we can jus' hand over the place to him, and let him run it along as he used to."

"But I should think Mr. Vatoldi would have somethin' to say to all this," said Mrs. People.

"Very good," replied her brother; "and all he's got to do is to come and say it."

Vatoldi's was closed early that evening, and Mr. Bullripple went to work to inaugurate the new system by which the establishment was to be conducted. By the end of the following day the place was in pretty good running order. All the recently engaged waiters, many of whom showed signs of faint-heartedness and might be at any time frightened away by the boycotters, were discharged, and their places were supplied by a body of men whose training had been received at what is known as the cheap American restaurant.

If there remained extant anything of the spirit which used to animate the volunteer firemen of our city, the "Jakeys" and the "Sykeses" who "ran with the machine," and considered that banging each other over the head with their brass horns was one of the necessary accompaniments of a conflagration, it remained in these men. With a bold, undaunted air they strolled up and down the rows of tables with the peculiar intrepidity of shuffle known only to waiters of this class. In strong untrammelled tones they rang out the orders of the customers, sounding startling changes brought about by continued repetition upon the names of standard dishes and viands, and tossing to each diner his pasteboard check with an accuracy of aim which was sure to deposit it upon some retentive article of food.

These men had never worn dress-coats, and the army and navy would have to march over their dead bodies before they could be made to wear them. If a strike were on foot in which they sympathized, not a fallen spoon would they pick up from the floor until the matter in dispute had been settled; but in a strike like this at Vatoldi's they could see no sense, and if a boycotter had attempted to tamper with one of them, he might have imagined that the volunteer fire department had been revived, and that he and the waiter ran with rival companies.

The class of restaurant to which these men belonged was a very familiar one to Mr. Bull-

ripple. When he was in business in the city he took his meals in such places, and many of their prominent features were fixed in his memory. In its palmy days, when everything was flowing smoothly at Vatoldi's, Enoch would never have advised his nephew to adopt any of these familiar features; but now there had been a great change in the conditions of the place, and the old man seemed to think it necessary to act in harmony with this fact; and he therefore set about making everything as different as possible from what it used to be. Placards were hung on the walls on which prominent articles of the ordinary bill of fare were inscribed in large letters of black and red.

Mrs. People was very proud of her ability in the manufacture of various kinds of pie, and as soon as she found she could do what she pleased in the kitchen, she went to work with radiant delight to make and bake pies. Many of the largest placards were emblazoned with the legend, "Home-made Pies," followed by an enumeration of varieties, and the price per slice. A table near the door was covered with cans, jars, and bottles, selected from the store-room on account of the brightness of their labels; and on an adjoining table—there were plenty of them to spare just now—were specimens of cheese, pastry, fruit, cakes, etc., all covered with gauze netting to keep off the flies. In the two large show windows, which had never before contained anything but some luxuriant and handsome specimens of tropical plants in æsthetically decorated jars, now appeared some of the aforementioned placards, together with plates of uncooked chops or steaks, a box of live crabs packed in seaweed, a few particularly resplendent tin cans, with other objects of the sort adapted to catch the eye of the passer-by.

When the boycotters discovered John's absence, and noticed the great alteration in the aspect of Vatoldi's, they naturally supposed that the place had changed hands, and that in this way their oppressors had eluded the punishment which was being dealt out to them. But a few inquiries made to Mr. Bullripple by an emissary soon dispelled this notion, and they found that Mr. People was only temporarily absent, and that the establishment had not been sold, and that they could expect no favors from the parties in charge. They therefore continued their annoyances, and endeavored, by every method with which they did not expect police interference, to create a public feeling in favor of themselves, and against the heel-grinding practiced in the den called Vatoldi's.

When Mr. Bullripple and Mrs. People first appeared at Vatoldi's, that constant customer,

J. Weatherby Stull, met them as he would have met any man or woman whom, years ago, he had been in the habit of occasionally meeting in the neighborhood of Cherry Bridge, where he then lived. He spoke to them with a good-natured condescension, into which he infused enough cold dignity to show them the immense distance between their station and his own. He asked a few questions in regard to crops, etc., and then ordered his meal, and took out his newspaper. When he first discovered John's absence from his accustomed post, he was surprised and uneasy; and although he was careful not to show any interest in the matter, he could not avoid asking Mr. Bullripple what had become of his nephew, adding that he was so accustomed to seeing him there that the place appeared odd without him.

Enoch replied that John had gone away to make arrangements for regular supplies from the South, and that he would not be back for several days, perhaps a week.

"But that won't hender this place from goin' all right," added Mr. Bullripple. "John's mother and me will run the place, and you can always git your breakfast, dinner, and supper here, Mr. Stull, with somethin' to eat between meals, if you want it."

There was not a more astounded person in the city of New York than the proprietor of Vatoldi's when he received this information. A hundred questions rushed towards his tongue, but he could ask none of them. His long-continued habit of guarded non-interest when performing his part of a regular patron of the establishment had made him very prudent, and he could not help feeling that more than ordinary caution would be required in dealing with a sharp-witted old man like Enoch Bullripple. So he contented himself with some simple remark, paid his bill, and went away.

But his way was not a quiet one. His mind was troubled and tossed by conjectures regarding John's amazing stupidity at leaving his post, and, without consultation with himself, putting Vatoldi's in charge of those two country clodhoppers. To be sure, John had spoken to him about supplies from the South, but nothing had been said which could possibly lead him to suppose that that young man would actually leave the city for several days, or perhaps a week. Such idiocy, such criminal insubordination, he had never heard of! He could not understand it, and no supposition in regard to the matter which he brought before his reasoning powers was able to satisfy them.

But this state of mind was oil-smoothed tranquillity compared to the typhoon of emo-

tions which swept through him when he perceived the changes which Mr. Bullripple had wrought in Vatoldi's—that ideal restaurant, which was at once his pride, his profit, and his closet skeleton. When he saw the firemen-like waiters striding up and down among his tables; when he saw the black-and-red-lettered placards, bearing the words, "Clam Chowder," "Golden Buck," "A Fry in a Box," "A Stew in a Pail"; but particularly when he saw the sign, "Home-made Pies, Five Cents a Slice," did the blood of Mr. Stull run in his veins like trickling streams from a glacier. He was so much astonished by the aspect of the place that he forgot to sit down, and stood almost motionless at the end of a table, until one of the new waiters strode up to him, and in a correspondingly strident voice inquired, "Have ye give ye'r order?"

For a few minutes Mr. Stull felt as if his whole nature demanded that he should rise up and assert himself; that then and there he should announce that he, J. Weatherby Stull, was lord and king of this establishment, and thereupon drive out the rowdy waiters, pack off to their homes the execrable Bullripple and his sister, tear down those vile placards, and, if necessary, shut up the place until the time should come when it could be restored to its former high position.

But he did not rise and speak. Even this soul-harrowing desecration could not give enough courage to this bank president, to this owner of the highest-priced pew, to this dignified condescender in society to avow to the world that, besides all this, he was a restaurant-keeper, and that it was the income from the sale of beefsteaks and mutton chops, tea, coffee, and ice-cream that had enabled him to establish the bank, to hire the pew, and to reach that high position in society from which he was accustomed to condescend. No, he could not do it. For too many years had he kept this vulgar source of wealth concealed from the public eye to allow it now to appear and stain with its gravies and its soups that unblemished eminence on which he believed himself to stand.

There was nothing for him to do but to sit dumb and see all this ruinous profanation of Vatoldi's without lifting a finger to prevent it. But if ever the time came when he could grind into dust the heart and fortunes of that rascally old farmer and his nephew, to whose treachery the present state of affairs was due, Mr. Stull swore to himself that with a firm and rapid hand he would grind.

He could not eat the meal he had ordered, and when he had sat over it long enough, he went up to the desk behind which Mr. Bullripple stood. As a well-known and regular

customer, Mr. Stull thought he might speak without exciting suspicion.

"You have made great changes here, Mr. Bullripple," he said. "I have been a patron of this establishment for some years, and I have never seen anything like this before. I am not accustomed to being waited upon by men of this class, and I do not like to sit in a room surrounded by such placards as I see upon these walls. The place has fallen very much from its former condition, which was highly creditable to its managers and its proprietors. Was it your nephew who decided to make these changes?"

"Now look here, Mr. Stull," said Enoch, leaning forward on the desk, and speaking in a conciliatory tone of voice, "John hasn't got nothin' to do with all this. John's away on business, and till he comes back, I'll have to run the consarn. I've got head enough on my shoulders, Mr. Stull, to know that a place that's bein' boycotted can't be run like a place that everybody's got good words and good money for. Now till John gits home I'm goin' to let them strikin' waiters see that neither them nor their coat-tails is needed here. And let me give you a piece of advice, Mr. Stull. It's easy enough to see that the kind of restaurant I'm goin' to run isn't suited to you and your likin's, and, if I was you, I'd keep away for a time. There's other restaurants that would suit you better, and if things ever gits round to the way they used to be, you might come back ag'in."

It was difficult for Mr. Stull to control his voice and his manner, but he did it. "I am not accustomed," he said in a tone as cold and disinterested as he could command, "to change the place where I take my meals. I have been coming here for a long time, and I shall continue to do so. By the way," — and here Mr. Stull determined to make a somewhat hazardous stroke, — "do the proprietors of this establishment approve of these changes?"

Mr. Bullripple leaned farther over the desk, and his tone became very confidential. "John never told me what sort of man Vatoldi is, and I've never asked him anythin' about him. But it's my opinion, Mr. Stull, that he is a mean, sneakin' hound who gits as much as he can out of other people, and gives 'em jus' as little as he can make 'em take, and when any trouble comes up he puts his tail between his hind legs and sneaks off like a dog that's been whipped fur stealin' victuals off the kitchen table, and keeps out of sight and hearin' till everythin' is all right ag'in, leavin' other people to stand up and be boycotted and abused. Now, if that coward of a proprietor, with a ham sandwich for a soul, and a stale one at that, don't like the way things are being managed here, let him come out of his hole and say so to me. That's

all I want. Let him come and tell *me* what he thinks about it!" And, with that, the old man brought his hand heavily down on the desk.

Mr. Stull was a strong man, especially in those mental faculties whose duty it was to guard his long-preserved secret, but his strength was scarcely equal to this occasion. If he had spoken a word he would have exploded like a dynamite bomb. All that he did was to turn away suddenly with a "Humph!" as if he had been wasting his valuable time in listening to this talk about matters in which he took no interest. He then stalked off, the condescension with which he stepped out of the way of an incoming customer being mingled with a ferocity, which, had it been observed, must have been considered a singular combination.

Furious as was the mind of Mr. Stull, raging as it did by day and by night against the cruel fate which obliged him to bear these insults, these wrongs, and these treacheries without opening his mouth or moving his hand in his own defense, his mental turmoil did not prevent his regular attendance at Vatoldi's. He might, he thought, have staid away without exciting remark, for his absence would naturally be attributed to his disgust at the present state of affairs. But he could not stay away. He must go there, he must see what that black-hearted scoundrel of a farmer was doing with his property. Since the departure of John People no money had been paid in at the bank, the manager having probably neglected to inform his uncle of that part of the daily duties of the establishment. But Mr. Stull was not disturbed on this account. Monstrous as he considered Enoch Bullripple's conduct to be, he knew that the old man was perfectly honest, and he felt sure that he would account to John for all moneys expended, and hand over the surplus. That John himself was a defaulter was out of the question. Mr. Stull's constant supervision never gave him a chance to be dishonest, and he had made his regular deposit on the day he left. Stull also believed Enoch's statement that the young man had not betrayed his secret. No matter to what height his manager's stupid folly might rise, he still felt sure that he was to be trusted in this.

x.

MR. CRISMAN spent a very pleasant Sunday at Cherry Bridge, and he detailed to the ladies, with much more satisfaction than if Mr. Stratford had been present, his yachting experiences of the previous week. These were by no means extraordinary experiences, but they were rather novel to Mr. Crisman, and he talked about them to his heart's content. Mrs. Justin's heart was content before she had heard the half

of them; and Gay sometimes caught herself wondering if some of the things her lover told were of sufficient importance to deserve so much careful elucidation on his part and attention on her own. Of course she wanted to hear his adventures, but she was not very desirous to be told precisely how Pete Cummins and Charley Slocum sat together in the stern, and how Abe Henderson, who was just abaft the mast trying to smoke out one of those smuggled cigars which he had bought from a sailor on the Battery, sung out that there was a squall coming and would strike them on the port quarter in about six minutes, and that the best thing they could do was to put into the island until the blow was over, if they staid all night; and how everybody aboard, except Tom Wilson, knew that there was no likelihood of a squall, or, if there was, Abe didn't know anything about it, and that Abe was just trying on the nautical to torment Tom Wilson, who was making himself comfortable on a roll of sail-cloth in the bow—this comical Tom Wilson having on a blue flannel shirt which he bought too big by mistake, and full nineteen inches in the collar, giving him the air of a lady going out to an evening party, and causing him to be particularly anxious not to go on shore and make a guy of himself, which, of course, he would be obliged to do if a squall came up.

It was not that this, and similar incidents, possessed no interest for her, but Gay's mind was a quick one, and could comprehend situations upon very terse presentations. Mr. Crisman's elaboration of minutiae became, therefore, a little tiresome to her, although she did not acknowledge this to herself, and listened with such gentle attention that Mr. Crisman felt it was almost as pleasant to tell about these things as to be at the happening of them.

On Sunday morning he went to church with the two ladies, and in the afternoon he strolled with one, but the scent of the yacht trip hung around his conversation still. But he was so good-humored, so buoyant and hearty in his talk and manner, and withal so handsome, that Gay reproached herself every time there came stealing into her mind a sense of distaste for small vessels on salt water. It was a quiet, uneventful day, but Mrs. Justin and Gay Armatt enjoyed it very much. The conditions for enjoyment were so exactly what they ought to be, and it appeared so just, right, and perfectly natural that the presence of Mr. Crisman should give pleasure not only to Gay, but to her dear friend, that the pleasure came to these two ladies as the delightful consciousness of virtue comes to the virtuous.

When Gay took her charming, beaming face upstairs that night, she sat by the window and looked out into her future—her future

with Charley Crisman. It was very bright, brighter than the sunset. It was full of glowing visions of a voyage, not in a little boat upon a bay, but in a great ship upon the rolling ocean; of far-away and lovely lands; of the weird charms of foreign life, and the mountains and plains whence trickled the headwaters of literature; and through these visionary scenes she moved with Charley, hand in hand, until at last they came to a lovely rural home, which, after all, would be more charming than the ruins of the past or the palaces of to-day.

And then she rose, and the future faded, and in its stead she saw the sky, and there were some stars there which reminded her of the stars which had come twinkling out the week before, when she had walked home after dark from the hill where she had seen the sunset. And now it came into her mind that, for some reason or other, she did not know exactly why, it was more pleasant for Mr. Stratford not to be here on the Sundays Charley was here. This was very odd, and she did not try to explain it to herself. And so, with the Charley-smile still upon her lips, she went to bed.

Mr. Crisman did not immediately retire, but, lighting a cigar, he went out on the piazza to have a walk and a smoke, and to build some castles in the air. His thoughts went immediately forth to a medium-sized frame house, probably in the Queen Anne style, somewhere in the suburbs of the city. From the parlor and dining-room floor to a room in the attic which he intended to fit up with a work-bench, at which he could make all sorts of little things that would be needed about the house, he furnished this home. To be sure, he could not expect to be in it very much on week-days; for, as he had to be at the store at nine o'clock in the morning, and as it would take him at least an hour to reach the city, he would have to have his breakfast at half-past seven, and therefore get up at seven; and, as for coming home, he could not hope to reach the house before dark, except in the long summer days. But then there would be Sundays and holidays; and even on ordinary days, if they did not sit up too late, he could rise in the morning quite early enough to have a good time working in the garden and getting an appetite for his breakfast. He knew lots of fellows who lived out of town who did that. In some way or other, they really seemed to have more time to do things than his friends who lived in the city.

As to Gay, he pictured her as the most charming mistress of a house that the world ever saw. He did not suppose that she had any domestic abilities, for she could gain nothing of these while she was grinding away at school and at college; but all that sort of

thing would soon come to her, as it does to every woman who is worth anything. Of course they would have a servant, but there would be lots for Gay to do to keep her busy and contented while he was away. For one thing, he would have a poultry house and yard, and the care of the hens and chickens would give Gay no end of fun and occupation. He saw her, in his mind's eye, collecting the snow-white eggs, and tenderly caring for the downy little chicks. If his circumstances improved,—and there was reason to believe that, if he married, he would be promoted into the foreign woollens department,—he would have a cow, although, now he came to think of it, a good cow ought to give at least ten quarts of milk a day, and what he and Gay were to do with ten quarts of milk he could not see, unless, indeed, they churned, and, by George! that was a jolly idea! They would make their own butter, and Gay should have charge of it. He was glad Gay was not a rich girl, because she would take so much more pleasure in all this sort of thing than she would if she had been rich. She would find that she would have a lot to learn that they didn't teach in college. But, when she once came to give her mind to it, he knew very well that she would get along splendidly.

And then, throwing away the stump of his cigar, Mr. Crisman danced twice up and down the piazza, holding out his arms as if he were waltzing with Gay. And having finished this exercise, he went into the house, locked the hall-door, and betook himself to bed.

Mrs. Justin did not have a very long rest that night. She never could sleep when any one was walking up and down the piazza under her window; and when Gay married Mr. Crisman—and to-day Mrs. Justin had no doubt that this would happen—she hoped that she would cure him of this practice.

When Mr. Crisman had gone, and the week of ordinary life had begun again at Cherry Bridge, Gay let one day pass without saying anything on the subject, and then she asked Mrs. Justin if she did not think it somewhat strange that Mr. Stratford had not called upon them since he went back to the farmhouse.

"It has been scarcely three days since he was here," said Mrs. Justin, "and I do not think that can be considered a very long absence."

"That depends," said Gay. "It is only a half-hour drive for him. Have the people at the farm returned yet?"

"I have not heard that they have returned," said Mrs. Justin.

"Well, then," said Gay, thoughtfully, "from what you said about the state of the farm household when you invited the two gentle-

men here, I should think he must be having a very uncomfortable time of it."

Mrs. Justin possessed an excellent temper, but this remark irritated her. She felt that Gay was not called upon to interest herself in Mr. Stratford's welfare. And, more than that, she perceived in Gay's words something of a reproach to herself. Her conscience told her that this was not altogether undeserved. Affairs must be going on roughly at the farm, with no one but a very incompetent woman to manage the household, and it did not at all conform to her high ideas of hospitality to allow an old friend, such as Mr. Stratford was, to remain in discomfort with her own large house so near. But Stratford's intentions and conduct made it impossible for her to have him at her house while Gay was there. But that was no reason why the duties of friendship should be entirely neglected. She then remarked that she intended to drive over to the farm and find out when Mrs. People was expected back and how matters were going on there.

"I will go with you," said Gay.

Now did the irritation of Mrs. Justin increase so much that she was unable to conceal it, and she answered in a tone more severe than she had ever before used towards her young friend:

"It is not at all necessary, Gay, that you should visit the farm. I am going to the village this morning, and will then drive over and see if Mr. Stratford needs anything that I can do for him."

Gay could not fail to perceive that Mrs. Justin did not approve of her putting herself forward in the cause of Mr. Stratford's welfare, but she was not offended, though she said no more upon the subject. It might be that her friend was sensitive about having other people interfere in a case like this, which was clearly within her own province; and as Gay considered the matter, she thought of several other things which might have induced Mrs. Justin to set her aside in this affair. But Gay's considerations of these possible reasons did not in the slightest degree diminish her interest in Mr. Stratford.

Mrs. Justin was not only irritated but disappointed. Mr. Crisman's last visit had produced the impression upon her that perhaps, after all, there was no reason for her fears in regard to Stratford. The lovers appeared so happy and content in each other's company that even if Mr. Stratford found further opportunities of interfering with their engagement, he would discover that he had no ground to work on. As soon as he had gone Gay had ceased to think of him, and had returned to her allegiance to the man she was to marry. But now Crisman was scarcely out of the house when Gay was filled with anxiety about Mr. Stratford's

domestic comfort, and with disappointment that he did not come to see her. All this was very disheartening to Mrs. Justin. Mr. Stratford was out when she called at the farm-house, but her inquiries convinced her that he was probably doing very well, as it was evident that he had taken the general direction of his domestic economies into his own hands. She gave the woman in charge some advice in regard to the gentleman's comfort, but she made no report of her proceedings when she returned.

Gay asked no further questions about Mr. Stratford, and she and her friend soon returned to their ordinary condition of amicable intercourse. It was Mrs. Justin's custom to leave her visitors free to spend the mornings as they best pleased, and to claim that privilege for herself. The next morning Gay pleased not to read or study. She was restless and thoughtful, and concluded that she would take a walk. So she walked over the fields and hills to the little eminence where she had seen the sunset. She climbed up to the broad rail where she had sat, and she sat there again and looked at the sky. The sky was blue now, with white clouds floating over it, but it was not a very interesting sky, and Gay got down from the fence on the other side from that on which she had climbed up. Then she walked on into a country which was new to her, and in which she experienced some of the sensations of the adventurer, for she knew she was not now on Mrs. Justin's land.

She kept on until she came to the bottom of a hill, where there was a little brook; and when she had rested herself by its banks a few minutes, watching the hurrying water as it pushed around and between and over the big stones which lay in its course, she stepped upon one or two of the dryest of these stones, and was over the brook in a flash. She followed the opposite bank of the stream around the end of a low hill, and then she found herself in a pretty little valley with this mountain stream running down the middle of it. Not far away there was a clump of trees by the side of the brook, and just above these a man was fishing.

Almost as soon as she saw this man Gay knew it was Mr. Stratford. She stopped, uncertain whether or not to go on. Before the conversation of yesterday she would not have hesitated for a moment, but would have hurried, as fast as she could run, to see Mr. Stratford fish; but now a recollection of the words and, still more, the manner, of Mrs. Justin produced a vague impression upon her mind that she ought, perhaps, to turn around and go back the way she came. But instantly she began to ask herself what possible reason there

was for this impression? What was there in Mrs. Justin's words or manner which should prevent her from speaking to Mr. Stratford when she saw him? If he happened to turn his head she would be full in his view, and if he saw her going away what would he think of her? She would be treating him as if he were some stranger to be avoided. It would be most unkind and improper in her to behave to him in an unfriendly way, and so she would go on and speak to him.

This she did, but she did not run. She walked very sedately over the grass; and when she came near him he heard the slight rustling of her dress, and turned.

"Good-morning, Mr. Stratford," she said. "Shall I frighten the fish if I come there?"

Mr. Stratford was surprised, but very glad to see Gay. He put down his rod, and came forward to greet her. He said it did not matter in the least whether she frightened the fish or not, and wanted to know how she had happened to come this way.

When this had been explained, Gay begged him to go on with his fishing, because nothing would so much delight her as to see how he caught a trout. Thereupon they both approached the brook, and while Gay stood a little to one side, Mr. Stratford took up his rod and began with much dexterity to throw his fly among the ripples at the bottom of a tiny waterfall. In a few moments he caught a trout and threw it out upon the grass; then Gay ran up to it, dropped down on her knees, and was full of admiration for its beautiful colors and spots. If it had been Mr. Crisman who was fishing, Gay would have implored him to throw the poor little thing back into the water, but in regard to a fish hooked by Mr. Stratford she had no such thought. If he caught it, it was of course quite right that he should do so.

And now Mr. Stratford asked her if she would like to fish. Gay declared that she would be perfectly delighted to do so, but unfortunately she did not know how; she had never fished since she was a little girl, and then in the most primitive way, with worms. She had heard and read a good deal about artificial flies, but she had never before seen any one use them. Thereupon Mr. Stratford took out his book of flies, and showed Gay the various kinds of feather insects, and told her when and why he used this variety or that. Then she was very anxious to begin, and Stratford put the rod into her hands, explained the use of the reel, and going a little farther along the brook he began to give her lessons in managing the rod, throwing the fly, and in various other branches of trout-fishing. Gay's business in life was to learn, and she was so bright

and quick at seeing what ought to be done, and Stratford was so earnest and patient in teaching her, that after half an hour's practice she could make a fly skim above the surface of the water with something that resembled in a certain degree the skill of a practiced fisher.

In the course of time a trout actually rose to her fly, and she hooked it. With a wild, spasmodic jerk, which would have broken her tackle had the fish been a large one, she threw it far out on the grass, the line just grazing Mr. Stratford's hat as it flew over his head. She was now in raptures, and she fished on with much zest, although her success was small.

And so Gay did all the fishing, for Mr. Stratford assured her that he could fish any day, and that it was ever so much more pleasure to show her how to use the rod than to use it himself. And they walked and they talked, and Gay declared that she had found out something which was not taught in colleges, and that was that the way to superoxygenate the air was to fish. The atmosphere seemed truly full of exhilaration, and not only she herself, but everything else, seemed to be breathing it with delight.

"I wish Izaak Walton had written his book in Greek," cried Gay, "for then I would put it among my Greek reading next winter, and in that way keep before my mind this fussy little brook with real fishing fish in it. And now won't you show me again how to give that little wobble to the fly as I wave it?"

And so Mr. Stratford took Gay's little hand into his own, she still holding the rod, and the fly on the end of the line began to wobble itself more over the water, and less over the grass.

At length Stratford stopped and took out his watch. "I think, Miss Armatt," he said, "that we must now give up fishing for to-day. You will have just time enough to get home to lunch."

"You don't mean to say," exclaimed Gay, "that it is near one o'clock!"

"It is half-past twelve," said Stratford, "but I can show you a much shorter way to Mrs. Justin's house than that by which you came."

And now the little feather fly was put away with its brothers, the rod was disjointed and packed up, and Gay and Stratford walked along one edge of the stream until they came to a good place to cross, when he, with one foot upon a rock and the other on the bank, took both her hands in his, and she made a flying skip over the brook without any need of a stepping-stone. They now followed the course of the valley until they came to a fence, in one panel of which were movable bars, and these being taken down by Mr. Stratford, Gay passed

through. Then he put them up again, but remained on the other side from her.

"Now all you have to do," he said, "is to keep straight on until you get to the corner of that bit of wood. When you have turned that, you will see the house before you at the bottom of a long hill."

"But are you not coming to take lunch with us?" exclaimed Gay. "I thought, of course, you'd do that!"

"Oh, no," replied Stratford with a smile. "I couldn't lunch with ladies in these fishing clothes and muddy boots."

"The clothes are plenty good enough," said Gay; "and I am sure that Mrs. Justin won't like it at all when she hears you have been so near and wouldn't stop to lunch."

Stratford smiled, but shook his head.

"Then you will come to-morrow?" said Gay. "You haven't been to see us for ever so long; and I have six pages marked, on which there are things I want to ask you about."

Mr. Stratford stood by the fence, leaning on the upper rail. "Miss Armatt," he said, "I shall not be able to visit you to-morrow. In fact, as I am going to the city in a day or two, it will be some time before I can give myself the pleasure of calling at Mrs. Justin's house."

"I don't see what going to the city in a day or two has to do with it," said Gay, "when you live so near."

Stratford laughed, but made no answer to this remark. "You must not think, Miss Armatt," he said, "that I have any intention of evading those six marked pages. But I must not keep you here any longer, or Mrs. Justin will think you are lost. Good-bye, for just now." And he reached out his hand over the fence.

Gay put her hand in his, and as she did so she said nothing, but looked straight into his eyes with an expression full of interrogation.

"Good-bye," he said again. And then he gently dropped her hand, and she went her way.

Gay's way was now a thoughtful one, and her thoughts could have been formulated to express the idea that the best plan to expel the oxygen from the air was to have Mr. Stratford say the things he had been saying. There was something wrong, and she could not understand it. In fact, she soon gave up trying to understand it; and her mind, for the greater part of the walk home, was entirely occupied with the contemplation of the fact that never in her life had she met any one who, in certain respects, could be compared to Mr. Stratford as a companion. It was not merely that he knew so much about all sorts of things; it was a good deal more than that. His mind seemed to possess the quality of hospitality; it seemed

to open its doors to you, to ask you to come in and make yourself at home; and you could not help going in and making yourself at home—at least Gay could not. And she did not want to help it either. She had never known any one on whom, in certain respects, it was such a pleasure to depend as Mr. Stratford. Even when he helped her over the brook, or showed her how to use a fishing-rod, there was something encouraging and inspiring in his very touch.

And yet Gay's thoughts and sentiments in regard to Mr. Stratford did not interfere in the least with her thoughts and sentiments regarding Mr. Crisman. These were on a different plane, and in a different sphere. She did not exactly say this to herself, but reflections of similar significance passed across her mind, and being of such easy comprehension were not detained for consideration.

When Mrs. Justin heard where Gay had been, with whom she had met, how she had fished, how she had enjoyed it, what a perfectly lovely morning it had been, what a charming thing it was to have a man like Mr. Stratford teach one how to fish, how Mr. Stratford had declined to come to lunch, and a good deal of what he had said on this and other subjects, that lady listened in silence; her face was grave, and her heart was pained. She felt that Fate was against her in the effort she was making in behalf of the right. When she spoke she said a few words in regard to Mr. Stratford's visit to the city, and then changed the subject. In the course of an hour or two a basket of trout was sent over from the Bullripple farm, and they were cooked for supper; but Gay noticed that Mrs. Justin, who, as she knew, was very fond of trout, partook not of this dish.

Mrs. Justin's peace of mind was not increased when, next morning, she received a letter from Arthur Thorne requesting her permission to address Miss Armatt. Mr. Thorne wrote that he was aware that Mrs. Justin was not related to Miss Armatt, nor was she that young lady's guardian, but as Miss Armatt was at present a member of her family, he would consider it an instance of bad social faith were he to carry out his present intention of securing board in her neighborhood for the express purpose of visiting Mrs. Justin's house and endeavoring to win favor in the eyes of Miss Armatt, without frankly apprising Mrs. Justin of said intention. The letter closed with an earnest hope that this proposed step would meet with Mrs. Justin's approval.

"Is it possible," exclaimed the lady as she rose to her feet, with this letter crushed in her hand, "that Stratford has never told his friend of Mr. Crisman!"

For an hour Mrs. Justin walked the floor, this matter galloping through her mind, and then she sat down and wrote a letter to Mr. Thorne informing him of Gay's engagement to Mr. Crisman. She did not allude to the strangeness of the fact that he had not heard of this, and she made her letter as kind and as appreciative of honorable motives as she believed such a truly honorable man as Arthur Thorne deserved.

XI.

THE cyclones and the typhoons still continued to rage through the soul of J. Weatherby Stull as he daily visited Vatoldi's and beheld the performances of Enoch Bullripple. Whatever deed an absolute fool might do, that, in the eyes of Mr. Stull, did Enoch, and whatever a wise man might perform, that thing Enoch left undone. With John People gone he knew not whither, and not a soul on earth with whom he could share his misery and rage, Mr. Stull's condition was such that every hour threatened the downfall of Mr. Bullripple, and the simultaneous toppling over of the lofty social pedestal of the Stull family. But the head of the family had made that pedestal his only object of adoration, and it was that adoration which time after time saved the pedestal from the destruction threatened by its builder.

As has been said, Mr. Stull came every day to Vatoldi's, but he no longer brought his family, nor urged them to come. That restaurant, with its swaggering waiters and its flaunting placards of "Chowder" and "Golden Buck," was no place for them. In its present condition he did not wish to see the place patronized. He went there himself because he must know what was going on, but he would have been very glad if no one else had gone. Attracted by Enoch's showy inducements, and by the notoriety which the boycotters had given to the place, a great many persons took their meals at Vatoldi's. But they were not the former patrons of the establishment. They belonged to a much lower social sphere; and, had circumstances permitted, it would have delighted the soul of Mr. Stull to take each one of them by the neck and put him out into the street, and then to close the shutters of Vatoldi's and lock and bar its doors, keeping them closed and barred until affairs could be so ordered that he could reopen his establishment upon its old basis of order, propriety, and systematic excellence.

One afternoon Mr. Horace Stratford arrived in town, and being very desirous to obtain news of his landlord and landlady, from whom he had received but two very unsatisfactory notes, he repaired directly to Vatoldi's. When he reached the place he was surprised

to see quite a crowd before the door, who regarded with much lively interest a man who was taking a meal at a small table placed on the sidewalk directly in front of one of the large windows. Over this man's head hung a placard, on which was inscribed :

“YESTERDAY THE BOYCOTTERS GAVE ME
TWO DOLLARS
TO PLAY SHAM, AND TO-DAY I AM PAID
THREE DOLLARS
TO EAT, DRINK, AND BE MERRY.”

Mr. Stratford did not stop to ask questions; but, seeing Mrs. People inside the door, he immediately walked in and accosted her.

The good woman's face was beaming with the pleasure which frequently follows a benevolent action. A big policeman — all sorts of people now came to Vatoldi's — had just been partaking of a repast at a table near the door, and Mrs. People, who had been temporarily left in charge of the cashier's desk, and who liked to encourage the patronage of policemen in these troublous times, had cut a large slice of one of her own cherry pies, and had taken it to him with her own hands as a gratuitous addition to his meal.

“That's from me,” she said, in her brusque, cheerful way. “It's all right. Don't mention it.” And then she bustled back to the desk.

When the policeman came up to pay the amount of his check, Mrs. People, who was not an adept at addition and subtraction, gave him his change with a deficiency in the amount which was larger than the price of the piece of pie. The good policeman perceived the error, but hesitated a little before mentioning it to a person who had just been so generous to him. He stood for a moment undecided whether to speak or not, when Mrs. People exclaimed :

“Now don't say anythin' about that pie. That's all right. Did you think it was good? It ought to be, for I made it myself.” And then, with a jolly little nod, she turned aside to speak to a waiter, and the policeman, in a state of uncertain gratefulness, departed.

The glow of kindness upon Mrs. People's countenance brightened into the radiance of joy when she beheld Mr. Stratford. With outstretched hand she hurried to meet him, and poured forth an instantaneous torrent of questions regarding his welfare at the farm, broken by great bowlders of regret at the unfortunate state of affairs which obliged her to leave him there alone.

It was an hour when there were few persons in the long room, but had the place been crowded it would have been all the same to Mrs. People.

After a time Mr. Stratford began to ask questions. “This place seems very much changed,” he said, looking about him. “Has boycotting done all this?”

“The dear knows what it has done, and what it hasn't done,” said Mrs. People. “Enoch attends to the upstairs business, and I have my hands full tryin' to keep things straight in the kitchen. He is out now, and so I had to come up here; but he'll be back directly, and mighty glad he'll be to see you.”

“What is the meaning,” asked Stratford, “of that man eating at a table outside, with the people standing along the curb-stone looking at him?”

“Oh, that's one of Enoch's contrivances,” said Mrs. People with a laugh. “Yesterday the boycotters hired that man to come in here and get somethin' to eat; and, dear knows, they didn't give him money to git much; and when he had finished he went out on the pavement right in front of the door, and bent himself nearly double, and began to howl as if he was suff'rin', and to holler out that he'd been p'izenized by what had been given him to eat in here. As true as I live, sir, 'twasn't more'n half a minute before there was a crowd outside, a-blockin' up the pavement; and where they came from so quick I don't know; and that man in the middle of them a-howlin' and groanin' and shakin' his fist at the people in here for p'izenin' of him. It wouldn't 'a' been two minutes before there'd been a row, and windows broke, for all I know, but the very second that Enoch set eyes on the man and saw what was up, he made one dash out the front door, and grabbed the feller by the collar, and pulled him inside in no time. Then two of the waiters they took the man one by each arm and Enoch pushin' behind, and they whisked him out lively into the little back-yard, and then they got him down right flat on the bricks, and Enoch he called for a big bottle of olive oil to give to him quick to stop the p'izen. Then the feller he got frightened, not knowin' what he'd be made to take, and he sung out that he wasn't p'izenized at all, and that 'twas all sham. Then Enoch he sent the waiters away and let the man up, and then and there he made a bargain with him; and as he had been hired yesterday to make believe he was sick, Enoch hired him to come to-day and set out in front of the shop and eat, and let people see that the victuals we furnish here agree with him. Enoch has give orders that they're to take victuals out to him a little at a time, so's he can be kep' eatin' all day. This mornin' some boycotter's boys threw mud at him, but the perlice ketched 'em, and there was an end to that. And here comes Enoch now.”

Mr. Bullripple was quite as glad to see his

boarder as Mrs. People had been, and the two sat down at a table and had a long talk on the state of affairs. Mr. Stratford was greatly interested in Enoch's account of what he had done, for the old man told him everything, even to his method of getting rid of John People in order to have a clear field to work in.

"You see, sir," said Enoch, "what I'm about is a good sight deeper than what folks is likely to think that jus' looks at it from the outside. There's a rat in a hole in this Vatoldi business, and all these things that surprise you about the place is the stick that I'm tryin' to punch him out with; and I think that feller eatin' outside has just made the stick about long

enough to reach the mean, sneakin' varmint at the bottom of his hole. I'm almost dead sure I tetched him, for if he didn't stick out his head this mornin', I'm wuss mistaken than I ever was before in my life. I'm pretty sure that it won't be long now before I'll have him. And then, if I choose, Mr. Stratford,—I don't say that I'm goin' to do it, but I can do it, if I like,—I'm of the opinion I can show you your hundredth man. For if there's one man that sticks out sharp from any hundred people you know, it's this one I'm after."

"I have a very strong notion, Enoch," said Mr. Stratford, "if you catch the person you call your rat, and bring him to me yourself, that I shall see my hundredth man."

(To be continued.)

Frank R. Stockton.

EDWARD THOMPSON TAYLOR,

THE BOSTON BETHEL PREACHER.

THIS evangelist of the sea was born in Richmond, Virginia, December 25, 1793. He was a Christmas present of then unknown worth. He was a ruddy child; as of red earth the first Adam is fabled to have been made. As he grew up his brown hair had in it a tint of fire, as if from an ever-burning flame in his breast. He was a possessed man. To the credit of what was afterwards the rebel Confederate capital, we must pass this great nativity. His mother was Scotch, a governess in what, from something of superior rank recognized at that time in the homestead, was called "the great house," from which his father was banished for making such a supposed inferior match. The mother expired as the son came into the world. The little "bundle of baby" fell into the hands of a negro mammy, whose love and care ever after haunted his heart. Like Moses, drawn out of the bulrush ark in Egypt, or like Jesus in the manger, he was a foundling of providence, and foreordained to the business of preaching. It is a curious parallel between him and the elder Booth that as the distinguished actor wanted prayers over some dead pigeons, so Taylor held funeral services for chickens and kittens that had departed this life, and used not only persuasion, but even the whip, to gather his mourning audience of negro boys and girls, though the lash may have been as gentle as the oratory was wonderful in the six-year-old boy. When he was about seven, living near the city with a lady to whom the charge of him had been consigned, he was one day out picking up chips. A sea-captain passing by asked him if he did

not want to be a sailor. He instantly left his chips, as the first disciples did their nets and money-changers' tables. He did not even go back to the house to say good-bye, but, readily impressed, ran away with the free-spoken stranger, embarked on the sea and upon the for him wilder ocean of human life.

In the biography of Taylor, prepared by the Reverend Gilbert Haven and the Honorable Thomas Russell, one of his sons-in-law, the next ten years are called "a blank," and they were no doubt a hard experience, to which he was seldom inclined to refer. But void of instruction and discipline, that rough decade could not have been any more than were the "three years in Arabia" of the Apostle Paul. In his later ministry, having been taken to visit the famous Dr. Channing, on leaving the house he observed to the friend who had introduced him: "Channing has splendid talents; what a pity he had not been educated!" No school, academy, or college could equal in Taylor's mind that university of wind and wave through whose long and trying curriculum with many a sharp examination, for at last such triumphant graduation, he had passed. But he never forgot the rock he was hewn from in Virginia, the mother of States. A feeling, though no doctrine, of State sovereignty or State rights may have been at the bottom of his opposition to abolitionists, and of his resentment of John Brown's raid. But his abode in North Square would have been the quickest to open to a fugitive and the hardest out of which to get a runaway slave. He was a patriotic American, but his

yearning for native soil led him, when he was physically far past his prime, to make a pilgrimage to the old birthplace, and afterwards at a religious festival in Boston the tale of his travels was told. He had been anxious, he said, above all, to find one of his playmates, little Johnny by name. But he hunted the town after him in vain, until at length an old, white-headed, stooping man was discovered and brought to him; and that was all that was left of "little Johnny."

The present writer's recollection of this pathetic speech of reminiscence, which carried away a thousand hearers as with a flood of tears, advises him how impotent must be any attempt to expound the method of this "walking Bethel," as by Edward Everett he was called. It were as easy to describe the method of a cyclone, water-spout, or thunder-cloud. He was a piece of nature, yet also of perfect, marvelous, half-unconscious art. When an actor from New York went to see "how he did it," having heard of the effect he produced, all the watching of tone and gesture was foiled; and the curious expert had at length to retreat behind his pocket-handkerchief to hide his sobs. Like a rocket which, as it rises and blazes, unwraps manifold hues, and drops through the sky bewildering showers of sparks whose shapes are gone ere they can be marked and described, such was his spontaneous rhetoric, surprising nobody more than it did himself. In his bronzed and scarred face, that did not appear to have found itself in a looking-glass, and in the mellow voice, so musical unawares, was never an atom of pretense, artifice, or intoning affectation. When his own eyes were streaming, and the congregation's cheeks were wet, he would keep straight on without a quaver, and not break down, though everybody else was melted and overwhelmed. Once I asked Emerson to dine with him, and Emerson hesitated, saying he feared "Taylor was a cannon, better on the Common than in a parlor." But at the table what a flute, harp, or viol he proved to be! He represented, in New England, the tropical zone. He was a creature no less real than strange, as we have to take into our natural history not only the lark and robin and sparrow, but also the gait and flight and splendor of the parrot, oriole, and flamingo. But no repeater was he of other people's speech. Of all eminent Americans he was the most original and inimitable in his genius and style. Like his Master, he never wrote. He said he shivered from hand to foot at the sight of an inkstand and pen. If he undertook composition he was bereft of his power. He prepared himself after his own fashion for the pulpit; yet, if a text was handed

in at the last moment, it was like a drill-borer on a sudden touching deep in earth an oil or gas-well, which bursts up, perhaps, in flame. His most overcoming eloquence in public or private was provoked by a question on the spot. When the Methodist ministry, to which he had belonged, was ridiculed as deserving but small pay, he answered that the circuit-rider, with his Bible in his hand and before him "a wilderness of human souls," would be a match for any divinity-school graduate. He was an extemporizer, who did not, however, slight his task. He compared getting ready for the desk to fermentation: "When the liquor begins to swell and strain and groan and hum and fizz, then pull out the bung!" No idler or lounge, he observed closely and mused deeply. He was perpetually alert with look and ear and thought. He leaped in humor and sparkled with wit. He was not partial, but threw his span across the broad stream of human life. He was the parallax of this solar system of society. He presided at all boards, as he would have walked the quarter-deck of a ship, a commander sympathetic with his crew, having the courage of a lion and the tenderness of a lamb or a dove. When one of his daughters remonstrated with him about something he was doing, he replied he "had not sailed so long, to be run down by a schooner." At his conference meetings, which were more entertaining than a museum or theater, he would cry out to the slow speaker, "The King's business requires haste"; to the irrelevant, "Too far off"; to those of laborious utterance, "Lubricate"; and when there had been any impertinent or insolent display of declamation, a green, tigerish light came into his untamed eye, the signal of seizing on his prey and omen of self-assured victory. "How long shall we compass this Jericho before the walls tumble!" he cried out in my vestry. I hinted that if conversion may be immediate, the formation of character is a process. He "got mad" with me in a moment, and bounced out of the room. But the next time we met he hugged and kissed me in the street.

His method, or rather God's method with him, did not exclude study or books. But he was not a peruser of literature. He listened while one of his daughters read to him for long hours, day after day. He admired the sermons of South. But he never quoted anybody. He assimilated and reproduced. He said of those constant at the church prayer-meetings, "These are the absorbents"; and he was himself a huge absorbent from all that the world of knowledge and action had to give. It was a normal school of the whole creation he went to, and which he never could get

through the lessons of, till he had been at the head of every class.

His mode was not learned, logical, or dogmatic, but so impassioned that the wonder is that his spontaneous combustion should not have brought his constitution to ashes ere he was nearly seventy-eight years old. Before his imagination, ever on fire, heaven and hell lost their substance, fled as fading views or fugitive shows, while in the horizon arose or lowered only the saint's or sinner's spiritual state. "Walking large" like the Indian and treading disrespectfully over all denominational lines, this indeed catholic preacher judged nothing and nobody by sectarian rules. He transcended the transcendentalists,—he dug with his garden shovel under all the radical growths. He was the only speaker among us that could hold scholars and authors, farmers and sailors under the same spell. After he had addressed once our Boston Philosophic Club, Emerson said, "When the spirit has orb'd itself in a man, what is there to add?" When a brother begged of him a subject, he answered, "It would be too hot for you to hold."

In his rapt discourse he seemed to have no mortal body but what served for expression and was the medium of his mind; his eye, his hand, his very foot spoke. In the midst of other talkers he was like a President in his cabinet. What great orators we have had,—Everett with his studious grace and melodious voice, Webster the resistless and majestic, the oriental fancy of Choate and the silver trumpet of Phillips blazing against slavery the blast of doom! But in none of them was a power to fuse, blend, and kindle so divine as that of Taylor. His chimney did not smoke. His gun carried its charge without any stain in the barrel. If eloquence be clear delivery of the highest emotions and a communication so complete, through look and account, that the manner and gesture disappear in the lodging of sentiment and truth in the hearers' breasts, then this man succeeded. He was a live transparency and a self-operating telephone. How supple to the spirit and without a speck, to obscure or thwart, in himself!

He was in earnest. He said, "When I am full of grace, my voice is thunder." Dante was painted in the streets of Florence as "the man who had seen hell." Taylor beheld heaven and hell, like Swedenborg, as both alike eternal states in the soul. They were to him but the picture-book of its condition. Daniel Webster he called the best of bad men—but he wanted to see him again beyond! If Emerson should go to hell, he said, "it would change the climate, and the emigration would be that way." Parker, he declared, would have been in hell so long he would not know

he had ever been out of it, before he could even "mar the gilding on the Bible lids." To astonish a stagnant preacher, he said that his own dearly beloved wife was in hell, but that she was having a good time there, as the church formulary teaches that Christ "descended into hell." When one affirmed of a desperate transgressor that he would "go to the devil," Taylor stretched out his hand and exclaimed, "farther than that," meaning that the wicked have a worse fate than is implied in meeting any visible Satan, in the grapple they were sentenced to with their own remorse.

The pit played no such part as did the celestial region in the drama which this exhorter's sermons were. When he heard a liberal Christian, in a May-meeting speech, make much ado about evil and dwell with long and painful patience on the subject of sin, he compared him to "a beetle rolling his ball of dung to his hole in the sand." "The good Samaritan," he said, "did not maul the wounded Jew with texts." I cite but a few samples from memory, out of the thousand-fold repertory of illustration which no record of a verbal herbarium would be big enough to hold, even pressed and dry.

It is fifteen years since, on April 6, 1871, the man passed on, or *over*, as the French say, whom we cannot conceive to be dead or to have any goal or term. When he was about to go, drawing his last breath, as it is said the majority of persons do, at the turn or ebbing of the tide, he was told that he would soon be among the angels. He replied, "Folks are better than angels."

He was an opposer of Spiritualism. In a call which I made upon him with William Lloyd Garrison and George Thompson, the English abolitionist, he denounced the doctrine of ghostly manifestations which they zealously upheld; he averred that where he, Taylor, was, the spirits never came to stay. They must have been indeed very lively to have had or been of spirit more than he was himself. Infinite love with imperial will was in this apocalyptic angel "standing on the land and on the sea."

Most men who have been famous in the clerical profession live in their works, as we so politely call their printed words. But no scrap of his writing is to be found. Paul said his converts were his "epistle." Father Taylor's letters were the sailors, who carried his name and lessons to every shore and port of the globe. As seeds of plants are transported by insects or in the bodies of larger beasts, and as germs float, as in thistle-down, on every breeze, so by whoever touched or heard this minister-at-large and by every wind under the

whole heaven his teachings were borne to sow the world.

He was a moralist; he taught temperance. "I would put all the alcohol in a cave and roll a planet to the door."

The main argument for religion is such a man who is by its realities so inspired that he feels like the prophet who had "fire enough in his belly to burn up all the sins of mankind." But Taylor was not a man of vagaries, the heat-lightning of the mind. His peculiar faculty was to bring ideas into contact with life. "Higher law," he said, "it means stand from under." With the odd phrasing of transcendentalism he was offended; and he branded that new philosophy, of fifty years ago, as "a gull, with long wings, lean body, poor feathers, and miserable meat." A bright man said he was afraid of Taylor's wit, knowing he would make him cry before he got through. No error or iniquity could cloud or disperse the positive glory he saw or hush the hosannas he sang. So, without written register, he liveth evermore. His enthusiasm many floods of opposition or fogs of doubt or indifference could not quench or dim. To his thought the heavens were less than the human soul. There were no dimensions to his heart. He too was "greater than the temple." "O Lord," he once prayed for an old man, "take him to heaven, if his friend be there; but, at any rate and in all events, take him where his friend is!" That petition many friends of Taylor's, still in the flesh, are disposed for themselves to adopt and repeat.

No early Christianity, no medieval theology, or so-called ages of faith, could yield a better specimen than this man of trust, whether in a present providence or a future life. As he was leaving Boston, to journey for health in the East, he said to his friends, "I commit to you my wife, my children, and my church. But He, who gives a ton of herring for breakfast to the young whales, will take care of my children." When he was discoursing once to me about the Trinity and the only-begotten Son of God, I asked him if he thought there ever was a time when God had but one child, or when his family could be counted. He flushed and cried out, "There you are at your metaphysics!" The metaphysicians stood not high in his esteem. He said, "They are like fire-flies in a southern swamp—Flash, flash, and all is dark again." He tried to be a stanch Methodist in his creed. But no pulpit of his day showed a catholicity to match his own. When a denominational brother declined to enter his desk because a Unitarian had been in it, he left him at the end of the aisle, fell on his knees at the foot of the pulpit-stairs and exclaimed, "O Lord, deliver us, here in

Boston, from bigotry and from bad rum; thou knowest which is worst, for I do not." The Reverend Doctor Lyman Beecher, meeting him one day in the street, said humorously, "Well, Brother Taylor, who is cheating? Are you cheating the Unitarians, or are the Unitarians cheating you?" Instantly came the reply, "The fact is, Brother Beecher, a third party has come in that wants to have all the cheating to itself." He loved Ralph Waldo Emerson, as Emerson did him, they being clerical cotemporaries. But he said, "Emerson knows nothing more about Christianity than Balaam's ass did of Hebrew; but I have watched him, and I find in him no fault. I have laid my ear close to his heart, and cannot detect any jar in the machinery." Of another person, nearly connected with himself, being asked if his friend had been converted to religion, he answered, "No, he is not a saint, but he is a very sweet sinner." As he was dining at my table with Doctor William Ellery Channing and my dear colleague, Doctor Charles Lowell, the latter inquired about a famous preacher of Taylor's acquaintance at the North End in Boston, where the Sailors' Bethel was, adding, "I should like very much to see him." Taylor broke out with, "You cannot see him, sir; he is behind his Master."

But for his unsurpassed independence of will and character, Taylor would have melted and been dissolved in his rarely equaled sympathies for every living creature. As I walked with him on the public garden in Boston, a sparrow, startled from a clump of bushes by our tread, flew in fright away. He stopped on the gravel path, looked and stretched his hand after the bird, squeezing his fingers gently together in a sort of caress, and said to the sparrow, "I would not hurt you." But, on another occasion, he declared to me, "If there were in the Boston Port Society any discontent, I would show them the back seams of my stockings very quick." It would have been hard to tell whether he most loved Boston, or Boston most loved him. Never was any morose or gloomy expression caught on his face. His charm was that he was a cheerful Christian. He said of believers of the long-visaged type, "They seem to have killed somebody and just come back from burying the body." On the doorstep of my house, as he went out to make a call, he turned and said, "Laugh till I get back." When John Quincy Adams had addressed the company at a Unitarian festival as "brothers and sisters," Taylor said, "My ears have heard and mine eyes have seen a wondrous thing,—the man with the army and navy of the United States at his nod and beck, saying here, 'brothers and sisters.'" He was not only a preacher, of

genius unlike any other, but a faithful pastor to visit the needy of the flock. But he said of a certain member of it who kept continually falling back into drunken ways, "He is an expensive machine; I have to keep mending him all the time; but I will never give him up."

In extemporaneous utterance Taylor has in no community ever been excelled. His was indeed a marvelous fervor and flow. He made an assembly of the clergy shake with irresistible laughter, as with perfect mimicry he took off their own manner of preaching, with the hand and arm stretched one way in gesture, and their eye in another direction hunting after the place on the manuscript page. But seldom indeed has any actor or orator been possessed in like measure, or rather beyond all calculable degree, with the dramatic gift. He astonished the late Dr. Bellows, with whom he sat at my board, as, without rising from his chair, he enacted the spinning dervish, a figure he had himself seen in his travels abroad, and which he made us see, though not stirring from the room where we sat and ate. It could not have been done by Kean or Booth. In the Revelation it is written, "And I saw a great white throne, and him that sat on it, from whose face the earth and the heaven fled away; and there was found no place for them." Reverently we may apply this sublime verse to illustrate how, before a divinely inspired human imagination,

sublunary things flee and become as chaff in the wind from the threshing-floor, or put on new shapes as symbols and ciphers of realities which with the soul abide forever.

"Can a Calvinist be a Christian?" asked Taylor of Doctor Horace Bushnell. "Certainly he can," Bushnell replied. "Not so fast," rejoined Taylor. "Suppose, to the elect in heaven by sovereign decree with no claim beside, the Lord should come and say, 'Let us turn this stick round, and give the doomed at the other end a chance, while you take a spell in their torment, would the saints by arbitrary favor submit?'" Bushnell laughed, but offered no rebuttal to the query. Yet Taylor was not a Universalist in the sense of making the inner door of the tomb open into paradise immediately for all. When one scouted, in his presence, the notion of a retribution to come, he remarked, lifting his thumb and finger significantly to his nose, "We all have a sentimentality of that sulphur." But he was hospitable to any stranger, lay or clerical, in his church. "Come up," he cried to them; "my pulpit has no doors."

Perhaps these memorial fragments may hint a consistent whole. They may be formed into an image of the great friend and servant of the mariners, their priest without cowl or frock; or revive for some the actual traits in him which no abstract or analytic disquisition could clearly and fully set forth.

C. A. Bartol.

FATHER TAYLOR AND ORATORY.

I HAVE never heard but one essentially perfect orator — one who satisfied those depths of the emotional nature that in most cases go through life quite untouched, unfed — who held every hearer by spells which no conventionalist, high or low — nor any pride or composure, nor resistance of intellect — could stand against for ten minutes.

And by the way, is it not strange, of this first-class genius in the rarest and most profound of humanity's arts, that it will be necessary (so nearly forgotten and rubbed out is his name by the rushing whirl of the last twenty-five years) to first inform current readers that he was an orthodox minister, of no particular celebrity, who during a long life preached especially to Yankee sailors in an old fourth-class church down by the wharves in Boston — had practically been a sea-faring man through his earlier years — and died April 6, 1871, "just as the tide turned, going out with the ebb as an old salt should"? His name is now comparatively unknown outside

of Boston, and even there (though Dickens, Mrs. Jameson, Dr. Bartol, and Bishop Haven have commemorated him) is mostly but a reminiscence.

During my visits to "the Hub," in 1859 and '60 I several times saw and heard Father Taylor. In the spring or autumn, quiet Sunday forenoons, I liked to go down early to the quaint ship-cabin-looking church where the old man ministered — to enter and leisurely scan the building, the low ceiling, everything strongly timbered (polished and rubbed apparently), the dark rich colors, the gallery, all in half-light, and smell the aroma of old wood, to watch the auditors, sailors, mates, "matlows," officers, singly or in groups, as they came in, their physiognomies, forms, dress, gait, as they walked along the aisles, their postures, seating themselves in the rude, roomy, undoorred, uncushioned pews, and the evident effect upon them of the place, occasion, and atmosphere.

The pulpit, rising ten or twelve feet high,

against the rear wall, was backed by a significant mural painting, in oil—showing out its bold lines and strong hues through the subdued light of the building — of a stormy sea, the waves high-rolling, and amid them an old-style ship, all bent over, driving through the gale, and in great peril — a vivid and effectual piece of limning, not meant for the criticism of artists (though I think it had merit even from that standpoint), but for its effect upon the congregation, and what it would convey to them.

Father Taylor was a moderate-sized man, indeed, almost small (reminded me of old Booth, the great actor, and my favorite of those and preceding days), well advanced in years, but alert, with mild blue or gray eyes, and good presence and voice. Soon as he opened his mouth I ceased to pay any attention to church or audience or pictures or lights and shades; a far more potent charm entirely swayed me. In the course of the sermon (there was no sign of any MS., or reading from notes), some of the parts would be in the highest degree majestic and picturesque. Colloquial in a severe sense, it often leaned to Biblical and oriental forms. Especially were all allusions to ships and the ocean and sailors' lives of unrivaled power and life-likeness. Sometimes there were passages of fine language and composition, even from the purist's point of view. A few arguments, and of the best, but always brief and simple. In the main, I should say, of any of these discourses, that the old Demosthenean rule and requirement of "action, action, action," first in its inward and then its outward sense, was the quality that had leading fulfillment.

I remember I felt the deepest impression from the old man's prayers, which invariably affected me to tears. Never, on any similar or other occasions, have I heard such impassioned pleading — such human-harassing reproach (like Hamlet to his mother, in the closet) — such probing to the very depths of that latent conscience and remorse which probably lie somewhere in the background of every life, every soul. For when Father Taylor preached or prayed, the rhetoric and art, the mere words (which usually play such a big part), seemed altogether to disappear, and the *live feeling* advanced upon you and seized you with a power before unknown. Everybody felt this marvelous and awful influence. One young sailor, a Rhode Islander (who came every Sunday, and I got acquainted with, and talked to once or twice as we went away), told me, "that must be the Holy Ghost we read of in the Testament."

I should be at a loss to make any comparison with other preachers or public speakers. When a child I had heard Elias Hicks, and Father Taylor (though so different in personal appearance, for Elias was of tall and most shapely form, with black eyes that blazed at times like meteors) always reminded me of him. Both had the same inner, apparently inexhaustible, fund of volcanic passion — the same tenderness, blended with a curious remorseless firmness, as of some surgeon operating on a beloved patient. Hearing such men sends to the winds all the books, and formulas, and polished speaking, and rules of oratory.

Talking of oratory, why is it that the unsophisticated practices often strike deeper than the trained ones? Why do our experiences perhaps of some local country exhorter — or often in the West or South at political meetings — bring the most rapid results? In my time I have heard Webster, Clay, Edward Everett, Phillips, and such *célèbres*; yet for effect and permanence I recall the minor but life-eloquence of men like John P. Hale, Cassius Clay, and one or two of the old abolition "fanatics" ahead of all those stereotyped fames. Is not — I sometimes question — the first, last, and most important quality of all, in training for a "finished speaker," generally unsought, unrecked of, both by teacher and pupil? Though may be it cannot be taught anyhow. At any rate, we need to understand clearly the distinction between oratory and elocution. Under the latter art, including some of high order, there is indeed no scarcity in the United States, — preachers, lawyers, lecturers, etc. With all, there seem to be few real orators — almost none.

I repeat, and would dwell upon it (more as suggestion than mere fact) — among all the brilliant lights of bar or stage I have heard in my time — for years in New York and other cities I haunted the courts to witness notable trials, and have heard all the famous actors and actresses that have been in America the past fifty years — though I recall marvelous effects from one or other of them, I never had anything in the way of vocal utterance to shake me through and through, and become fixed, with its accompaniments, in my memory, like those prayers and sermons — like Father Taylor's personal electricity and the whole scene there — the prone ship in the gale, and dashing wave and foam for background — in the little old sea-church in Boston, those summer Sundays just before the Secession war broke out.

EDWARD THOMPSON TAYLOR.

KEATS'S GREEK URN.

WHEN the young poet wrought so unware
From purest Parian, washed by Grecian seas,
And stained to amber softness by the breeze
Of Attic shores, his Urn, antiquely fair,—
And brimmed it at the sacred fountain, where
The draught he drew were sweet as Castaly's,—
Had he foreseen what souls would there appease
Their purer thirsts, he had not known despair!
About it long processions move and wind,
Held by its grace,— a chalice choicely fit
For Truth's and Beauty's perfect interfuse,
Whose effluence the exhaling years shall find
Unwasted: for the poet's name is writ
(Firmer than marble) in Olympian dew!

Margaret J. Preston.

THE STARS.

THE NEW ASTRONOMY.

IN the South Kensington Museum there is, as everybody knows, an immense collection of objects, appealing to all tastes and all classes, and we find there at the same time people belonging to the wealthy and cultivated part of society, lingering over the Louis Seize cabinets or the old majolica, and the artisan and his wife, studying the statements as to the relative economy of baking-powders, or admiring Tippoo Saib's wooden tiger.

There is one shelf, however, which seems

to have some attraction common to all social grades, for its contents appear to be of equal interest to the peer and the costermonger. It is the representation of a *man* resolved into his chemical elements, or rather, an exhibition of the materials of which the human body is composed. There is a definite amount of water, for instance, in our blood and tissues, and there on the shelf are just so many gallons of water in a large vessel. Another jar shows the exact quantity of carbon in us; smaller bottles contain our iron and our phosphorus in just proportion, while others exhibit still other constituents of the body, and the whole reposes on the shelf, as if ready for the

TYPES OF STELLAR SPECTRA.

THE MILKY WAY. (FROM A STUDY BY E. L. TROUVELOT, BY PERMISSION OF CHARLES SCRIBNER'S SONS.)

coming of a new Frankenstein, to re-create the original man and make him walk about again as we do. The little vials that contain the different elements which we all bear about in small proportions are more numerous, and they suggest, not merely the complexity of our constitutions, but the identity of our elements with those we have found by the spectroscope, not alone in the sun, but even in the distant stars and nebulae, for this wonderful instrument of the New Astronomy can find the traces of poison in a stomach or analyze a star, and its conclusions lead us to think that the ancients were nearly right when

they called man a microcosm, or little universe. We have literally within our own bodies samples of the most important elements of which the great universe without is composed, and you and I are not only like each other, and brothers in humanity, but children of the sun and stars in a more literal sense, having bodies actually made in large part of the same things that make Sirius and Aldebaran. They and we are near relatives.

But if near in kind, we are distant relatives in another way, for the sun, whose remoteness we have elsewhere tried to give an idea of, is comparatively close at hand; quite at hand,

A FALLING MAN.

one may say, for if his distance, which we have found so enormous, be represented by that of a man standing so close beside us that our hand may rest on his shoulder, to obtain the proportionate distance of one of the *nearest* stars, like Sirius, for instance, we should need to send the man over a hundred miles away. It is probably impossible to give to any one an adequate idea of the extent of the sidereal universe; but it certainly is specially hard for the reader who has just realized with difficulty the actual immensity of the distance of the sun, and who is next told that this distance is literally a physical point

as seen from the nearest star. The jaded imagination can be spurred to no higher flight, and the facts and the enormous numbers that convey them will not be comprehended.

Look down at one of the nests of those smallest ants, which are made in our paths. To these little people, we may suppose, the other side of the gravel walk is the other side of the world, and the ant who has been as far as the gate, a greater traveler than a man who comes back from the Indies. It is very hard to think not only of ourselves as relatively far smaller than such insects, but that, less than such an ant-hill is to the whole landscape, is our solar system itself, in comparison with the new prospect before us — yet so it is.

All greatness and littleness are relative. When the traveler from the great star Sirius (where, according to the author of "*Micromegas*," all the inhabitants are proportionately tall and proportionately long-lived) discovered our own little solar system, and lighted on what we call the majestic planet Saturn, he was naturally astonished at the pettiness of everything compared with the world he had left. That the Saturnian inhabitants were in his eyes a race of mere dwarfs (they were only a mile high, instead of twenty-four miles like himself) did not make them contemptible to his philosophic mind, for he reflected that such little creatures might still think and reason; but when he learned that these puny beings were also correspondingly short-lived, and passed but fifteen thousand years between the cradle and the grave, he could not but agree that this was like dying

as soon as one was born, that their life was but a span, and their globe an atom. Yet it seems that when one of these very Saturnian dwarfs came afterward with him to our own little ball, and by the aid of a microscope discovered certain animalculæ on its surface, and even held converse with two of them, he could not in turn make up his own mind that intelligence could inhere in such invisible insects, till one of them (it was an astronomer with his sextant) measured his height to an inch, and the other, a divine, expounded to him the theology of some of these mites, according to which all the heavenly host,

A FLASH OF LIGHTNING. (FROM A PHOTOGRAPH BY DR. H. G. PIFFARD.)

including Saturn and Sirius itself, were created for *them*.

Do not let us hold this parable as out of place here, for what use is it to write down a long series of figures expressing the magnitude of other worlds, if it leave us with the old sense of the importance to creation of our own, and what use to describe their infinite number to a human mite who reads and remains of the opinion that *he* is the object they were all created for?

Above us are millions of suns like ours. The Milky Way (shown on page 587) spreads among them, vague and all-surrounding, as a type of the infinities yet unexplored, and of the world of *nebulæ* of which we still know so little. Let us say at once that it is impossible here to undertake the description of the discoveries of the New Astronomy in this region, for we can scarcely indicate the headings of the chapters which would need to be written to describe what is most important.

The first of these chapters (if we treated our subjects in the order of distance) would be one on space itself, and our changed ideas of the void which separates us from the stars. Of this we will only say in passing, that the old term "the temperature of space" has been nearly abrogated, for while it used to be supposed that more than half of the heat which warmed the earth came from this mysterious "space" or from the stars, it is now recog-

nized that the earth is principally warmed only by the sun. Of the contents of the region between the earth and the stars, we have, it must be admitted, still little but conjecture, though perhaps that conjecture turns more than it used to the idea that the void is not a real void, but that it is occupied by something which, if highly attenuated, is none the less matter; and something other and more than the mere metaphysical conception of a vehicle to transmit light to us.

Of the stars themselves, we should need another chapter to tell what has been newly learned as to their color and light, even by the old methods, that is, by the eye and the telescope alone; but if we cannot dwell on this, we must at least refer, however inadequately, to what American astronomers are doing in this department of the New Astronomy, and first in the photometry of the stars, which has assumed a new importance of late years, owing to the labors carried on in this department at Cambridge.

That one star differs from another star in glory we have long heard, but our knowledge of physical things depends largely on our ability to answer the question, "how much?" and the value of this new work lies in the accuracy and fullness of its measures, for in this case the whole heavens visible from Cambridge to near the southern horizon have been surveyed, and the brightness of every

SPECTRA OF STARS IN PLEIADES.

naked-eye star repeatedly measured, so that all future changes can be noted. This great work has taxed the resources of a great observatory, and its results are only to be adequately valued by other astronomers; but Professor Pickering's own investigations on variable stars have a more popular interest. It is surely an amazing fact that suns as large or larger than our own should seem to dwindle almost to extinction, and regain their light within a few days or even hours; yet the fact has long been known, while the cause has remained a mystery. A mystery, in most cases, it remains still, but in some we have begun to get knowledge, as in the well-known instance of Algol, the star in the head of Medusa. Here it has always been thought probable that the change was due to something coming between us and the star; but it is on this very account that the new investigation is more interesting, as showing how much can be done on an old subject by fresh reasoning alone, and how much valuable ore may lie in material which has already been sifted. The discussion of the subject by

Professor Pickering, apart from its elevated aim, has if only in its acute analysis only the interest belonging to a story where the reader first sees a number of possible clues to some mystery, and then the gradual setting aside, one by one, of those which are only loose ends, and the recognition of the real ones which lead to the successful solution. The skill of the novelist, however, is more apparent than real, since the riddle he solves for us is one he has himself constructed, while here the enigma is of nature's propounding; and if the solution alone were given us, the means by which it is reached would indeed seem to be inexplicable.

This is especially so when we remember what a point there is to work on, for the whole system reasoned about, though it may be larger than our own, is at such a distance that it appears, literally and exactly, far smaller to the eye than the point of the finest sewing-needle; and it is a course of accurate reasoning, and reasoning alone, on the character of the observed changing brightness of this point,

which has not only shown the existence of some great dark satellite, but indicated its size, its distance from its sun, its time of revolution, the inclination of its orbit, and still more. The existence of dark invisible bodies in space, then, is in one case, at least, demonstrated, and in this instance the dark body is of enormous size, for, to illustrate by our own solar system, we should probably have to represent it in imagination by a planet or swarm of planetoids hundreds of times the size of Jupiter, and (it may be added) whirling around the sun at less than a tenth the distance of Mercury.

Of a wholly different class of variables are those which have till lately only been known at intervals of centuries, like that new star Tycho saw in 1572. I infer from numerous inquiries that there is such a prevalent popular notion that the "Star of Bethlehem" may be expected to show itself again at about the present time, that perhaps I may be excused for answering these questions in the present connection.

In the first place, the idea is not a new, but a very old, one, going back to the time of Tycho himself, who disputed the alleged identity of his star with that which appeared to the shepherds at the Nativity. The evidence relied on is, that bright stars are said to have appeared in this constellation repeatedly at intervals of from three hundred and eight to three hundred and nineteen years (though even this is uncertain); and as the mean of these numbers is about three hundred and fourteen, which again is about one-fifth of 1572 (the then number of years from the birth of Christ), it has been suggested, in support of the old notion, that the Star of Bethlehem might have been a variable, shining out every three hundred and fourteen or three hundred and fifteen years; whose fifth return would fall in with the appearance that Tycho saw, and whose *sixth* return would come in 1886 or 1887. This is all there is about it, and there is nothing like evidence, either that this was the star seen by the Wise Men, or that it is to be seen again by us. On the other hand, nothing in our knowledge, or rather in our ignorance, authorizes us to say positively it cannot come again, and it may be stated for the benefit of those who like to believe in its speedy return, that if it does come, it will make its appearance some night in the northern constellation of Cassiopeia's chair, the position originally determined by Tycho at its last appearance, being twenty-eight degrees and thirteen minutes from the pole, and twenty-six minutes in right ascension.

We were speaking of these new stars as having till lately only appeared at intervals of

SPECTRUM OF ALDEBARAN.

SPECTRUM OF VEGA.

GREAT NEBULA IN ORION. (FROM A PHOTOGRAPH BY A. A. COMMON, F. R. S.)

centuries; but it is not to be inferred that if they now appear oftener it is because there are more of them. The reason is, that there are more persons looking for them, and the fact is recognized that, if we have observers enough and look closely enough, the appearance of "new stars" is not so very rare a phenomenon. Every one at all interested in such matters remembers that in 1866 a new star broke out in the Northern Crown so suddenly that it was shining as bright as the Polar Star, where six hours before there had been nothing visible to the eye. Now all stars are not as large as our sun, though some are much larger; but there are circumstances which make it improbable that this was a small or near object, and it is well remembered how the spectroscope showed the presence of abnormal amounts of incandescent hydrogen, the material which is perhaps the most widely dif-

fused in the universe (and which is plentiful, too, in our own bodies), so that there was some countenance to the popular notion that this was a world in flames. We were, at any rate, witnessing a catastrophe which no earthly experience can give us a notion of, in a field of action so remote that the flash of light which brought the news was unknown years on the way, so that all this — strange but now familiar thought — occurred long before we *saw* it happen. The star faded in a few days to invisibility to the naked eye, though not to the telescope; and, in fact, all these phenomena at present appear to be rather enormous and sudden enlargements of the light of existing bodies than the creation of absolutely new ones; while of these "new stars," the examples may almost be said to be now growing numerous, two having appeared in the last two years.

Not to enlarge, then, on this chapter of photometry, let us add, in reference to another department of stellar astronomical work, that the recognized master in the study of double stars the world over is not an astronomer by profession, at the head of some national observatory in Berlin or Paris, but a stenographer in the Chicago law-courts, Mr. W. S. Burnham, who, after his day's duties, by nightly labor, prolonged for years with the small means at an amateur's command, has perhaps added more to our knowledge of his special subject in ten years than all other living astronomers.

We have only here alluded to the spectroscope in its application to stellar research, and we cannot now do more than to note the mere headlines of the chapters that should be written on it.

It is the memorable fact, that after reaching across the immeasurable distances, we find that the stars are like *us*; like in their ultimate elements to those found in our own sun, our own earth, our own bodies. Any fuller view of the subject than that which we here only indicate would commence with the evidence of this truth, which is perhaps on the whole the most momentous our science has brought us, and with which no familiarity should lessen our wonder, or our sense of its deep and permanent significance.

Next, perhaps, we should understand that, invading the province of the Old Astronomy, the spectroscope now tells us of the motions of these stars, which we cannot see move; motions in what we have always called the "fixed" stars, to signify a state of fixity to the human eye which is such that to it at the close of the nineteenth century they remain in the same relative positions that they occupied when that eye first looked on them, in some period long before the count of centuries began.

In perhaps the earliest and most enduring work of man's hands, the great pyramid of Egypt, is a long straight shaft, cut slopingly through the solid stone, and pointing, like a telescope, to the heavens near the pole. If we look through it now we see — nothing; but when it was built it pointed to a particular star which is no longer there. That pyramid was built when the savages of Britain saw the Southern Cross at night, and the same slow change in the direction of the earth's axis itself that in thousands of years has borne that constellation to southern skies has carried the stone tube away from the star that it once pointed at. The actual motion of the star itself, relatively to our system, is slower yet — so inconceivably slow that we can hardly realize it by comparison with the duration of the longest periods of human history. The

stone tube was pointed at the star by the old Egyptians, but "Egypt itself is now become the land of obliviousness, and dotheth. Her ancient civility is gone, and her glory hath vanished as a phantasma. She poreth not upon the heavens, astronomy is dead unto her, and knowledge maketh other cycles. Canopus is afar off, Memnon resoundeth not to the Sun, and Nilus heareth strange voices." In all this lapse of ages the star's own motion could not have so much as carried it across the mouth of the narrow tube. Yet a motion to or from us of this degree, so slow that the unaided eye could not see it in thousands of years of watching, the spectroscope first, efficiently in the hands of the English astronomer, Dr. Huggins, and later in those of Professor Young of Princeton, not only reveals at a look, but tells us the amount and direction of, in a way that is as strange and unexpected, in the view of our knowledge a generation ago, as its revelation of the essential composition of the bodies themselves.

Again, in showing us this composition, it has also shown us more, for it has enabled us to form a conjecture as to the relative ages of the stars and suns; and this work of classifying them, not only according to their brightness, but each after his kind, we may observe was begun by a countryman of our own, Mr. Rutherford, who seems to have been among the first after Fraunhofer to apply the newly invented instrument to the stars, and quite the first to recognize that these were, broadly speaking, divisible into a few leading types, depending not on their size but on their essential nature. After him Secchi (to whom the first conception is often wrongly attributed) developed it, and gave four main classes into which the stars are in this way divisible, a classification which has been much extended by others; while the first carefully delineated spectra were those of Dr. Huggins, who has done so much for all departments of our science that in a fuller account his name would reappear in every chapter of this New Astronomy, and than whom there is no more eminent living example of its study. Owing to their feeble light, years were needed when he began his work to depict completely so full a single spectrum as that he gives of Aldebaran, though he has lived to see stellar spectrum photography, whose use he first made familiar, producing in its newest development, which we give here, the same result in almost as many minutes. Before we present this latest achievement of celestial photography, let us employ the old method of an engraving made from eye-drawings once more, to illustrate on page 586 the distinct character of these spectra, and their meaning. In the telespectroscope, the star is drawn out into

a band of colored light, but here we note only in black and white the lines which are seen crossing it, the red end in these drawings being at the left, and the violet at the right; and we may observe of this illustration, that though it may be criticised by the professional student, and though it lack to the general reader the attraction of color, or of beautiful form, it is yet full of interest to any one who wishes to learn the meaning of the message the star's light can be made to yield through the spectroscope, and to know how significant the differences are it indicates between one star and another, where all look so alike to the eye. First is the spectrum of a typical white or blue-white star, Sirius, the very brightest star in the sky, and which we all know. The brighter part of the spectrum is a nearly continuous ribbon of color, crossed by conspicuous, broad, dark lines, exactly corresponding in place to narrower ones in our sun, and due principally to hydrogen. Iron and magnesium are also indicated in this class, but by too fine lines to be here shown.

Sirius, as will be presently seen, belongs to the division of stars whose spectrum indicates a very high temperature, and in this case, as in what follows, we may remark (to use in part Mr. Lockyer's words) that one of the most important distinctions between the stars in the heavens is one not depending upon their mass or upon anything of that kind, but upon conditions which make their spectra differ just in the way that in our laboratories the spectrum of one and the same body will differ at different temperatures.

What these absolutely are in the case of the stars, we may not know, but placing them in their most probable relative order, we have taken as an instance of the second class or lower-temperature stage our own sun. The impossibility of giving a just notion of its real complexity may be understood, when we state that in the recent magnificent photographs by Professor Rowland, a part of this spectrum alone occupies something like fifty times the space here given to the whole, so that, crowded with lines as this appears, scarcely one in fifty of those actually visible can be given in it. Without trying to understand all these now, let us notice only the identity of two or three of its principle elements with those found in other stars, as shown by the corresponding identity of some leading lines. Thus, C and F (with others) are known to be caused by hydrogen; D, by sodium; *b*, by magnesium; while fainter lines are given by iron and by other substances. These elements can be traced by their lines in most of the different star-spectra on this plate, and all those named are constituents of our own frames.

The hydrogen lines are not quite accurately

shown in the plate from which our engraving is made; those in Sirius, for instance, being really wider by comparison than they are here given, and we may observe in this connection, that by the particular appearance such lines wear in the spectrum itself, we can obtain some notion of the *mass* of a star, as well as of its chemical constitution. We can compare the essential characteristics of such bodies then without reference to their apparent size, or as though they were all equally remote; and it is a striking thought that when we thus rise to an impartial contemplation of the whole stellar universe, our sun, whose least ray makes the whole host of stars disappear, is found to be not only itself a star, but by comparison a small one — one at least which is more probably below than above the average individual of its class, while some, such as Sirius, are not impossibly hundreds of times its size.

Then comes a third class, such as is shown in the spectrum of the brightest star in Orion, looking still a little like that of our sun, but yet more distinctively in that of the brightest star in Hercules, looking like a columnar or fluted structure, and concerning which the observations of Lockyer and others create the strong presumption, not to say certainty, that we have here a lower temperature still. Antares and other reddish stars belong to this division, which in the very red stars passes into the fourth type; and there are more classes and subclasses without end, but we invite here attention particularly to the first three, much as we might present a child, an adult, and an old man, as types of the stages of human existence without meaning to deny that there are any number of ages between. We can even say that this may be something more than a mere figure of speech, and that a succession in age is not improbably pointed at in these types.

We may have considered — perhaps not without a sort of awe at the vastness of the retrospect — the past life of the worlds of our own system, from our own globe of fluid fire as we see it by analogy in the past, through the stages of planetary life to the actual condition of our present green earth and on to the stillness of the moon. Yet the life history of our sun, we can hardly but admit, is indefinitely longer than this. We feel, rather than comprehend, the vastness of the period that separates our civilization from the early life of the world; but what is this to the age of the sun, which has looked on and seen its planetary children grow? Yet if we admit this temperature classification of the stars, we are not far from admitting that the spectroscope is now pointing out the stages in the life of suns themselves; suns just beginning their life of

almost infinite years; suns in the middle of their course; suns which are growing old and casting feebler beams,—all these and many more it brings before us.

Another division of our subject would, with more space, include a fuller account of that strange and most interesting development of photography which is going on even while we write, and this is so new and so important that we must try to give some hint of it even in this brief summary, for even since the first numbers of this series were written, great advances have taken place in its application to celestial objects.

Most of us have vague ideas about small portions of time; so much so, that it is rather surprising to find to how many intelligent people a second, as seen on the clock face, is its least conceivable interval. Yet a second has not only a beginning, middle, and end, as much as a year has, but can, in thought, at least, be divided into just as many numbered parts as a year can. Without entering on a disquisition about this, let us try to show by some familiar thing that we can, at any rate, not only divide a second in imagination into, let us say, a hundred parts, but that we can observe distinctly what is happening in such a short time, and make a picture of it—a picture which shall be begun and completed while this hundredth of a second lasts.

Every one has fallen through at least some such a little distance as comes in jumping from a chair to the floor, and most of us, it is safe to say, have a familiar impression of the fact that it takes, at any rate, less than a second in such a case from the time the foot leaves its first support till it touches the ground. Plainly, however large or small the fall may be, each fraction of an inch of it must be passed through in succession, and if we suppose the space to be divided, for instance, into a hundred parts, we must divide in thought the second into at least as many, since each little successive space was traversed in its own little interval of time, and the whole together did not make a second. We can even, as a matter of fact, very easily calculate the time that it will take anything which has already fallen, let us say, one foot to fall an inch more; and we find this in the supposed instance to be almost exactly one one-hundredth of a second. On page 588 is a reproduction of a photograph from nature of a man falling freely through the air. He has dropped from the grasp of the man above him, and has already fallen through some small distance—a foot or so. If we suppose it to be a foot, since we can see that the man's features are not blurred, as they

would undoubtedly have been had he moved even much less than an inch while this picture was being taken, it follows from what has been said, that the taking of the whole picture—landscape, spectators, and all—occupied not *over* one one-hundredth of a second.

We have given this view of the falling man because rightly understood it thus carries internal evidence of the limit of time in which it could have been made; and this will serve as an introduction to another picture where probably no one will dispute that the time was still shorter, but where we cannot give the same kind of evidence of the fact.

“Quick as lightning” is our common simile for anything occupying, to ordinary sense, no time at all. Exact measurements show that the electric spark does occupy a time, which is almost inconceivably small, and of which we can only say here that the one one-hundredth of a second we have just been considering is a long period by comparison with the duration of the brightest portion of the light.

On page 589 we have the photograph of a flash of lightning (which proves to be several simultaneous flashes) taken last July from a point on the Connecticut coast, and showing not only the vivid zigzag streaks of the lightning itself, but something of the distant sea view, and the masts of the coast survey schooner *Palinurus* in the foreground, relieved against the sky. We are here concerned with this interesting autograph of the lightning only as an illustration of our subject and as proving the almost infinite sensitiveness of the recent photographic processes, for there seems to be no limit to the briefness of time in which these can so act in some degree, whether the light be bright or faint, and no known limit to the briefness of time required for them to act *effectively* if the light be bright enough.

What has just preceded will now help us to understand how it is that photography also succeeds so well in the incomparably fainter objects we are about to consider and which have been produced not by short but by long exposures. We have just seen how sensitive the modern plate is, and we are next to notice a new and very important point in which photographic action in general differs remarkably from that of the eye. Seeing may be described, not wholly inaptly, as the recognition of a series of brief successive photographs, taken by the optic lens on the retina, but the important difference between seeing and photographing which we now ask attention to is this: When the eye looks at a faint object, such as the spectrum of a star or at the still fainter nebula, this, as we know, appears no brighter at the end of half an hour

than at the end of the first half-second. In other words, after a brief fraction of a second, the visual effect does not sensibly accumulate. But in the action of the photograph, on the contrary, the effect *does* accumulate, and in the case of a weak light accumulates indefinitely. It is owing to this precious property, that supposing (for illustration merely) the lightning flash to have occupied the one-thousandth part of a second in impressing itself on the plate: to get a nearly similar effect from a continuous light one thousand times weaker, we have only to expose it a thousand times as long, that is, for one second, while from a light a million times weaker, we should get the same result by exposing it a million times as long, that is, for a thousand seconds.

And now that we come to the stars, whose spectra occupy minutes in taking, what we just considered will help us to understand how we can advantageously thus pass from a thousandth of a second or less to one thousand seconds or even more, and how we can even,—given time enough,—conceivably, be able to photograph what the eye *cannot see at all*.

We have on page 590 a photograph quite recently taken at Cambridge from a group of stars (the Pleiades) passing by the telescope. Every star is caught as it goes, and presented, not in its ordinary appearance to the eye, but by its spectrum. There is a general resemblance in these spectra from the same cluster; while in other cases the spectra are of all types and kinds, the essential distinction between individuals alike to the eye being more strikingly shown, as stars apparently far away from one another are seen to have a common nature, and stars looking close together (but which may be merely in line, and really far apart) have often no resemblance; and so the whole procession passes through the field of view, each individual leaving its own description. This self-description will be better seen in the remarkable photographs of the spectra of Vega and Aldebaran which are reproduced on page 591 from the originals by a process independent of the graver. They were obtained on the night of November 9th, 1886, at Cambridge, as a part of the work pursued by Professor Pickering, with means which have been given from fitting hands thus to form a memorial of the late Dr. Henry Draper. We are obliged to the source indicated, then, for the ability to show the reader here the latest, and as yet unedited, results in this direction, and they are such as fully to justify the remark made above, that minutes by this new process take the place of years of work by the most skillful astronomer's eye and hand.

The spectrum of Vega (Alpha Lyræ) is marked only by a few strong lines, due chiefly

to hydrogen, because these are all there are to be seen in a star of its class. Aldebaran (the bright star in Taurus), on the contrary, here announces itself as belonging to the family of our own sun, a probably later type, and distinguished by solar-like lines in its spectrum, which may be counted in the original photograph to the number of over two hundred. There is necessarily some loss in the printed reproduction, but is it not a wonderful thing to be able to look up, as the reader may do this February night, to Aldebaran in the western sky, and then down upon the page before us, knowing that that remote, trembling speck of light has by one of the latest developments of the New Astronomy been made, without the intervention of the graver's hand, to write its own autograph record on a page of *THE CENTURY* before him?

In the department of nebular astronomy, photography has worked an equal change. The writer well remembers the weeks he has himself spent in drawing or attempting to draw nebulae; things often so ghost-like as to disappear from view every time the eye turned from the white paper, and only to be seen again when it had recovered its sensitiveness by gazing into the darkness. The labors of weeks were literally only represented by what looked like a stain on the paper, and no two observers, however careful, could be sure that the change between two drawings of a nebula at different dates was due to an alteration in the thing itself, or in the eye or hand of the observer, though unfortunately for the same reason it is impossible fully to render the nebulous effect of the photograph in engraving. We cannot with our best efforts do, then, full justice to the admirable one of Orion on page 592 which we owe to the particular kindness of Mr. Common, of Ealing, England, whose work in this field is as yet unequalled. The original enlargement measures nearly two square feet in area, with fine definition. It is taken by thirty-nine minutes' exposure, and its character can only be indicated here, for it is not too much to say here, too, of this original, that as many years of the life of the most skilled artist could not produce so trustworthy a record of this wonder.

The writer remembers the interest with which he heard Dr. Draper, not long before his lamented death, speak of the almost incredible sensitiveness of these most recent photographic processes, and his belief that we were fast approaching the time when we should photograph what we could not even see. That time has now arrived. At Cambridge, in Massachusetts, and at the Paris Observatory, by taking advantage of the cumulative action we have referred to, and by long exposures, photo-

graphs have recently been taken showing stars absolutely invisible to the telescope, and enabling us to discover faint nebulae whose previous existence had not been suspected; and when we consider that an hour's exposure of a plate now not only secures a fuller star-chart than years of an astronomer's labor, but a more exact one; that the art is every month advancing perceptibly over the last, and that it is already, as we may say, not only making pictures of what we see, but of what we cannot see, even with the telescope,—we have before us a prospect whose possibilities no further words are needed to suggest.

We have now not described, but only mentioned, some division of the labors of the New Astronomy in its photometric, spectroscopic, and photographic stellar researches, on each of which as many books, rather than chapters, might be written, to give only what is novel and of current interest. But these are themselves but a part of the modern work that has overturned or modified almost every conception about the stellar universe which was familiar to the last generation, or which perhaps we were taught in our own youth.

IN considering the results to be drawn from this glance we have taken at some facts of modern observation, if it be asked, not only what the facts are, but what lessons the facts themselves have to teach, there is more than one answer, for the moral of a story depends on the one who draws it, and we may look on our story of the heavens from the point of view either of our own importance or of our own insignificance. In the one case, we behold the universe as a sort of reflex of our own selves, mirroring in vast proportions of time and space our own destiny; and even from this standpoint, one of the lessons of our subject is surely that there is no permanence in any created thing. When primitive man learned that with lapsing years the oak withered and the very rock decayed, more slowly but as surely as himself, he looked up to the stars as the very types of contrast to the change he shared, and fondly deemed them eternal; but now we have found change there, and that probably the star clusters and the nebulae, even if clouds of suns and worlds, are fixed only by comparison with our own brief years, and, tried by the terms of their own long existence, are fleeting like ourselves.

"We have often witnessed the formation of a cloud in a serene sky. A hazy point barely perceptible—a little wreath of mist increases in volume and becomes darker and denser, until it obscures a large portion of the heavens. It throws itself into fantastic shapes, it gathers a glory from the sun, is borne onward by

the wind, and as it gradually came, so, perhaps, it gradually disappears, melting away in the untroubled air. But the universe is nothing more than such a cloud—a cloud of suns and worlds. Supremely grand though it may seem to us, to the infinite and eternal intellect it is no more than a fleeting mist. If there be a succession of worlds in infinite space, there is also a succession of worlds in infinite time. As one after another cloud replaces clouds in the skies, so this starry system, the universe, is the successor of countless others that have preceded it—the predecessor of countless others that will follow."

These impressions are strengthened rather than weakened when we come back from the outer universe to our own little solar system, for every process which we know tends to the dissipation, or rather the degradation, of heat, and seems to point, in our present knowledge, to the final decay and extinction of the light of the world. In the words of one of the most eminent living students of our subject, "The candle of the sun is burning down, and, as far as we can see, must at last reach the socket. Then will begin a total eclipse which will have no end."

Yet though it may well be that the fact itself here is true, it is possible that we draw the moral to it, unawares, from an unacknowledged satisfaction in the idea of the vastness of the funeral pyre provided for such beings as ourselves, and that it is pride, after all, which suggests the thought that when the sun of the human race sets, the universe will be left tenantless as a body from which the soul has fled. Can we not bring ourselves to admit that there may be something higher than man and more enduring than frail humanity in some sphere in which *our* universe, conditioned as it is, in space and time, is itself embraced, and so distrust the conclusions of man's reason where they seem to flatter his pride?

May we not receive even the teachings of science, as to the laws of nature, with the constant memory that all we know even from science itself depends on our very limited sensations, our very limited experience, and our still more limited power of conceiving anything for which this experience has not prepared us?

I HAVE read somewhere a story about a race of ephemeral insects who live but an hour. To those who are born in the early morning the sunrise is the time of youth. They die of old age while his beams are yet gathering force, and only their descendants live on to midday; while it is another race which sees the sun decline, from that which saw him rise. Imagine the sun about to set, and the whole nation of mites gathered under the shadow of some

mushroom (to them ancient as the sun itself) to hear what their wisest philosopher has to say of the gloomy prospect. If I remember aright, he first told them that, incredible as it might seem, there was not only a time in the world's youth when the mushroom itself was young, but that the sun in those early ages was in the eastern, not in the western, sky. Since then, he explained, the eyes of scientific ephemera had followed it, and established by induction

from vast experience the great law of nature, that it moved only westward; and he showed that since it was now nearing the western horizon, science herself pointed to the conclusion that it was about to disappear forever, together with the great race of ephemera for whom it was created.

What his hearers thought of this discourse I do not remember, but I have heard that the sun rose again the next morning.

S. P. Langley.

RECENT DISCOVERIES OF WORKS OF ART IN ROME.

BY THE DIRECTOR OF THE NEW MUSEO URBANO.

IN a manuscript volume of the Vatican Library, belonging to the Syriac collection, and numbered one hundred and forty-five, a short description of Rome has been found, written A. D. 546, by Zacharias, a Byzantine historian and bishop of Mitylene in the island of Lesbos. From his account we gather that, towards the middle of the sixth century of our era, there were in Rome *eighty* statues of gilt bronze representing gods, *three thousand seven hundred and eighty-five* bronze statues of miscellaneous subjects, and *twenty-five* bronze statues which according to the tradition had been removed from Jerusalem by Vespasian; in total, three thousand eight hundred and ninety works of art in bronze, exhibited in public places. Of this immense and invaluable collection a particle only has come down to us; in fact, the list of antique bronzes in modern Rome is so short that, as regards number, the contents of our museums cannot be compared favorably with the contents of the National Museum in Naples. Our list comprises, first of all, the Capitoline collection, namely, the "Bronze Wolf," the equestrian statue of M. Aurelius, the colossal head of Domitian, the "Camillus" or sacrificing youth, the "Boy Extracting a Thorn," and the "Hercules" from the Forum Boarium. Many errors connected with the origin and the discovery of these famous bronzes have been circulated, and are still believed by many. The equestrian statue is said to have been found between the Lateran and the basilica of S. Croce in Gerusalemme, in a vineyard adjoining the "Scala Santa"; the "She-wolf," to have been found under the N. W. spur of the Palatine hill, near the so-called "Arco degli argentieri" at S. Giorgio in Velabro; the colossal head of Domitian, to have been found in 1487 near the basilica of Constantine on the

"Sacra Via," and so on. The truth is that these celebrated works have *never* been lost and rediscovered; and that, from the fall of the empire downwards, they have been kept together and preserved in and around the Pope's palace at the Lateran, until Sixtus IV. and Paul III. caused them to be removed to the Capitol.

Of the equestrian statue of M. Aurelius we have accounts since the tenth century. In the year 966, Peter, prefect of Rome, was executed for rebellion against Pope John XIII., being hung by the hair from this horse; and at its feet was flung the corpse of the Antipope Boniface, son of Ferruccio, in the year 974. We hear again of the group in 1347, during the festivities which followed the election of Rienzi to the tribuneship, when, for nearly a whole day, wine was made to flow from one nostril of the horse, water from the other. This constant connection of the equestrian group with the Lateran, from immemorial time, makes us believe that it was never removed thither from the Forum, as commonly asserted, but that it must have belonged to the Lateran imperial residence since the time of Marcus Aurelius, who was born and educated in the house of the Annii close by.

As regards the "She-wolf," the positive evidence of its being kept at the Lateran dates from the beginning of the ninth century. Benedict, a monk from Mount Soracte who wrote a "Chronicon" in the tenth century, speaks of the institution of a supreme court of justice "in the Lateran palace, in the place called *the Wolf*, viz., the mother of the Romans." Trials and executions "at the Wolf" are recorded from time to time until 1450. Paolo di Liello speaks of two highwaymen, whose hands, cut by the executioner, were hung at the Wolf. It was removed to the Conservatori palace on the Capitol in 1473, together with the colossal head, and the "Camillus."

The antique bronzes in the Vatican Museum

are less important in number and in interest than those of the Capitol; in fact, two only are worth mentioning: the "Pine-cone" in the "Giardino della Pigna," and the "Hercules," discovered in the autumn of 1864 under the foundations of the Palazzo Pio di Carpi, on the site of the theater of Pompey the Great.

The "Pine-cone," eleven feet high, is generally described as the pinnacle of Hadrian's mausoleum (now Castel Sant'Angelo), in the ruins of which it is said to have been found. The truth is that the "Pine-cone" has always been the central ornament of a large fountain, or basin, or pond, the water flowing in innumerable jets, *per foramina nucum*, that is to say, from each of the spikes. Pope Damasus, who did so much towards the embellishment of sacred edifices in Rome (between 366 and 384), removed the "Pine-cone" from its antique place, most probably from Agrippa's artificial lake in the Campus Martius, and adorned with it the magnificent fountain which he had built in the center of the so-called "Paradise" of St. Peter's, namely, in the center of the square portico in front of the basilica.

The other bronze of the Vatican, the colossal "Hercules" discovered twenty-two years ago near the Piazza di Campo dei Fiori, under the substructions of Pompey's theater, is remarkable more for having been an oracular statue than for its beauty. Very few persons are acquainted with the most striking feature of this Hercules. I mean very few persons know the existence of a hole on the back of the head, thirty-eight centimeters in diameter, through which a full-grown youth can easily penetrate into the colossus. The experience was actually made by a young mason named Pietro Roega, in November, 1864, in the presence of Commendatore Tenerani and other eminent personages; and the sound of his voice, in answering the questions addressed to him, was really impressive and almost supernatural. Hercules, like Æsculapius, Apollo, and the Fortune, was undoubtedly an oracular god, as shown by the existence of many temples and sanctuaries in which *responsa* or oracles were given in his name.

How happens it that so very few among the many thousand bronze statues of antique Rome have escaped destruction? The answer has already been given by Fea in his "Istoria della rovina di Roma," by Gibbon in his "Decline and Fall of the Roman Empire," by Dyer in the last chapters of his "History of the City of Rome." During the long agony of the former capital of the world, an agony which lasted nearly seven centuries, from Constantine's age to the final burning of the city by Robert Guiscard and his Normans, in May, 1084, no one, except a few lime-burners, paid any attention

to marbles; bronze and other metals were searched, spied, stolen, stripped, and melted with an almost incredible amount of labor and patience, on account of their marketable value and facility of transportation. In justice to the barbarians, upon whom is often cast the blame of spoliation committed by the Romans, we must acknowledge that the emperors themselves set the bad example of stealing bronze and other valuables from public places, especially from pagan temples and shrines, after the recognition of Christianity as the religion of the State. The first inroad upon this class of works of art was undoubtedly made by Constantine in transferring the seat of the empire to Byzantium; at any rate, under him began the wanton practice of changing the heads of bronze and marble statues, in order that they might be dedicated to new personages with no cost and no trouble.

The next important step towards the destruction of the artistic treasures of Rome was made in 383 by Gratianus, when he ordered, by imperial decree, the abolition and confiscation of the privileges and the patrimony of all pagan places of worship, on the ground that it was not becoming a Christian government and a Christian state to supply the infidels with the means of persevering in their errors. In 391 the edict of Gratianus was confirmed by his brother Valentinian II., and this measure having roused the indignation of the pagan majority in the Senate-house, ready to break into an open rebellion, the emperor decided to strike the final blow, and before that memorable year was over another decree prohibited forever superstitious sacrifices in Rome and in Italy, even if offered under a private name, at private cost, and within the threshold of a private house. The masterpieces of Grecian and Italo-Greek art, to which divine honors had been offered for centuries, were removed from their temples and exhibited in public places, in the baths, in the forums, in the theaters, as simple objects of curiosity. There is no doubt, however, that on this occasion, and on their being suddenly exposed to the hatred and violence of a Christian populace, who had so long and so bitterly suffered from the hatred and violence of the pagan aristocracy, the works of art must have suffered a certain amount of damage. The bronze "Hercules" of the Vatican, for instance, bears still the evidence of an ignoble attack, which must have taken place when the gates of the temple were shut behind him.

In 408 Alaric was induced to withdraw from Rome, on the payment of an exorbitant ransom, one of the items of which was five thousand pounds in weight of gold. In order to meet such a demand, the Romans were

compelled to strip the bronze statues of their heavy gilding. Two years later, on the 24th day of August, 410, Alaric and his hordes stormed the town, plundered it for three consecutive days, carrying off an incredible amount of articles of value.

In June, 455, the Vandals, with whom were mixed Bedouins and Africans, entered Rome by the Porta Portese, and plundered it at leisure during a whole fortnight. On this occasion the palace of the Cæsars was completely robbed, not only of its precious statues, but even of its commonest brass utensils. Genseric seems to have particularly devoted himself to the plunder of the temple of Jupiter Capitolinus; its statues were carried off to adorn the African residence of the Vandal king, and half the roof was stripped of its tiles of gilt bronze.

On the first of January of the following year, 456, the Senate decreed that a bronze statue should be raised in Trajan's forum in honor of Sidonius Apollinaris, the son-in-law of the emperor Avitus. Although the decree of the Senate must be understood in the sense that a new head, representing within a certain approximation the likeness of Apollinaris, should be put on a preëxisting statue, still the fact proves that in spite of so many inroads and plunders, works in metal were still left in Rome, not only in private palaces and villas, but also in public palaces such as the forum of Trajan.

It does not enter into the scheme of this paper to follow any longer, chapter by chapter, the history of the destruction of Rome. Two incidents only remain to be noted: first, the erection of a monumental column in honor of Phocas, the usurper of the throne of the East and the murderer of Mauritius, because, from the inscription engraved on the pedestal, we learn that the column itself was crowned with a statue *in gilt bronze*. A statue in gilt bronze could not have been modeled and cast in Rome in 608; it was merely a statue cast centuries before, to which, I am inclined to believe, not even the head had been changed. The second incident worth note is the grant from the emperor Heraclius to Pope Honorius I., of the gilt bronze tiles forming the roof of Hadrian's temple of Venus and Rome. The tile grant had been requested in favor of the basilica of St. Peter: a consequence of it was the destruction of Hadrian's masterpiece.

At length, in 663, Rome had, for the last time, the misfortune of an imperial visit. Constans II., compelled by the guilty conscience of a fratricide to wander from sanctuary to sanctuary, undertook the pilgrimage to Rome, in the spring of that year, and was met by Pope Vitalianus and the few inhab-

itants near the sixth milestone of the Appian Way. The short and friendly visit of this Christian emperor proved absolutely fatal; he laid his hands on everything which, after the repeated sieges of the Vandals, Goths, and Lombards, had been left for plunder. "In the twelve days which Constans spent at Rome, he carried off as many bronze statues as he could lay hands on; and though the Pantheon seemed to possess a double claim to protection, as having been presented by Phocas to the Pope, and as having been converted into a Christian church, yet Constans was mean and sacrilegious enough to carry off the tiles of gilt bronze which covered it. After perpetrating these acts, which were, at least, as bad as robberies, and attending mass at the tomb of St. Peter, Constans carried off his booty to Syracuse. His plunder ultimately fell into the hands of the Saracens" (Dyer: p. 356).

A remarkably interesting discovery has been made of late in connection with this visit of Constans to Rome. It is certain that the emperor, between his acts of doubtful devotion in churches and basilicas, found time enough to visit the pagan monuments and ruins. These visits were recorded by one of his attendants by scraping the name of the emperor on the most prominent place of each building which the party would dishonor with its presence. Here is the fac-simile of the record scratched on the "Janus quadrifrons" on the Forum Boarium.

ΚΩΝΣΤΑΝΤΙΝΟΣ ΕΔΕΚΕΝΙΝΟC

Another signature has been discovered and read on the very top of Trajan's column. I have no doubt that a careful examination of the principal Roman monuments, of the Coliseum, for instance, of the Pantheon, of the Antonine column, etc., would lead to the discovery of other such "graffiti," and would enable us to follow step by step the wanderings of the last emperor who saw Rome before its last destruction by the Normans.

After such a marvelous succession of robberies and spoliation, there is no reason to wonder at the scarcity of antique bronzes in Rome; in fact there is reason to wonder at the chance by which the few we possess have come down to us. The explanation of the mystery is this: *Every bronze discovered in Rome since the Renaissance* (I speak of this later period, because our knowledge of earlier finds is too imperfect and fragmentary to be valued) *had been carefully concealed and hidden*, evidently under the apprehension of a great and imminent danger. The secret of the hiding-place was never revealed, either on account of the murder or of the death of those who knew it,

or else on account of the destruction of the building under which the treasure had been buried. To quote only discoveries which have taken place in my life-time, I will mention first of all the treasure-trove of the "Vicolo delle Palme" in the Trastevere. In 1849, a few weeks before the storming of Rome by the French army of General Oudinot, under the house No. 17 in the above-mentioned lane, a most remarkable collection of works of art was discovered by mere accident. It comprised the "Apoxymenos" of Lysippus, now in the Braccio nuovo (a marble copy from the bronze original, which stood in front of the baths of Agrippa); the bronze horse, now in the Palazzo de' Conservatore, described by Emil Braun as "an unique work, a masterpiece, and a genuine Grecian antique"; a bronze foot, with an extremely ornamented shoe, which may possibly have belonged to the rider of the horse; a bronze bull, and many other fragments of less importance. Here we have the evidence of a collection of works in metal, stolen from different places, and concealed in that remote corner of the Trastevere, in readiness for shipment from the quay of the Tiber close by. Whether the deed was committed by a barbarian from the hordes of Genseric, who entered and left Rome precisely from this quarter, or by a Jew of the Transtiberine community, the fact is that the treasure was never removed from its hiding-place until its accidental discovery in 1849.

The Vatican "Hercules" above described, and discovered on August 8th, 1864, under the substructions of Pompey's theater,

VOL. XXXIII.—77.

STANDING ATHLETE, DISCOVERED FEBRUARY, 1885.

SITTING ATHLETE, AS DISCOVERED.

had been not only concealed, but actually buried with utmost care in a kind of coffin built of solid masonry and coated with marble.

In 1881, when the foundations of the English chapel were first laid at the corner of the Via del Babuino and the Via del Gesu-Maria, a collection of bronze imperial busts was found heaped up and concealed in a subterranean passage. The same thing had happened two years before at the corner of the Via Nazionale and the Via di St. Eufemia, when a remarkable set of bronzes was found by Madame Ristori concealed under the foundations of her palace. The discovery of the two magnificent athletic statues, which forms the subject of this paper, has taken place under circumstances absolutely identical, as I shall presently relate.

In the spring of 1884 an application was made to the government and to the municipality of Rome for the constitution of a "national dramatic society," and for the grant of a plot of ground, upon which the society's theater could be built. Both requests having been accepted by the State and the town authorities, the society took possession of a beautiful plot of ground, on the western slope of the Quirinal hill, between the Colonna gardens and the Palazzo Campanari, on the condition that whatever should be found in clearing

the site should become the property of the State. The work of excavation had not even begun, when I received a letter from an old digger of antiquities, warning me to watch carefully the building of the new theater, on account of some rare bronzes which he thought were buried there at a great depth. The surmise was not based on any real knowledge; the plot of ground had never been excavated or explored before, and no human being could tell what would be the chances and the results of such an excavation. Strange to say, the prophecy of my humble correspondent, Signor Guiseppe Gagliardi, proved to be correct beyond expectation; the two bronze statues discovered there in March and April, 1885, must be classed among the finest masterpieces ever brought to light from the Roman soil.

The slope of the Quirinal hill, upon which the society is building, was occupied in ancient times by three different edifices: by the temple which the Emperor Aurelian dedicated to the Sun, A.D. 273, after his victories in the East; by the shrine dedicated to Semo Sancus, an archaic, little-known Sabine god; and lastly, by a portico built under Constantine, and known in topographical books as the "porticus Constantini." Still the limits of these three buildings were so imperfectly known, that we

could not tell how large a portion of each would be discovered in clearing the site for the new theater. The result of the excavations has shown that the lower portion of the ground was occupied by a private house of a modest appearance, the existence of which was altogether unknown; the upper portion was occupied by the towering substructions of the temple of the Sun.

On Saturday, February 7th, 1885, toward sunset, a workman engaged in clearing the rubbish which filled up the space between the first and the second substruction wall of the temple (at the south-west corner of the platform) discovered the fore-arm of a bronze statue lying on its back at a depth of seventeen feet below the level of the platform itself. The news was kept secret by the contractor of the works until the following day; and when the government officials met on the spot, the statue had been already removed from its place of concealment, and consequently we were not able to study and take notice of the circumstances of the find, which circumstances, however minute and uninteresting they appear at first sight, may sometimes throw an unexpected light on problems otherwise very hard to deal with.

This noble figure is seven feet four inches high, two feet wide at the shoulders, and represents a naked athlete, or at least a man of the athletic type, in the full development of his strength, whose features are evidently modeled from nature—in other words, it is a portrait statue. Some adepts of that modern archaeological school which pretends to be able to identify everything, have started up the idea that the statue may represent one of the Macedonian kings,—I don't recollect exactly which,—but there seems to be hardly any foundation for such a statement. The figure stands and rests on the right leg, the left being extended a little forward. The right arm is bent behind the back and rests on the haunches, as is the case with the Vatican Meleager and the Hercules of Glycon. The left arm is raised high above the head and was supported by a rod or a lance, the traces of which are to be seen all along the fore-arm. On the breast of the figure the letters

L · VIS · L · XXIIX

have been engraved at a very late period, that is to say, many years, centuries perhaps, after the removal of the statue from Greece to Rome. These letters have given rise to much

speculation. They have even been read and explained as follows, *L(ucius) VIS(ullius) L(uctavit) XXIIX*: "Lucius Visullius has fought in the arena twenty-eight times!" I need not dwell on such absurdities, the truth being that nobody, not even the great Mommson, has been able to give a satisfactory explanation of those mysterious signs.

The excitement created by this extraordinary find had scarcely abated, when, about a month later, a second bronze statue was dug up, under the same circumstances as related above. The discovery took place between the second and the third foundation wall, at a depth of eighteen feet below the level of the platform. Being warned at once, we assembled this time on the spot when only the head of the figure was coming out of the ground, and consequently we could watch and follow and ascertain the minutest details of the find.

The most important piece of evidence collected, in witnessing and following the removal of the earth in which the masterpiece lay buried, is that the statue had not been thrown there disorderly, or buried in haste, but that it had been concealed and treated with utmost care. The figure, being in a sitting posture, had been placed on a stone capital of the doric order, as upon a stool, and the trench, which had been opened through the lower foundations of the temple of the Sun to conceal the statue, had been filled with sifted pure earth, in order to save the surface of the bronze from any possible injury.

I have witnessed in my long career on the active field of archæology many discoveries,* but I have never felt such an extraordinary impression as the one created by the sight of this magnificent specimen of a semi-barbaric athlete coming slowly out of the ground, as if awakening from a long repose after his gallant fights.

His torso bends gently forward; his elbows rest on the knees; his attitude is the attitude of a boxer (wrestler, pugilist, pankratiastes) exhausted by the numerous blows received, the traces of which are visible all over his body. The face, of Herculean type, is turned towards the right, the mouth is half open, the lips seem to quiver, as if speaking to some one,—in fact, there is no doubt that the statue belongs to a group. Every detail is absolutely realistic: the nose is swollen from the effects of the last blow received; the ears resemble a flat and shapeless piece of leather; the neck, the shoulders, the breast, are seamed with scars. The

* To convey an idea of the riches which our Roman soil is capable of yielding, in spite of so many centuries of uninterrupted excavations, I quote from the municipal statistics. From January 1st, 1872, to December 31st, 1885, the following works of art and objects have been

found in building the new quarters: 192 marble statues, 266 busts and heads, 152 bas-reliefs, 390 columns, 2360 lamps, 4024 inscriptions, 405 bronzes, 711 cameos, intaglios, and precious stones, 47 objects in gold, 39 objects in silver, 36,679 coins in gold, silver and bronze, etc.

SITTING ATHLETE, AS SEEN IN THE MUSEUM.

modeling of the muscles of the arms and of the back is simply wonderful. The gallant champion is panting from sheer fatigue, but he is ready to start up again at the first call. The details of the fur-lined boxing-gloves are also interesting, and one wonders how any human being, no matter how strong and powerful, could stand the blows from such engines as these gloves, made of four or five thicknesses of leather, and fortified with brass buckles.

This bronze was considered at first to belong to the best period of Græco-Roman sculpture; the majority of connoisseurs and archæologists are now in favor of a purely Greek origin. This latter opinion, to which I fully subscribe, is confirmed to a certain degree by a circumstance which loses none of its importance because it is minute. Under the middle toe of the left foot I have traced the existence of a letter, of a big A, which

letter has not been engraved after the casting (as is the case with the signs on the breast of the standing athlete), but cast at the same time with the figure. The letter is not a Latin A, but a Greek Αλφα, and of a rather archaic shape, its height and width being absolutely the same. The minute circumstance proves, if I am not mistaken, that the work was not cast in Rome, but in Greece, and cast at a comparatively early period.

As regards the building in which the two statues were exhibited in Rome, and from which they were removed under the apprehension of danger, to be buried so carefully and at such a depth, I have no doubt it was the Baths of Constantine, separated from the temple of the Sun by a narrow street. Athletic statues were the special ornament of Roman *thermæ*, and those of Constantine must have possessed their share of this class of works in metal and marble. I have no doubt that many more statues may be found if a proper search is made under the substructions of the temple; the work however is difficult, costly, and not exempt from danger, on account of the modern buildings under which the exploration ought to be extended.

The third bronze statue, a Bacchus, discovered in Rome in the spring of 1885, comes from the bed of the Tiber, from that mighty reservoir of antiquities which seems to be inexhaustible. It was found in making the foundations of the middle pier for the new bridge (Ponte Garibaldi alla Regola) which spans the river between the Ponte Sisto and the island of St. Bartolomeo.

The statue lay in almost a perpendicular position, head downwards, sixteen feet below the bottom of the river, and twenty-six below the surface of the water. The merry god is represented in the full bloom of youth, and has a decidedly feminine type, especially as re-

gards the arrangement of the long curling hair, which is parted in the middle and fastened with a band on the forehead. The band is gracefully inlaid with copper and silver; the eyeballs are made of a soft yellowish stone called "palombino."

This Bacchus, compared with the two superb masterpieces from Constantine's baths, seems altogether too tame, and need not be described at length. It is, at any rate, Græco-Roman work of the first century of the Christian era, a fact proved, first, by the stiffness and, as we Italians say, by the "maniera" or "conventionality" of the attitude and of the outline of the figure; secondly, by the impression of a coin on the calf of the left leg. Our best numismatists think that this coin must have been an imperial gold piece, probably of the time of Nero.

The lower portion of the body has evidently suffered from the effects of fire, but under what circumstances, by whom, at what period, this valuable work of art was hurled into mid-stream, it is impossible to determine. Its discovery, at any rate, affords us a compensation for the many losses which the gigantic work of the embankment of the river makes us suffer. One of those losses, the greatest perhaps of all, is the destruction, or, to speak more exactly, the deformation, of the antique bridge connecting the island of St. Bartolomeo with the Trastevere, to which bridge two modern arches will be added on each side, as the bed of the Tiber must be widened there. The bridge was built twenty-one centuries ago by Lucius Cestius, and restored A. D. 380 by the Emperor Gratianus with blocks of travertine stolen from the theater of Marcellus close by, a circumstance which shows to what degree of poverty and humiliation Rome, the queen of the world, had descended at the end of the fourth century of the Christian era.

Rodolfo Lanciani.

THE RIVER OF REST.

A BEAUTIFUL stream is the River of Rest;
The still, wide waters sweep clear and cold,
A tall mast crosses a star in the west,
A white sail gleams in the west world's gold:
It leans to the shore of the River of Rest —
The lily-lined shore of the River of Rest.

The boatman rises, he reaches a hand,
He knows you well, he will steer you true,
And far, so far from all ills upon land,
From hates, from fates that pursue and pursue;
Far over the lily-lined River of Rest —
Dear mystical, magical River of Rest.

A storied, sweet stream is this River of Rest;
The souls of all time keep its ultimate shore;
And journey you east, or journey you west,
Unwilling, or willing, sure-footed, or sore,
You surely will come to this River of Rest —
This beautiful, beautiful River of Rest.

Joaquin Miller.

S'PHIRY ANN.

POLLY.

THE Standneges lived in a little sheltered cove upon the mountain-side, their house only a two-roomed cabin, with an entry separating the rooms, and low, ungainly chimneys at each end. Below it the Cartecay River lay like an amber ribbon in the green, fertile valley; above it towered majestic mountain heights, shrouded in silver mists or veiled in a blue haze. The Standneges were bred-and-born mountaineers, and had drifted into the little cove while Indian camp-fires were still glowing like stars in the valley of the Cartecay and Indian wigwams dotting the river's banks. The house had a weather-beaten look, and the noble chestnut oaks shading it had covered the roof with a fine green mold.

The kitchen, a heavy-looking, smoke-blackened structure with a puncheon floor, stood just in the rear of the house, and so situated that from the door one could look through the entry to the front gate and the mountain road beyond.

Mrs. Standnege sat in the kitchen door one morning with bottles and bean-bags scattered around her, "sortin'" out seed-beans. She was

a woman not much beyond middle age, but lean and yellow, with faded eyes and scant dun-colored hair, time and toil and diet having robbed her of the last remnant of youth, without giving her a lovely old age. She was a good type of the average mountain woman, illiterate but independent, and contented with her scant homespun dress, her house, her bean-bags.

A heavy old loom occupied one corner of the kitchen, and Polly, the eldest daughter, sat on the high bench before it, industriously weaving, while S'phiry Ann stood by the smoke-stained mantel, watching the pine she had laid on the fire burst into vivid flame. A bundle of clothes lay at her feet, surmounted by a round flat gourd, filled with brown jelly-like soap.

Polly was the eldest and she the youngest of eight children, but the others all lay safely and peacefully in the little neglected burial-ground at the foot of the mountain. She was unlike mother and sister. She had youth, she was supple and fair, her hair dark and abundant, her eyes gray and clear. She had the soft, drawling voice, but also a full share of the sturdy independence, of her race. The circumstances of her christening Mrs. Standnege was rather fond of relating.

"Yes, S'phiry Ann is er uncommon name,"

MRS. STANDNEGE.

she would say, not without a touch of complacency, "but her pap gin it tu her. She was a month old to a day, when that travelin' preacher came through here an' held meetin' fer brother Dan'l on Sunday. He preached mos'ly about them liars droppin' dead at the 'postles' feet, an' Standnege came home all but persessed about it, an' nothin' ed do but he mus' name the baby S'phiry Ann instead er Sarry Ann as we'uns had thought. He 'lowed it sarved them onprincipled folks right to die, an' he wanted somethin' ter remin' him o' that sermont. Well, I ain't desputin' but it was right, but I tole Standnege then, an' I say so yit, that ef all the liars in the world war tuk outen it, thar wouldn't be many folks left."

S'phiry Ann had heard of the fate of the Sapphira figuring in sacred history; it had been deeply impressed on her mind in her tenderest years, and might possibly have left a deep impression, for she grew up a singularly truthful, upright girl. Just now, as she leaned against the mantel and stared at the fire, her face wore an unwontedly grave expression.

"Folks as set themselves up ter be better'n they ekals air mighty apt tu git tuk down, S'phiry Ann," said her mother, evidently resuming a conversation dropped a short time before.

"But I ain't a-settin' up ter be better'n my ekals, ma," said S'phiry Ann, gently but defensively.

"It 'peared like nothin' else yiste'day when you'uns so p'intedly walked away from Gabe Plummer at meetin', an' it the fust time you'uns had seed him since comin' from yer aunt Thomas over in Boondtown settlemint. Thar ain't no call ter treat Gabe so."

"But ain't we hearn he's tuk up with them distillers on the mountains?" said the girl in a low tone, a deep flush overspreading her face.

"Yes, we'uns hev hearn it, but what o' that? Many a gal has tuk jes' sech."

"An' glad to get 'em too," snapped Polly sharply, stopping to tie up a broken thread.

"Gabe Plummer is er uncommon stedd boy. He's er master hand at en'thing he wants ter do, an' —"

But S'phiry Ann did not linger to hear the full enumeration of her lover's virtues. Hastily balancing the bundle of clothes on her head, she took up the blazing torch, and hurried to the spring, a crystal-clear stream, running out of a ledge of rock, and slipping away through a dark ravine to the river. If she imagined she had escaped all reproaches for her reprehensible conduct the day before, it was a sad mistake. Hardly had the fire been kindled and the rusty iron kettle filled with water, when a young man came treading heavily

MR. STANDNEGE.

through the laurel thicket above the spring, leaped down the crag, and saluted her.

"Mornin', S'phiry Ann."

"Mornin', Gabe," she said, blushing vividly and busying herself piling unnecessary fuel on the fire.

He was a fine specimen of the mountaineer, lithe, well-made, toughened to hardy endurance, with tawny hair falling to his collar, and skin bronzed to a deep brown. He wore no coat, and his shirt was homespun, his nether garments of coarse brown jeans. He carried a gun, and a shot-bag and powder-horn were slung carelessly across his shoulders.

"I knowed you'uns had a way er washin' on Monday, so I jest thought bein' as I was out a-huntin' I'd come roun'," he said, sitting down on the wash-bench, and laying the gun across his lap.

"You'uns air welcome," she said, taking a tin pail and stepping to the spring to fill it.

"I wouldn't 'a' 'lowed so from yiste'day," darting a reproachful glance at her.

She made no reply.

"What made you'uns do it, S'phiry Ann?" he exclaimed, no longer able to restrain himself. "I ain't desarved no sech; but if it was jes' ter tease me, why —"

She raised up with the pail of water.

"No, it wasn't that," she said in a low tone, her eyes downcast, the color flickering uncertainly in her face.

"Then you'uns didn't mean what was said that night a-comin' from the Dillin'ham gatherin'," he cried, turning a little pale. "Mebby it's somebody over in Boondtown settlement," a smoldering spark of jealousy flaming up.

"It's the 'stillery, Gabe," she said, and suddenly put down the pail to unburden her trembling hands. "You'uns hadn't ought ter go inter it."

"But the crap last year made a plum' failure," he replied excusingly, his eyes shifting slightly under the light of hers. She was standing by the spring, against a background of dark green, a slanting sunbeam shifting its gold down through the overhanging pine on her dark, uncovered head, lighting up her earnest face, lending lustrous fire to her eyes. The scant cotton skirt and ill-fitting bodice she wore could not destroy the supple grace of her figure, molded for strength as well as beauty.

"The crap wusn't no excuse, an' if you'uns mus' make whisky up thar on the sly, I ain't got no more tu say, an' I ain't got no use fer ye."

"Yer mean it, S'phiry Ann?"

"I mean it, Gabe."

"Then you'uns never keered," he cried with rising passion, "an' that half-way promise ter marry me was jest a lie ter fool me, nothin' but a lie. I'll make it if I please," bringing his hand down on the bench with a fierce blow.

"An' hide in the caves like a wild creetur, when the raiders air out on the mountains?" she scornfully exclaimed.

His sunburned face flushed a dull red, and he writhed under the cruel question.

"They ain't apt ter git me, that's certain," he muttered.

"You'uns don't know that," more gently. "Think o' Al Hendries an' them Fletcher boys. They thought themselves too smart for the officers, but they wasn't. You'uns know how they was caught arter lyin' out for weeks a-takin' the sleet an' rain an' all but starvin', an' tuk down ter Atlanty an' put in jail, an' thar they staid a-pinin'. I staid long er Al's wife them days, for she was that skeery she

GABE AND S'PHIRY ANN.

hated ter see night come, an' I ain't forgot how she walked the floor a-wringin' her hands, or settin' deep over the fire a-dippin' snuff or a-smokin' — 'twas all the comfort she had — an' the chillun's axin' for their pap, an' she not a-knowin' if he'd ever git back. Oh! 'twas turrible lonesome, plum' heart-breakin' to the poor creetur. Then one day, 'long in the spring, Al crept in, all broke down an' no 'count. The life gave outen him, an' for a while he sot roun' an' tried ter pick up, but the cold an' the jail had their way, an' he died."

She poured out the brief but tragic story breathlessly, then paused, looked down, and then up again. "Gabe, I sez ter myself then, 'none o' that in your'n, S'phiry Ann, none o' that in your'n.'"

She raised the bucket and threw its contents into a tub.

Gabe Plummer cast fiery glances at her, the spirit and firmness she displayed commanding his admiration, even while they filled him with rage against her. Yes, he knew Al Hendries's story; he distinctly remembered the fury of resentment his fate roused among his comrades, the threats breathed against the

law, but he held himself superior to that unfortunate fellow, gifted with keener wits, a more subtle wariness. The stand S'phiry Ann had taken against him roused bitter resentment in his soul, but the fact that he loved her so strongly made him loath to leave her. A happy dream of one day having her in his home, pervading it with the sweetness of her presence, had been his close and faithful companion for years, comforting his lonely winter nights when the wind tore wildly over the mountains, and the rain beat upon his cabin roof, or giving additional glory to languorous summer noons, when the cloud-shadows seemed to lie motionless on the distant heights, and the sluggish river fed moisture to the heated valley.

What right had she to spoil this dream before it had become a reality? He could not trust himself to argue the matter with her then, but abruptly rose to his feet.

"We'uns'l not say any more this mornin', though I do think a-settin' up Al Hendries's wife agin me is an onjestice. Me an' some o' the boys air comin' down ter ole man Whitaker's this evenin', an' bein' agreeable I might step down to see you'uns agin."

"Jest as ye please," she quietly replied, then with a tinge of color added, "If you'uns'l go back ter the clearin' I'll do jest what I promised, Gabe."

But without saying whether he would or would not, Gabe shouldered his gun and went away.

S'phiry Ann had been very calm and decided throughout the interview, but the moment her lover had disappeared, she sank trembling on the bench, her face hidden in her hands.

"If it hadn't 'a' be'n for thinkin' o' Al Hendries's wife I never could 'a' stood up agin him," she sighed faintly.

A squirrel springing nimbly from a laurel to a slender chestnut-tree paused on a swaying branch to look at her, and a bird fluttered softly in the sweet-gum above her. The sun slipped under a cloud, and when she rose to go about her work, the spring day had grown gray and dull. It sent a shiver through her, as she stared dejectedly at the overshadowed valley. She had little time though for idle indulgence, she must be at her washing; and presently when the clouds had drifted away, and the sunshine steeped the earth in its warmth again, her spirits rose, a song burst from her lips,—an ancient hymn, old almost as the everlasting mountains around her.

The day waxed to full noon, then waned, and S'phiry Ann spread the clothes on the garden fence and the grass to dry. There were other duties awaiting her. The geese must be driven up, the cows milked, and water

brought from the spring foreevening use. Then she would put on her clean cotton gown, and smooth the tangles out of her hair, before Gabe came in. It was all accomplished as she had planned, and at dusk she sat on the rear step of the entry taking a few minutes of well-earned rest. The light streamed out from the kitchen, falling across the clean, bare yard and sending shifting gleams up among the young leaves of the trees. On the kitchen step sat Eph, an orphan boy of twelve or thirteen the Standneges had adopted, whittling a hickory stick for a whistle, and at his side crouched a lean, ugly hound. S'phiry could see her father tilted back in a chair against the loom, talking to Jim Wise, a valley farmer who had come up to salt his cattle on the mountains, while her mother and sister passed back and forth, preparing supper. The voices of the men were raised, and presently she heard Wise say:

"The raiders air out ter-night, so I hearn comin' up the mountain. They air expectin' ter ketch up with things this time, bein' as somebody has been a-tellin',—it 'pears so any way."

S'phiry Ann pressed her hands together with a little gasp.

"The boys air got they years open," said Mr. Standnege with a slow smile, his half-shut eyes twinkling.

"But this is er onexpected move, an' they mayn't be a-lookin' for it," persisted the other man.

"They air always a-ready an' a-lookin'. They ain't ter be tuk nappin'."

But the girl listening with breathless attention shivered, not sharing her father's easy confidence. She remembered that Gabe Plummer had said they were coming down to old man Whitaker's, and she knew that they were off guard. They would be caught, she thought, with a cold sensation around her heart; Gabe would be put in jail, and locked up, probably for months, and then come back with all the youth and strength gone from him. Even as these thoughts were passing through her mind, a sound fell on her ears, faint, far away, and yet to her, alert, keenly alive to the approach of danger, terribly significant. It was the steady tramp of iron-shod hoofs upon the road, and it approached from the valley. She sat motionless, but with fierce beating heart, listening and feeling sure it was the enemy drawing near.

The *rèvenue* men had always looked upon the Standneges as peaceful, law-abiding citizens, and though no information had ever been obtained from them, the officers sometimes stopped with them, lounged on the entry, or sat at their board, partakers of their humble

fare. Probably they intended stopping for supper. The girl devoutly hoped they would. The steady tramp grew louder, the hound pricked up his long ears, sniffed at the air, then dashed around the house with a deep, hostile yelp. The next moment a party of horsemen halted before the gate. Her fears were realized.

The dog barked noisily, the men chaffed each other in a hilarious way, while the horses stamped and breathed loudly, and the quiet place seemed all at once vivified with fresh life. Standnege went out to the gate, followed by his guest; Mrs. Standnege and Polly came to the door and peered out, and Eph hurriedly closed his knife and thrust the whistle into his pocket preparatory to following his elders. The officers would not dismount, though hospitably pressed to do so.

"'Light, 'light, an' come in; the wimmen folks air jest a-gettin' supper," said Standnege cordially.

"Business is too urgent. We are bound to capture our men to-night. Why, the whole gang are coming down out of their lair to old man Whitaker's to-night, so we have been informed, and we must be on hand to welcome them."

Eph crossed the yard, but when he would have stepped up to take a short cut through the entry, his hand was caught in another hand so cold it sent a shiver of terror over him.

"My — why, S'phiry Ann!" he sharply exclaimed.

"Hush!" she whispered, drawing him out of the light. "Will you'uns go with me ter old man Whitaker's, Eph?"

"This time o' night?"

"Yes, now."

"It's more'n a mile."

"We'uns'l take the nigh cut through the woods."

"Dark as all git-out."

"I'm not afeerd; I'll go erlone then," she said with contempt.

"What air you'uns up ter? Good Lord! S'phiry Ann, do you'uns think that could be done an' they a-ridin'?" suddenly understanding her purpose.

"Nothin' liketryin'," she replied, and glided like a shadow around the corner of the house.

The boy stared for a moment after her.

"Well, I never!" he muttered, and followed on.

They ran through the orchard, an ill-kept, weedy place full of stunted apple-trees, across a freshly plowed field to the dense, black woods beyond. It was a clear night, the sky thickly set with stars, and low in the west a pale new moon hanging between two towering sentinel peaks, but the light could not penetrate to the narrow pathway S'phiry Ann

had selected as the nearest route to Whitaker's. The awful solitude, the intense darkness, did not daunt her. She knew the way, her footing was sure, and she ran swiftly as a deer before the hunters, animated by one desire, to get to Whitaker's before the officers. It was a desperate chance. If her father detained them a few minutes longer,—but if they hastened on,—she caught her breath and quickened her own steps. Eph stumbled pantingly along behind her, divided between admiration at her fleetness and anger that he had been called on to take part in such a mad race.

In speaking of it afterwards, he said:

"I never seed a creetur git over more ground in ez short a time sence that hound o' Mis' Beaseley's got pizened. It's a dispens'i'n er providence her neck wusn't broke a-rushin' through them gullies an' up them banks, an' it so dark you'uns mought 'a' fell plum' inter the bottomless pit an' not a knowed it."

But S'phiry Ann had no consideration to spare to personal danger, as she broke through the underbrush and climbed stony, precipitous heights. Once an owl flew across her way, its outspread wings almost brushing her face, and with a terrified hoot sought a new hiding-place. The wind swept whisperingly through the forest, and a loosened stone rolled down and fell with a dull hollow sound into the black depths of the ravine below them. Eph wished they had brought a torch, wished that he had not come, then struck out in a fresh heat, as he heard a mysterious rustling in the bushes behind him.

At last they emerged from the woods opposite Whitaker's, and S'phiry Ann leaned for a moment against the fence, panting, breathless, but exultant. She had won the race.

The house was only one forlorn old room, built of rough hewn logs, with a rickety shed in the rear. A small garden spot and the meager space inclosed with the house comprised all the open ground. Mountains rose darkly above it, and below, the mountain road wound and twisted in its tortuous course, to the fair, open valley. At the back of the dwelling the ridge shelved abruptly off into a deep ravine, dark the brightest noonday, an abyss of blackness at night.

From the low, wide, front door ruddy light streamed generously, defying the brooding night, playing fantastic tricks with the thickly growing bushes on the roadside. The girl had a good view of the interior, the men lounging around the fire, the vivid flame of pine knots bringing out the lines in their tanned weather-beaten faces, flashing into their lowering eyes, and searching out with cruel distinctness all the rough shabbiness of their coarse homespun and jeans.

There were the Whitaker boys, hardy, middle-aged men; Jeff Ward, a little shriveled fellow with long, tangled, gray beard and sharp, watchful eyes; Bill Fletcher, who had bravely survived the trials which had proved the death of his comrade, poor Al Hendries; Jeems Allen, a smooth-faced boy, and Gabe Plummer. He sat somewhat aloof from the others, staring gloomily into the fire, instead of giving attention to the lively story Jeff Ward was telling. At one end of the great hearth, laid of rough unhewn rocks, sat old man Whitaker, at the other, his wife,—a gray and withered couple; he tremulous with age, she deaf as a stone.

Nobody seemed to be on the lookout for enemies. The wide-flung door, the brilliant light, the careless group, gave an impression of security.

What had become of the revenue officers? No sound of hoofs struck upon the hard road, or murmur of voices betrayed hostile approach. Eph turned and peered down the road, then clutched excitedly at his companion's arm.

"Good Lord, S'phiry Ann! they're right down there a-hitchin' they horses an' a-gittin' ready ter creep up. I'm er goin' ter leave here."

S'phiry sprang across the fence, and the next moment stood in the door.

"The raiders, the raiders air a-comin'," she cried, not loudly but with startling distinctness; her torn dress, wild, loose hair, and brilliant excited eyes, giving her a strangely unfamiliar aspect. The warning cry thrilled through the room and brought every man to his feet in an instant.

"Whar? which way?" exclaimed young Jeems Allen, staring first up among the smoke-blackened rafters, then at the solid log wall.

"Tain't the time fer axin' questions, but fer runnin', boys," said Jeff Ward, making a dash toward the back door, closely followed by his comrades. Gabe Plummer had made a step toward S'phiry Ann, but she vanished as she appeared, and he escaped with his friends into the fastnesses of the woods. There was a shout from the raiders, creeping stealthily around the house, a disordered pursuit, and over the cabin the stillness following a sudden whirlwind seemed to fall.

S'phiry Ann crept cautiously out from the chimney-corner, slipped over the fence, and knelt down on the edge of the bushes, to watch and wait. The officers soon returned with torn clothes, scratched hands and faces, but without a prisoner. They were swearing in no measured terms at being baffled of their prey.

Old man Whitaker and his wife had quietly remained in the house, apparently not greatly moved from their usual placidity. Once the old woman dropped the ball of coarse yarn

she was winding and rose to her feet, but the old man motioned her down again. They were questioned by the officers, but what reliable information could be expected from an imbecile old man and a deaf old woman! The girl could overlook the whole scene from a crack in the fence,—the officers stamping about the room, the scattered chairs, the old people with their withered yellow faces, dim eyes, and bent, shrunken forms, and the dancing flames leaping up the wide sooty chimney. Satisfied that the distillers were safe, she softly rose and started across the road. One of the men caught a glimpse of her, the merest shadowy outline, and instantly shouted:

"There goes one of 'em now."

She heard him, heard the rush of feet over the threshold and the bare yard, and, without a backward glance, fled like a wild thing through the woods, home.

One afternoon, a week later, S'phiry Ann drew the wheel out into the middle of the kitchen floor, tightened the band, pulled a strip of yellow corn husk from a chink in the logs, and set herself to finish spinning the "fillin'" for the piece of cloth in the loom. Her mother and sister were out in the garden sowing seeds, Eph was cutting bushes in the new ground, and she could hear the loud, resonant "guhaw" with which her father guided the ox drawing his plow. It was a serenely still day, with the heat of midsummer in its glowing sunshine, with only a fleck of cloud here and there along the horizon, and mountains wrapped in a fine blue haze.

It had been a trying week to S'phiry Ann, but she had no time to mope and brood over her anxieties, no inclination to confide them to her family. She had not shirked daily duties, but went about them silently and without enthusiasm. The revenue officers, disgusted, angered, at their disappointment, lingered on the mountains several days seeking something to lay violent hands on. One still they found and destroyed, but if the earth had opened and swallowed them, their prey could not have disappeared more completely. The law is strong, but it loses its power when carried into the strongholds of the mountains, majestic, clothed in repose, yielding up their secrets only to those bred and born upon them.

S'phiry Ann lifted her eyes to the lofty heights, yearning to know if her lover and his friends had found safe refuge, trembling with terror every time the dog barked or an ox-cart creaked slowly along the road. When the family were made acquainted with her part in that Monday night raid, there were various exclamatory remarks at the inconsistency of her behavior. Mrs. Standnege dropped her pipe, and stared at her in great amazement.

"Well, ef you'uns don't beat all! Last Sunday a-slightin' Gabe Plummer at meetin', an' now mighty nigh a-breakin' yer neck ter git him outer the way o' the raiders."

"Gabe wasn't the only one thar," said the girl in a low tone.

"But it stands ter reason you'uns wouldn't 'a' done it, ef he hadn't 'a' be'n thar. Yer pap may hev ter look out fer a new farm-hand arter all," with a touch of facetious humor, but watching the slow reddening of the girl's throat and face. Standnege came to her aid.

"Let her be, ma, an' work it out in her own mind. 'Thar ain't no 'countin' fer the doin's o' wimmun folks, no how. They air mighty oncertain creeturs."

"Why, pap!" exclaimed his eldest daughter, a mixture of indignation and reproach in her tone.

"Now I ain't a-meanin' ter throw off on 'em, an' I don't say as they ain't all steddly enough when they settle down, but a gal in love is the oncertaintest creetur that ever lived. Now S'phiry Ann ain't a-lackin' in common sense an' grit, if she does belong to me," he continued, with calm impartiality; "an' ef she wants ter marry Gabe Plummer 'fore craps air laid by, she kin do it."

But it was Monday again, and S'phiry felt that her fortune was still an unsettled thing.

"Ef it hadn't 'a' be'n for thinkin' o' Al Hendries's wife," she said to herself again and again, and the old spinning-wheel flew swiftly beneath strong, young fingers, and the yellow corn husk on the spindle filled slowly with smooth, even thread. She could look as downcast and troubled as her heart prompted, for no curious eyes were resting on her. Was it true? A shadow suddenly darkened the doorway.

"Howd'y'do, S'phiry Ann?"

The half-twisted thread fell from her fingers, writhed and rolled along the floor, fair sport for the kitten lazily coiled on the hearth, while she turned toward the secretly wished-for, but unexpected, visitor. She trembled, and the color in her face flushed and paled.

"Gabe!" Then quickly, and with a swift

searching glance toward the road, "is it safe for you'uns ter be here?"

"Yes, they air gone—an' ter the devil, I hope." He leaned against the wall, jaded, forlorn-looking, the week of hiding out not improving either temper or appearance.

"Take a cheer, an' set down, Gabe," she said, a vibration of tenderest pity in her voice.

"I ain't a-keerin' tu rest jest yit. That was a good turn you'uns done us t'other night. No tellin' where we'uns would be now ef it hadn't 'a' be'n fer that. I don't know how to thank you'uns fer it, S'phiry Ann," he said with strong emotion in his voice.

"Don't, Gabe!" she stammered, stooping to snatch the tangled thread from the paws of the kitten.

"Would you'uns 'a' done it fer me?"

"T'ain't fair tu be axin' sech questions," she said defensively.

"'Cordin' tu promise you'uns air tu marry me."

"I said it ef you'uns ud go back tu the clearin'."

"Yes, an' that's jest what I'm a-goin' tu do. I've had a week o' thinkin', an' now I'm willin' tu 'low you'uns kin hev your way. Ain't I be'n afeerd tu put my head outen the holler?" he continued in angry disgust; "afeerd tu tech a dead leaf fer the noise it made, afeerd tu draw my breath, an' I tell ye I ain't a-hankerin' arter any more sech days, an' I tole the boys so, an' I'm a-goin' back tu the clearin' ef every crap fails."

S'phiry Ann stood by the wheel, her face turned from him, silent, motionless. He waited a moment, then strode across the floor, and laid his hand on her shoulder.

"We'uns mus' settle it now, S'phiry. I ain't a-blamin' you'uns now, though I don't say as I didn't back yander a week ergo, fer standin' tu principle."

"If it hadn't 'a' be'n fer thinkin' o' Al Hendries's wife," she said gently.

"I've be'n a-lovin' you'uns er long time, an' its time tu settle what we air a-goin' tu do."

"The clearin' settles it, Gabe," she murmured, and turned her head slowly until her eyes, softly radiant, met his eager, ardent ones.

Mat Crim.

AT THE GRAVE.

IN MEMORY OF A. M.

IT is a world of seeming:
The changeless moon seems changing ever,
The sun sets daily, but sets never
So near the stars and yet so far;
So small they seem, so large they are!
It is a world of seeming.

And so it seems that she is dead;
Yet so seems only; for, instead,
Her life is just begun; and this—
Is but an empty chrysalis;
While she, unseen to mortal eyes,
Now wins her way in brighter skies—
Beyond this world of seeming.

Henry Ames Blood.

THE RELATIVE STRENGTH AND WEAKNESS OF NATIONS.*

TWO STUDIES IN THE APPLICATION OF STATISTICS TO SOCIAL SCIENCE.

NATIONAL DEBTS—PER CAPITA.

It may be claimed that the debts of the several States constituting the United States should be added to the national debt. In 1880 the total amount of such debts was \$226,597,594, since which date they have been diminished by large payments in many States. The present debt of all the States is not in excess of \$4.00 per capita of the whole population. The data for computing department, county, city, town, and communal debts are not within the reach of the writer; but as these debts have been mostly incurred for public improvements, both in Europe and in this country, they do not come into the same category with the war debts of nations.

II.

WEAKNESS.

HAVING analyzed the strength of Democracy in America, we may now turn our attention to the other side, and consider the sources of the weakness of nations which are governed by dynasties.

In Professor J. R. Seeley's recent book upon the expansion of England, he has traced nearly all the European wars of recent times to the struggle of nations for dominion over other continents or parts of continents, in order to establish colonies and to control commerce therewith; commerce itself having been regarded by almost all nations, and being now regarded by the greater number, as a *quasi* war in which what one nation gains another must lose.

This fallacy has led to very many of the

† It should be stated that a considerable part of the debt of Germany and Belgium, and a small part of that of France, was incurred in the construction of railroads, but most of these railroads have been constructed for military purposes. A large part of the debt of Canada has also been incurred for the construction of railroads which are at present very unprofitable.

great actual wars of the last century and a half, and the vast national debts of Europe have been incurred in this futile and foolish attempt to set up as a rule among nations:

“ Let him take who has the power,
And let him keep who can.”

The business man who fully comprehends the function of the merchant and of the manufacturer, and the place which commerce holds in the beneficent progress of the world, may well covet the genius of Southey in order that he might add new verses to the “ Devil's Walk ” as he passes in review the great wars which have been fought to gain the control of commerce which could have been had for the asking, and which would then have yielded a vastly greater benefit to both parties than either could gain by attempting to get an advantage over the other.

What more fruitful subject for the satirist than the bluster of the party politician at the present time, whose zeal is apparently in inverse proportion to his sincerity, in regard to the respective claims of this country and of Canada over the right to fish within a certain distance from the coast, when it would benefit both countries to put the regulation of all the fisheries under a joint control, so that both might be far better served with fish than either can now be?

What greater economic blunder has ever been committed than the support of slavery in this country for nearly a century of its history? It was the most costly and least productive system of labor, brutalizing to the black man and debasing to the white man, yet it was justified by men of such intelligence and force that had it not been for the narrowing influence and the bitter apparent necessity imposed upon them to sustain a crime against humanity, they might have left a reputation as statesmen.

What more ludicrous commentary upon the intellectual mediocrity of legislators than the demand lately presented in Congress by the representatives of one of the New England States for a heavier duty upon sugar when imported in bags rather than in boxes, in order that the Cuban planters might be compelled to buy the decreasing timber supply of the forests of Maine in the form of sugar-boxes and charge it back to all consumers of sugar in this country?

Could there be a more complete *reductio ad*

RELATIVE BURDEN OF NATIONAL TAXATION

Per capita of the principal commercial or manufacturing states of Europe which are solvent; and of the United States (omitting local taxation for departments, counties, cities, or for town purposes)

The true burden of taxation may not be measured even by the proportion which the taxes of one country bear to another. The measure of importance is what ratio do they bear to the productive capacity of each nation or state, and for what are they expended. These matters are treated in a subsequent table.

absurdum than the conclusion to which the late Henry C. Carey was led by his lack of insight in respect to the functions of commerce; namely, "that the material prosperity of this country would be more fully promoted by a ten-years' war with Great Britain than it could be in any other way"?

(I quote this from memory; the statement was made in a conversation to which I listened.)

Yet out of this very jealousy of nations we gained almost without cost one of our most important possessions.

One of the most singular of the incidents of one of these great European contests was the sale of the Louisiana territory to this country by the First Napoleon, who, being unable to keep it, chose that England should not possess it. In a few short weeks this territory might have come under the dominion of England. One's imagination can hardly grasp the changed conditions of the world as they would have been had Great Britain succeeded in getting and keeping the control of all that vast territory west of the Mississippi River which was comprised in this purchase, thus confining the United States substantially to what lies east of this mighty river.

It is a singular fact that there appears to be no historical school atlas in use in this

country in which the several additions to the territory of the United States are pictured and described; hence very few persons realize the vast importance and extent of the Louisiana purchase, or know the true conditions of the great contest with the slave power over the extension of slavery into what was known in 1830 as the Territory of Missouri, which comprised a vast area outside the limits of the present State of Missouri.

While modern European wars have thus become a struggle for the control of commerce, or for the control of vast areas of territory in the attempt to secure its commerce to single States, war itself has also been mainly sustained by what may be called commercial methods; that is to say, the rulers of nations have made use of bankers through whom they have pledged the national credit in order to support dynasties or to secure power to them. Even success in war has in later years depended as much upon the commissariat, or upon the business department of war, as upon the actual battles, or even more.

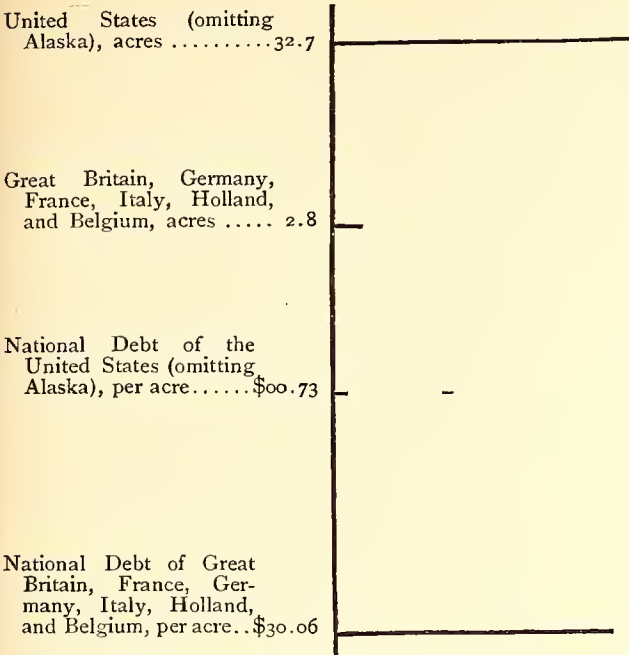

This possibility of mortgaging the future by incurring a national debt has finally become the chief cause of the weakness of nations. The same century that has witnessed the increase of European national debts from a little over \$2,600,000,000 to more than \$22,000,000,000 has also seen Spain, Portugal, Austria, and Greece become bankrupt, while Russia is without credit. The attempt to enforce the payment of the bonded debt of Egypt by the force of armies at the instance of foreign creditors may be held to be a disgrace to the nations that have engaged in the undertaking. The debt was incurred without the consent of the people, and even the interest cannot now be met without taking so large a share of the meager product of the fellaheen as almost to reduce them to starvation.

Before the century ends we may even witness a general repudiation of these national mortgages which the dynasties of the past have imposed upon the people of the present without their consent, and in almost all cases to their injury rather than to their benefit.

In order that the relative weakness of Europe caused by the burden of debts and of standing armies may be fully comprehended, the following statements are submitted:

The debt of the United States at its highest point, in 1865, was eighty-four dollars per head, which is now the average debt of the commercial and manufacturing states of Europe specifically named in the ensuing statement. The debt of the United States is now less than twenty-three dollars per head (or including all State debts, less than twenty-seven dollars). The national debt—now twenty-three dol-

ACRES PER HEAD OF POPULATION, AND DEBT PER ACRE.

The proportion of men under arms in the commercial and manufacturing states of Great Britain, France, Germany, Italy, Holland, and Belgium is 2,200,431. The cost of sustaining these forces in the last fiscal year was \$493,505,520, or at the rate of \$223 per man.

The force which is actually under arms, aside from the reserves, is at the ratio of one man to each 200 acres; and the annual tax for his support averages \$1.10 per acre.

The average cost per man in the army and navy of the United States, including the cost of ships, fortifications, navy-yards, and all other war expenses, is about \$1,600 annually per man. The ratio is one man under arms to each 51,000 acres, and the annual tax for his support and for all other military purposes is a fraction over three cents per acre.

lars — will probably all be paid within one generation from the date when it was incurred.

In the consideration of the following tables it must be borne in mind that the annual product of a nation or state is the source of all wages, taxes, rents, and profits, and that by so much as one element of these charges upon the annual product is greater must some other element be less. No scientific method has yet been invented by which taxes can be made to stay where they are first imposed. As a rule, taxation tends to diffuse itself over all consumption, and cannot be drawn in any large measure from what would otherwise be rent or profit. Hence, when the product is small, the necessary correlative of high taxation is a low rate of wages or earnings. Therefore, low wages in Continental Europe give no evidence of low cost of production, but rather indicate that the laborer is deprived of a large and undue share of his product by excessive taxation, chiefly for the destructive purposes of war or of preparation of war.

The debt of all Europe in 1884 and 1885 was.....	\$22,158,000,000
Population	334,000,000
Debt of the principal solvent and commercial states of Europe—Great Britain, France, Germany, Netherlands, and Italy...	\$13,269,447,000

Population at last census.....	157,549,817
Debt of the United States at its maximum, August 1, 1865, liquidated and unliquidated, as computed by Hon. Hugh McCulloch, Secretary of Treasury	\$2,997,386,203
Population	34,748,000
Debt of the United States, August 1, 1886.....	\$1,380,087,279
Population as computed by E. B. Elliott, Actuary of the Treasury, August 1, 1886	58,670,000

These figures of almost inconceivable millions convey but little idea to any one who is not accustomed to such comparisons; it is only by considering them in relation to each person of the population, that the true measure begins to be defined.

In the accompanying tables will be found statements of the debt per capita, the annual taxation per capita, the debt per acre, and also the proportion which the present standing armies bear to the population and to the men of arms-bearing age.

Thus far all the facts which have been given have been taken from the “Financial Reform Almanac” of 1886, from “Martin’s Year Book” of 1886, and from the official documents of the United States.

I may now enter upon that part of my treatise which rests upon estimates only. These estimates must be accepted for what they are worth. It is admitted that they are somewhat hypothetical. Are they sustained by facts?

The true income of a nation is not the money by which it is measured; it is, in fact, the product of its labor and capital, consisting of the materials for food, for clothing, for shelter, fuel, metals, and the like, converted and reconverted until ready for consumption. These products are measured in money’s worth in the process of exchange, and it is important when making use of terms of money to carry with the measure of money the conception of the quantities of substance which money will buy, or which are exchanged for money.

In a very few cases certain countries, like England, possess an income from foreign investments of capital previously saved; but this is a very small element as compared to the value of its annual product.

In the following tables this increase of income from foreign investments has been considered with respect to the average value of the product per capita assigned to England.

I have attempted to establish a comparison of the product, per capita, of European countries, as compared to this country, at its measure in money. The known factors in the problem are, first, the relative rates of wages paid in the several countries considered, each

STANDING ARMIES AND NAVIES OF EUROPE
AND THE UNITED STATES,

Compared in ratio to the number of men of arms-bearing age, assuming one in five of the population to be of that age.

Standing armies of Europe in actual service 3,854,752
Men in the navies 263,622

Total armed force..... 4,123,374
Reserves ready for service at call..... 10,398,163

Total 14,521,537

Substantially one in five of all men of arms-bearing age.

Proportion of men of arms-bearing age in the standing armies and navies, *not* including reserves:

Proportion.		Exempts.

	14,252,915 or 1 “ 24 “
United States..... 36,294 or 1 “ 1610 “	

as compared to the other; second, the relative amount of national taxation per capita.

Another factor which may be deemed to be sufficiently well established for purposes of comparison is the value of the per capita annual product of the people of the United States, estimated at two hundred dollars' worth to each person.

The family group in this country consists of a fraction over five persons; the proportion who were occupied for gain was one in 2.90 in the census year, and may be computed as one in three at the present time. Two hundred dollars' worth per head would make the average product of each person working for gain six hundred dollars' worth of product per year.

The writer has himself devoted a great deal of examination to this subject, and his estimate of two hundred dollars' worth per head has been sustained by many other experts, official and unofficial. Accepting this measure as approximately true to the facts, it is

held that the value of the product, per capita, of other countries may be based upon the value of the per capita product of this country, since the product of other countries must bear substantially the same proportion to the rates of wages and the per capita tax of such country as the product of this country bears to these known factors.

In all the principal commercial and manufacturing countries of Europe and in the United States there is now such an amount of available accumulated capital, as to make it certain that if there is any art or industry in which a rate of profit ranging from five per cent. to fifteen per cent. can be obtained, that branch of work will be quickly and surely undertaken.

Hence it follows that if the sum of the wages at the current rates prevailing in each country can be ascertained, as well as the per capita taxes, we may ascertain the average value of the product of such labor by adding to these elements of cost from five per cent. to fifteen per cent. as the corresponding profit. In other words, there must be a necessary relation in the ratios which profits, wages, and taxes bear to each other in each commercial or manufacturing country, according to the respective conditions of industry in that country.

For example, assuming that one person sustains two others in France as well as in this country, we know first that the average wages in France are not more than sixty per cent. the rate of wages in this country. We also know

that national taxes are eighteen dollars per head in France and less than five dollars here. We need therefore only to establish the rate of profit which will induce the employment of capital in the arts which can be established in France in order to reach an approximate estimate of the average value of the product of each person employed in productive industry.

We may take as a class any group of skilled mechanics or artisans in the United States who earn two dollars a day, or six hundred dollars a year, each one supporting two other persons.

Their net wages each, free of national taxes, would be..... \$585
Their proportion of national taxes for three persons at \$5 per capita..... 15

Wages and taxes..... \$600

Now if any one can make ten per cent. upon this sum, capital will be found for the employ-

RELATIVE PROPORTION OF THE ASSUMED PRODUCT PER CAPITA WHICH IS ABSORBED BY NATIONAL TAXATION ONLY, ON THE BASIS OF PREVIOUS COMPUTATIONS.

The proportion divided off at the end represents national taxation. The remainder is what is left to be applied to local taxation, rent, profits, earnings, and wages.

United States, product estimated \$200 per capita.

England, product estimated \$175 per capita.

Great Britain and Ireland, product estimated \$150 per capita.

France, product estimated \$120 per capita.

Germany, product estimated \$100 per capita.

Italy, product estimated \$80 per capita.

Proportion of national taxation to estimated product:

ment of such men, and their product will be sold at such ten per cent. advance, if no more can be had, or at six hundred and sixty dollars.

This would make the final value of the product of such a workman six hundred and sixty dollars: divided into profits, sixty dollars; taxes, fifteen dollars; net wages, five hundred and eighty-five dollars.

We know that the corresponding rate of wages of a French artisan would not exceed, on the average, sixty per cent., or three hundred and sixty dollars, and that the proportion of national taxes due from him and his two dependants would be fifty-four dollars. But the gross product of France being less than it is in this country, it may require a larger proportion of the product to be assigned to profits; we will, therefore, call it fifteen per cent. on three hundred and sixty dollars, which is fifty-four dollars. This sum added to wages and taxes gives a gross value of the French workman's product, four hundred and fourteen dollars.

The ratios in this comparison would be:

Product per workman, United States	\$660
" " " France	414
" " capita, United States	220
" " " France	138

On the other hand, if the average annual product is only one hundred and thirty-eight

dollars' worth per head, or four hundred and fourteen dollars' worth for the earnings of one of a group of three by whom the two others are sustained, the reason is not that the work is not equal, but that the quantity of the product to each person is limited by the conditions under which the work is done. The same workman when removed to the United States may produce twice as much as in France with the same labor if he can adjust himself to his new conditions. The German immigrant actually does so. Does it not follow that wages are the reflex or result of the labor of the workman derived from the sale after profits and taxes have been set apart? Hence all attempts to compare the cost of production of any article by comparing the rates of wages must be entirely fallacious unless all the conditions of production are the same. The rates of farm wages are, on the average, four to five dollars per month with board, in Rhenish Prussia; in the United States they are four to six times as much, but the money cost of producing a bushel of wheat in Prussia is double the cost in many parts of the West, where machinery is used to an extent unknown

in Prussia and almost impossible on account of the very minute subdivision of the land.

The causes of the variation of the product per workman and per capita are, of course, manifold. The principal causes must be variation in:

First. The natural resources of the country.

Second. The efficiency of the workman in respect to mental training and manual or technical dexterity.

Third. The efficiency of the tools or machinery used.

Fourth. The full or deficient nutrition of the body.

Fifth. The freedom from obstruction in exchanging the surplus of one art or industry for what is deficient in another, either one part with another in the same country, or one country with another.

Upon this theory I have constructed the table on this page, to which reference may be made, and while no claim for positive accuracy in the money estimates can be made for it, it may perhaps be accepted as relatively or proportionately correct. The facts sustain these proportions, and therefore prove the theory to be correct.

Is it not also a matter of common observation that in a country like the United States,

in which laborers are perfectly free, the transfer of land and of other property very easy and very promptly made, the use of machinery fully comprehended, and any new inventions speedily adopted, that the product will be large in ratio to the number of persons employed?

Conversely, if the natural resources of a country are not large in ratio to the population, the transfer of land complex and difficult, machinery inadequate, and improved tools not readily accepted, then the product will be small in ratio to the number of laborers. It follows that if taxation takes a large share of such small product, wages must be very low, and subsistence must be very meager.

In this country all conditions are favorable to low cost of production, low prices, and high wages, and therefore conducive to a widely extended commerce. Labor is effective, capital ample, and the average burden of national taxation very light. The prices of our great staple products, such as grain, wool, and cotton, are practically determined by competition in the markets of the world. From fifteen per cent. to twenty per cent. of the product of agriculture of the United States finds its market in foreign countries. Therefore the price of all products of agriculture is determined by the price which the surplus will bring for export.

Agriculture represents the largest single industry; and the product being very large in ratio to the number of men employed, because of the fertility of the soil and the use of machinery, it follows that when the low rate of taxes has been set aside and the ratio of profit has been assigned which is required in order that capital may be invested in agriculture, the rates of wages or the earnings of farmers in this country are, relatively to other countries, very high. Under such conditions large earnings and high wages are the necessary correlative of the very low cost of the production of the staples of agriculture. One is the reflex of the other.

Up to this time the conditions of and the wages in all other arts in the United States have been practically determined by reference to the condition of and wages in agriculture. All other arts which have been undertaken in this country are therefore governed by corresponding rules; namely, by the application of machinery under the best conditions, the largest product is assured with the least expenditure of labor. Therefore in all arts, with few exceptions, after the low rate of taxation and such profit as is necessary to induce the investment of capital have been set aside, the general rate of wages has been very high, because the general cost of production has been low. The same rule, therefore, applies in all arts — that high wages or earnings are the re-

flex or complement of the large product, so long as labor and capital are left free to work together and are not subjected to excessive taxation. Hence no comparison of cost can be made by a comparison of wages unless all other conditions are identical.

This fact was very clearly seen by the late Secretary Frelinghuysen, and his successor, Secretary Bayard, begins his instructions to consuls in these terms: "There are certain natural and artificial conditions which so largely affect the direct conditions of wages as to be entitled to consideration in any analytical examination of the great question of labor. . . . It would be a legitimate field of inquiry to ascertain what are the conditions which enable England to manufacture machinery and other products at less prices than similar goods can be manufactured in France, and at prices equal to those in Germany, while the rates of wages paid to workmen engaged in such manufactures in England are, on the whole, higher than those paid for similar labor in France, and, as a foregoing table shows, more than double those paid in Germany."

"It is the wish of the State Department to pursue this inquiry in the direction indicated in this paragraph, and for this purpose the following general instructions are given to consuls, reference being made to the specific forms of interrogatory appended hereto or which will be sent hereafter."

This apparent paradox of high wages and low cost becomes very simple when applied by any employer to his own experience. In a dull time, when it becomes necessary to discharge a part of the working force, which are the operatives first discharged? Are they not those whose wages or earnings have been lowest — not those who have earned the most for themselves? Are not the men who earn the most for themselves retained because they are the most effective workmen and therefore most capable of producing goods at the lowest cost? Conversely, does not the fact which is apparently lost sight of by the proposed "organizers of labor" represent an absolute principle; namely, that the strong, industrious, and well-nourished manual laborer, or the skillful artisan or factory operative, will be substantially sure of continuous employment at the highest possible rate of wages, when the less able or competent can find no steady occupation?

Is not the rule of universal application in civilized countries that there must be a certain ratio between the *sum* of the wages and the taxes combined, and the profit which may be derived from the several arts and industries of each of the several countries?

It has been admitted that in very poor countries where hand labor prevails in greater

measure than the application of machinery, and where the taxes are very heavy while the product is very small, the ratio of profit must bear a larger proportion to the entire product than it does in a rich country where machinery is most fully applied and where the taxes are low.

In making the computations of the relative per capita product of the different countries, I have not attempted to cover this variation in the rate of profit, but I assume that, on the whole, any art in which capital can secure ten per cent. profit will be surely undertaken either in the United States or in England, France, Germany, and the Netherlands. Perhaps not in Italy without a higher rate of profit.

Upon this theory, and assuming that the product per capita of the United States may be valued at two hundred dollars' worth, that of England, with its income from foreign investments added, may not exceed one hundred and seventy-five dollars' worth; that of Great Britain and Ireland combined may be assumed not to exceed one hundred and fifty dollars' worth; that of France as not exceeding one hundred and twenty dollars' worth; that of Germany as not exceeding one hundred dollars' worth; that of Italy as not exceeding eighty dollars' worth; such being substantially the ratios which the average rates of wages with the per capita national taxation added bear to each other, and to the wages and taxes of the United States, with corresponding profits added in each case.

In order that this proposition may be made more clear, the foregoing table is submitted in which the line representing the product of each country is divided off into sections: in the sections on the right will be found the national taxation per capita; on the left, the value of what remains for distribution as wages, profits, and for municipal taxes. In the same table will be found the percentage which national taxes bear to the assumed per capita product.

In considering these remainders after national taxes have been set off, it must be borne in mind that municipal taxation as well as profits doubtless take a larger proportion in the poorer countries than in the richer ones. Hence that part of the product which may be assigned as the wages or earnings of the working people becomes less and less in proportion to the whole product, as the product itself diminishes in quantity and in value. "For he that hath, to him shall be given: and he that hath not, from him shall be taken even that which he hath."

These figures correspond to known facts. In Italy, which is relatively under a heavier burden of armies and taxes than any one of the countries treated, what is left to the

workman, either of his own product or what he can buy with his wages, now appears to be insufficient to sustain life in strength and vigor. Is it not also true that portions of the population of the German empire, especially in southern Germany, are living on the edge of starvation, becoming weaker as they become less well nourished?

In Egypt so much of the miserable product of a rich and productive country is taken away to meet the interest of a bonded debt imposed upon the people without their consent, that starvation exists in the Nile valley, which once sustained tenfold the present population in comfort.

Is it not true that France has reached its utmost limit of taxation, and the annual deficit is adding to the burden which cannot, perhaps, be borne much longer? Yet France may be saved from immediate bankruptcy by the richness of its soil and the intelligent economy of its people.

Is not the present burden upon Ireland the burning question in Great Britain?

May there not be found in these conditions the underlying causes of nihilism, anarchy, socialism, and communism upon the continent of Europe?

In considering what is left after taxes and profits have been set aside in these several countries, it must be remembered that an equal amount of money will buy a less amount of food in Europe than it will in the United States, and the price of food is much more than half the cost of subsistence to a very large proportion of the working people of Europe; else we should not be exporting the products of our fields to European countries, and there would be no call for prohibitory laws, or for high duties on grain and pork in a vain attempt to promote an increase of the farm products in Germany and in France by such artificial methods.

The true measure of these burdens upon industry may be, perhaps, more accurately measured in terms of work than when stated in terms of money or of men. The product of every country stands for so much work. In the census year the work of this country, manual, mental, mechanical, and manufacturing, was performed by one in three of the population so far as gain in money was the object of the work, the bread-winners numbering 17,400,000 in a little over 50,000,000 population.

The national and municipal taxes of that year were proportionately higher than they are now; all taxes, national, State, and municipal, in that year required substantially seven per cent. of the highest estimate of the value of the total product. This percentage

being applied to persons, represented the year's work of men numbering 1,218,000, whose labor was devoted either to the direct work of government, or in sustaining all the forms of government by way of national, town, city, county, and State taxes.

The national taxes only of the United States are now about two and a half per cent. of the product, and they therefore represent the work of 500,000 persons out of about 20,000,000 workers. This body of half a million persons is either employed directly in the service of the Government, or else is occupied in sustaining those who are in such service.

In the preceding table the proportion of the annual product assigned to national taxes is represented by percentage upon the assumed per capita product of each country.

If the burden upon the United States corresponded to the several percentages assigned to other countries, the number who would be engaged either in the service of the Government, civil or military, or in sustaining those who perform this work, would be according to the following computation, it being assumed that out of our present population, approaching sixty million persons, twenty millions are at work in various occupations in sustaining the whole body politic:

At the ratio which the national taxes now bear to product in the United States, the actual work required to sustain all the functions of the National Government, directly or indirectly, is that of . . .	500,000 men.
At the ratio which the national taxes bear to the assumed product of England, the proportionate number of men who would be required in support of the functions of government in the United States would be	1,348,000 "
At the ratio assigned to Great Britain and Ireland as a whole	1,574,000 "
At the ratio assigned to France . . .	3,000,000 "
" " " " Germany . .	2,400,000 "
" " " " Italy	2,950,000 "

It will be apparent to any one who reasons upon these figures, that if either one of these proportionate services in sustaining government, except perhaps that of Great Britain, were in force in this country, it would put a strain even upon our abundant resources that we could scarcely bear. What must then be the burden of those who are thus loaded?

The computed product of two hundred dollars' worth per head of our population after setting aside ten per cent. as the maximum addition to capital, and six per cent. as the maximum of all our present national and municipal taxes, leaves only one hundred and sixty-eight dollars' worth to each man, woman, and child. This being divided by three hundred and sixty-five days in the year leaves but

forty-six cents' worth per day for shelter, clothing, and food for each person. A variation of five cents per day to each person from this computed average stands for an additional product worth more than \$1,000,000,000 a year.

Let it be assumed for a moment that our two hundred dollars' worth of product, of which two and a half per cent. supports the National Government, were depleted by national taxation to the extent of fifteen per cent., as the product of France now is, a difference of twelve and a half per cent.; then the average sum available to each person, per day, would be reduced from forty-six cents to a fraction under thirty-nine cents; not apparently a great variation,—only about the price of a glass of beer,—yet six cents a day comes to over \$1,300,000,000 on our present population.

If we assume that one in three of the population of Great Britain, France, Germany, and Italy is occupied for gain, the whole number of workers is a fraction less than 50,000,000 out of a population a little less than 150,000,000.

At the respective ratios assigned to the functions of government, the total number engaged in such functions is now in those four countries 6,067,000, or a fraction over twelve per cent. of the whole working force, occupied either as soldiers in active service, as officials in the civil service, or in sustaining these classes with bread, meat, and shelter. The actual number of men under arms in these countries is 2,086,000, and they cost two hundred and twenty-five dollars each. It surely takes at least one peasant's or one operative's product to sustain one soldier. If the armies and navies require the services of 2,086,000 men, and if the work of as many more is required to sustain them, then the waste of preparation for war requires the constant work of 4,176,000 men out of 30,000,000 men of arms-bearing age in Great Britain, France, Germany, and Italy, computing one in five of the population of arms-bearing age. This is very nearly one in every seven of the adult men. Deducting this number from the whole number assigned to government service as above 6,067,000, the remainder is 1,891,000, or proportionately about fifty per cent. more than have been assigned to the support of the National Government to the United States aside from their army and navy. The number needed to earn the interest on the national debts of those countries above the proportion required in the United States would fully account for this disparity.

Do not these facts sustain the approximate accuracy of all the preceding computations? Does not the burden of armaments only re-

quire ten to twelve per cent. of the whole number of men of arms-bearing age in those countries, or eight to ten per cent. of the whole working force, if the proportion of working men and women to the population is the same as in the United States; to wit, one in three?

But is such the proportion of men and women who must labor to the utmost for subsistence? When men are wasting their time in camp and barracks, are not the women and children forced to labor in such a way that the physical stamina of the race is deteriorated, and material prosperity sapped at its very foundation?

What must then be the necessary conditions of life when the money's worth to be divided among the families of those who do the actual work of production is only one-half as much as it is in the United States? If the product of Germany is only one hundred dollars' worth per head, it will yield less than *twenty-eight cents'* worth per day for all taxes, subsistence, profits, and wages to each person. If the product of Italy is worth only eighty dollars per head, all taxes, profits, and wages must be derived from *twenty-two cents'* worth per day to each person.

If, on the other hand, the average value of the product per capita of these European countries cannot be deduced *a priori* according to the theory presented, then again we must go back to the facts; and we then find in all the various reports upon the condition of a vast body of the population of Europe that they are actually subsisting upon much less than half the income of the working people of this country. The facts sustain the theory, and the theory may explain the facts.

Many records may be found in recent consular reports of the families of German and Italian peasants who are subsisted on only four to five cents' worth of food for each person per day; and even at that price the cost of food is sixty or seventy per cent. of the whole cost of living.

On the other hand, if such are the facts as to the common life of great masses of the people, and if we cannot deduce the per capita annual product of each worker in Europe by adding ten per cent. for profit or addition to capital to the average rate of wages and the average burden of taxes,—that is to say, if the product of either country is greater per capita than this measure, then it follows that the privileged classes of Europe are securing to their own use a very much larger share of the annual product than the capitalists of this country can thus secure; and this adds to the danger and complexity of the problem in Europe, rather than rendering it more simple.

What then do these figures and facts mean? Is not the apparent strength of the armaments

of European nations a source of weakness which is now working at the foundation of the present forms of society upon the continent?

Is not our apparent weakness the very source of our strength?

Are we not stronger *without* expensive fortifications, navies, and other armaments than we should be if we spent our force in constructing them?

May not the time be near at hand when it shall no longer be lawful for one generation to mortgage the labor of the next by any national and perhaps by any municipal debt? When pay as you fight becomes the rule, will not war become almost impossible?

May not the right government of cities be found in more strictly limiting the power of cities or towns to incur debts?

Has not the power of the rings which have plundered our great cities been founded mainly in the abuse of public credit? Could Tweed have stolen the property of the people of the city of New York had he plundered them by direct taxation?

These may be questions which will soon require an answer, and which are perhaps suggested by the figures and the facts submitted in this treatise.

It may be said that the present relative conditions of Europe as compared to the United States require no statistics to bring them into view. Perhaps not; yet when a great bankruptcy occurs or is impending, the first call of the business man is for the trial balance. Such bankruptcies sometimes occur in arts which are most necessary and which must be continued. When the settlement has been made after the bankruptcy, the business is reestablished, but the expensive supernumeraries who had previously lived upon the work of others are afterward set to work to earn their own living.

In what way the representatives of the dynasties and privileged classes of Europe, or those whose present trade is war, will get their living after a hungry democracy has called for a settlement of accounts will be an interesting problem to watch.

The business of government is necessary and must be continued. How will it be reorganized after the impending settlement of accounts in Europe has been completed?

Many other applications of the statistics of these two studies will suggest themselves to him who can read what is written between the graphical lines or underneath the figures. Except to one who possesses such an imagination, statistics may be but dry bones, and all figures may be mere rubbish.

Edward Atkinson.

[In the table on page 430 of THE CENTURY for January, "Grain crop 256%" should read "Grain crop 167%."]

LEE'S INVASION OF PENNSYLVANIA.

"CARRY ME BACK TO OLE VIRGINNY."

ONE night in the spring of 1863, I was sitting in my tent opposite Suffolk, Virginia, when there came in a slender, wiry fellow about five feet eight, with hazel eyes, dark hair and complexion, and brown beard. He wore a citizen's suit of dark material, and except for his stooped shoulders was well-formed and evidently a man of great activity. He handed me a note from Mr. Seddon, Secretary of War. That was my first meeting with the famous scout Harrison, who in his unpretending citizen's dress passed unmolested from right to left through the Federal army, visited Washington City, ate and drank with the Federal officers, and joined me at Chambersburg with information more accurate than a force of cavalry could have secured.

While my command was at Suffolk, engaged in collecting supplies from the eastern coasts of Virginia and North Carolina, General Burnside was relieved and General Hooker put in command of the Federal Army of the Potomac. General Lee was not expecting Hooker to move so early, and gave me no warning until the Federals moved out to turn his left by Chancellorsville. He then sent urgent demand for me, but it so happened that all my trains were down on the eastern coasts, and I could not move my troops without leaving the trains to the enemy. I made haste to get them back as quickly as possible, and the moment we got them within our lines I pulled up from around Suffolk, and, recrossing the Blackwater, started back on my march to join General Lee at

Fredericksburg. Before we got to Richmond, however, we received dispatches announcing the Confederate success. But with these tidings of victory came the sad intelligence that General Stonewall Jackson was seriously wounded, a piece of news that cast a deep gloom over the army.

On the 9th of May I joined General Lee at his headquarters at Fredericksburg. At our first meeting we had very little conversation; General Lee merely stated that he had had a severe battle, and the army had been very much broken up. He regarded the wound accidentally inflicted on Jackson as a terrible calamity. Although we felt the immediate loss of Jackson's services, it was supposed he would rally and get well. He lingered for several days, one day reported better and the next worse, until at last he was taken from us to the shades of Paradise. The shock was a very severe one to men and officers, but the full extent of our loss was not felt until the remains of the beloved general had been sent home. The dark clouds of the future then began to lower above the Confederates.

General Lee at that time was confronted by two problems: one, the finding a successor for Jackson, another, the future movements of the Army of Northern Virginia. After considering the matter fully he decided to reorganize his army, making three corps instead of two. I was in command of the First Corps, and he seemed anxious to have a second and third corps under the command of Virginians. To do so was to overlook the claims of other generals who had been active and very efficient in the service. He selected General Ewell to command the Second, and General A. P. Hill for the Third Corps. General Ewell was entitled to command by reason of his rank, services, and ability. Next in rank was a North Carolinian, General D. H. Hill, and next a Georgian, General Lafayette McLaws, against whom was the objection that they were not Virginians.*

In reorganizing his army, General Lee impaired to some extent the *morale* of his troops, but the First Corps, dismembered as it was,

* General D. H. Hill was the superior of General A. P. Hill in rank, skill, judgment, and distinguished services. He had served with the army in Virginia, on the Peninsula in the battles of Williamsburg, Seven Pines, and the Seven Days' battles around Richmond. In the Maryland campaign he made the battle of South Mountain alone from morning till late in the afternoon, with five thousand against a large part of Mc-

Clellan's army. He also bore the brunt of the battle of Sharpsburg. He hailed, however, not from Virginia but from North Carolina, and had just been detailed for service in that State. Next in rank after General D. H. Hill was General Lafayette McLaws, who had served with us continually from the Peninsular campaign. His attack of Maryland Heights in the campaign of 1862 was the crowning point in the capture of Harper's

still considered itself, with fair opportunities, invincible, and was ready for any move warranted by good judgment.

While General Lee was reorganizing his army he was also arranging the new campaign. Grant had laid siege to Vicksburg, and Johnston was concentrating at Jackson to drive him away. Rosecrans was in Tennessee and Bragg was in front of him. The force Johnston was concentrating at Jackson gave us no hope that he would have sufficient strength to make any impression upon Grant, and even if he could, Grant was in position to reënforce rapidly and could supply his army with greater facility. Vicksburg was doomed unless we could offer relief by strategic move. I proposed to send a force through East Tennessee to join Bragg and also to have Johnston sent to join him, thus concentrating a large force to move against Rosecrans, crush out his army and march against Cincinnati. That, I thought, was the only way we had to relieve Vicksburg. General Lee admitted the force of my proposition but finally stated that he preferred to organize a campaign into Maryland and Pennsylvania, hoping thereby to draw the Federal troops from the southern points they occupied. After discussing the matter with him for several days I found his mind made up not to allow any of his troops to go west. I then accepted his proposition to make a campaign into Pennsylvania, provided it should be offensive in strategy but defensive in tactics, forcing the Federal army to give us battle when we were in strong position and ready to receive them. One mistake of the Confederacy was in pitting force against force. The only hope we had was to outgeneral the Federals. We were all hopeful and the army was in good condition, but the war had advanced far enough for us to see that a mere victory without decided fruits was a luxury we could not afford. Our numbers were less than the Federal forces, and our resources were limited while theirs were not. The time had come when it was imperative that the skill of generals and the strategy and tactics of war should take the place of muscle against muscle. Our purpose should have been to impair the *morale* of the Federal army and shake Northern confidence in the Federal leaders. We talked on that line from day to day, and General Lee, accepting it as good military view, adopted it as the keynote of the campaign. I suggested that we should

Ferry with its garrison and supplies. With Maryland Heights in our hands Harper's Ferry was untenable. Without Maryland Heights in our possession Jackson's forces on the south side of the Potomac could not have taken the post. At Fredericksburg McLaws held the ground at Marye's Hill with five thousand men (his own and Ransom's division) against forty thou-

have all the details and purposes so well arranged and so impressed upon our minds that when the critical moment should come, we could refer to our calmer moments and know we were carrying out our original plans. I stated to General Lee that if he would allow me to handle my corps so as to receive the attack of the Federal army, I would beat it off without calling on him for help except to guard my right and left, and called his attention to the battle of Fredericksburg as an instance of defensive warfare, where we had thrown not more than five thousand troops into the fight and had beaten off two-thirds of the Federal army with great loss to them and slight loss to my own troops. I also called his attention to Napoleon's instructions to Marmont at the head of an invading army.

A few days before we were ready to move, General Lee sent for General Ewell to receive his orders. I was present at the time and remarked that if we were ever going to make an offensive battle it should be done south of the Potomac — adding that we might have an opportunity to cross the Rappahannock near Culpeper Court House and make a battle there. I made this suggestion in order to bring about a discussion which I thought would give Ewell a better idea of the plan of operations. My remark had the desired effect and we talked over the possibilities of a battle south of the Potomac. The enemy would be on our right flank while we were moving north. Ewell's corps was to move in advance to Culpeper Court House, mine to follow, and the cavalry was to move along on our right flank to the east of us. Thus, by threatening his rear, we could draw Hooker from his position at Fredericksburg. Our movements at the beginning of the campaign were necessarily slow in order that we might be sure of having the proper effect on Hooker and draw him from his position on Stafford Heights opposite Fredericksburg.

Ewell was started off to the valley of Virginia to cross the mountains and move in the direction of Winchester, which was occupied by considerable forces under Milroy. I was moving at the same time east of the Blue Ridge with Stuart's cavalry on my right so as to occupy the gaps from Ashby on to Harper's Ferry. Ewell, moving on through the valley, captured troops and supplies at Winchester, and passed through Martinsburg and Williamsport into Maryland. As I moved

sand, and put more than double his defending forces *hors de combat*, thus making, for his numbers, the best battle of the war. General McLaws was not in vigorous health, however, and was left to command his division in the campaign. He called on General Lee to know why his claims had been overlooked, but I do not know that Lee gave him satisfactory reasons.—J. L.

along the eastern slope of the Blue Ridge we heard from day to day of the movements of Hooker's army, and that he had finally abandoned his position on Stafford Heights, and was moving up the Potomac in the direction of Washington. Upon receipt of that information, A. P. Hill was ordered to draw off from Fredericksburg and follow the movements of General Ewell, save to cross the Potomac at Shepherdstown. When Hill with his troops and well-supplied trains had passed my rear, I was ordered to withdraw from the Blue Ridge, pass over to the west of the Shenandoah and follow the movements of the other troops, only to cross the Potomac at Williamsport. I ordered General Stuart, whom I considered under my command, to occupy the gaps with a part of his cavalry and to follow with his main force on my right, to cross the Potomac at Shepherdstown, and move on my right flank. Upon giving him this order, he informed me that he had authority from General Lee to occupy the gaps with a part of his cavalry, and to follow the Federal army with the remainder. At the same time he expressed his purpose of crossing the river east of the Blue Ridge and trying to make way around the right of the Federal army; so I moved my troops independent of the cavalry, following my orders, crossed at Williamsport, came up with A. P. Hill, in Maryland, and we moved on thence to Chambersburg.

Before we left Fredericksburg for the campaign into Maryland and Pennsylvania, I called up my scout Harrison, and, giving him all the gold he thought he would need, told him to go to Washington City and remain there until he was in possession of information which he knew would be of value to us, and directed that he should then make his way back to me and report. As he was leaving, he asked where he would find me. That was information I did not care to impart to a man who was going directly to the Federal capital. I answered that my command was large enough to be found without difficulty. We had reached Chambersburg on the 27th of June and were remaining there to give the troops rest, when my scout straggled into the lines. He told me he had been to Washington and had spent his gold freely, drinking in the saloons and getting upon confidential terms with army officers. In that way he had gotten a pretty good idea of the general movements of the Federal army and the preparation to give us battle. The moment he heard Hooker had started across the Potomac he set out to find me. He fell in with the Federal army before reaching Frederick—his plan being to walk at night and stop during the day in the

neighborhood of the troops. He said there were three corps near Frederick when he passed there, one to the right, and one to the left, but he did not succeed in getting the position of the other. This information proved more accurate than we could have expected if we had been relying upon our cavalry. I sent the scout to report to General Lee, who was near, and suggested in my note that it might be well for us to begin to look to the east of the Blue Ridge. Meade was then in command of the Federal army, Hooker having been relieved.

The two armies were then near each other, the Confederates being north and west of Gettysburg and the Federals south and south-east of that memorable field. On the 30th of June, we turned our faces toward our enemy and marched upon Gettysburg. The Third Corps, under Hill, moved out first and my command followed. We then found ourselves in a very unusual condition: we were almost in the immediate presence of the enemy with our cavalry gone. Stuart was undertaking another wild ride around the Federal army. We knew nothing of Meade's movements further than the report my scout had made. We did not know, except by surmise, when or where to expect to find Meade, nor whether he was lying in wait or advancing. The Confederates moved down the Gettysburg road on the 30th of June, encountered the Federals on the 1st of July, and a severe engagement followed. The Federals were driven entirely from the field and forced back through the streets of Gettysburg to Cemetery Hill, which had been previously selected as a Federal rallying-point and was occupied by a reserve force of the Eleventh Corps.

Gettysburg lies partly between Seminary Ridge on the west and Cemetery Ridge on the south-east, a distance of about fourteen hundred yards dividing the crests of the two ridges. As General Lee rode to the summit of Seminary Ridge and looked down upon the town he saw the Federals in full retreat and concentrating on the rock-ribbed hill that served as a burying-ground for the city. He sent orders to Ewell to follow up the success if he found it practicable and to occupy the hill on which the enemy was concentrating. As the order was not positive but left discretion with General Ewell, the latter thought it better to give his troops a little rest and wait for more definite instructions. I was following the Third Corps as fast as possible, and as soon as I got possession of the road went rapidly forward to join General Lee. I found him on the summit of Seminary Ridge watching the enemy concentrate on the opposite hill. He pointed out their position to me. I took my glasses and made as careful a survey as I

GENERAL ROBERT E. LEE.

could from that point. After five or ten minutes I turned to General Lee and said :

"If we could have chosen a point to meet our plans of operation, I do not think we could have found a better one than that upon which they are now concentrating. All we have to do is to throw our army around by their left and we shall interpose between the Federal army and Washington. We can get a strong position and wait, and if they fail to attack us we shall have everything in condition to move back to-morrow night in the direction of Wash-

ington, selecting beforehand a good position into which we can place our troops to receive battle next day. Finding our object is Washington or that army, the Federals will be sure to attack us. When they attack, we shall beat them, as we proposed to do before we left Fredericksburg, and the probabilities are that the fruits of our success will be great."

"No," said General Lee; "the enemy is there, and I am going to attack him there."

I suggested that such a move as I proposed would give us control of the roads leading to Washington and Baltimore, and reminded General Lee of our original plans. If we had fallen behind Meade and had insisted on staying between him and Washington, he would have been compelled to attack and would have been badly beaten. General Lee answered, "No; they are there in position, and I am going to whip them or they are going to whip me." I saw he was in no frame of mind to listen to further argument at that time, so I did not push the matter, but determined to renew the subject the next morning. It was then about five o'clock in the afternoon.

On the morning of the 2d I joined General Lee and again proposed the move to Meade's left and rear. He was still unwilling to consider the proposition, but soon left me and rode off to see General Ewell and to examine the ground on our left with a view to making the attack at that point. After making the examination and talking to General Ewell, he determined to make the attack by the right, and, returning to where I was, announced his intention of so doing. His engineer officers had been along the line far enough to find a road by which the troops could move and be concealed from the Federal signal stations.

About eleven o'clock on the morning of the 2d he ordered the march, and put it under the conduct of his engineer officers, so as to be assured of their moving by the best route and encountering the least delay in reaching the position designated by him for the attack on the Federal left, at the same time concealing the movements then under orders from view of the Federals.

McLaws's division was in advance, with Hood following. After marching some distance there was a delay in front, and I rode forward to ascertain the cause, when it was reported to me that part of the road just in advance of us was in plain view of the Federal signal station on Round Top. To avoid that point the direction of the troops was changed. Again I found there was some delay, and ordering Hood's division, then in the rear, to move on and double with the division in front, so as to save as much time as possible, I went forward again to see the cause of the delay. It seemed there was doubt again about the men being concealed, when I stated that I could see the signal station, and there was no reason why they could not see us. It seemed to me useless, therefore, to delay the troops any longer with the idea of concealing the move, and the two divisions moved on. As the line was deployed I rode along from left to right, examining the Federal position and putting my troops in the best position we could find. General Lee at the same time gave orders for the attack to be made by my right — following up the direction of the Emmetsburg road toward the Cemetery Ridge, holding Hood's left as well as could be toward the Emmetsburg road, McLaws to follow the movements of Hood, attacking at the Peach Orchard the Federal Third Corps, with a part of R. H. Anderson's division following the movements of McLaws to guard his left flank. As soon as the troops were in position, and we could find the points against which we should march and give the guiding points, the advance was ordered — at half-past three o'clock in the afternoon. The attack was

made in splendid style by both divisions, and the Federal line was broken by the first impact. They retired, many of them, in the direction of Round Top behind bowlders and fences, which gave them shelter, and where they received reënforcements.

This was an unequal battle. General Lee's orders had been that when my advance was made, the Second Corps, on his left, should move and make a simultaneous attack; that the Third Corps should watch closely and engage so as to prevent heavy massing in front of me. Ewell made no move at all until about eight o'clock at night, after the heat of the battle was over, his line having been broken by a call for one of his brigades somewhere else. Hill made no move whatever, save of the brigades of his right division that were covering our left.

When the battle of the 2d was over, General Lee pronounced it a success, as we were in possession of ground from which we had driven the Federals and had taken several field pieces. The conflict had been fierce and bloody, and my troops had driven back heavy columns and had encountered a force three or four times their number,* but we had accomplished little toward victorious results. Our success of the first day led us into battle on the 2d, and the battle on the 2d doubtless led us into the terrible and hopeless slaughter on the 3d.

On the night of the 2d, I sent to our extreme right to make a little reconnoissance in that direction, thinking General Lee might yet conclude to move around the Federal left. The morning of the 3d broke clear and indicated a day on which operations would not be interrupted by the elements. The Confederate forces still occupied Seminary Ridge, while the Federals occupied the range stretching from Round Top to Cemetery Hill and around Culp's Hill. The position of the Federals was quite strong, and the battle of the 2d had concentrated them so that I considered an attack from the front more hazardous than the battle on the 2d had been. The Federals were concentrated, while our troops were stretched out in a long, broken, and thus a weak line. However, General Lee hoped to break through the Federal line and drive them off. I was disappointed when he came to me on the morning of the 3d, and directed that I should renew the attack against Cemetery Hill, probably the strongest point of the Federal line. He had already ordered Pickett's division, which had been left at Chambersburg to guard our supply trains, up for that purpose. In the mean-

time the Federals had placed batteries on Round Top in position to make a raking fire against troops attacking the Federal front. Meade knew that if the battle was renewed it would be virtually over the same ground as my battle of the 2d. I stated to General Lee that I had been examining the ground over to the right, and was much inclined to think the best thing was to move to the Federal left.

"No," he said; "I am going to take them where they are on Cemetery Hill. I want you to take Pickett's division and make the attack. I will reënforce you by two divisions of the Third Corps."

"That will give me fifteen thousand men," I replied. "I have been a soldier, I may say, from the ranks up to the position I now hold. I have been in pretty much all kinds of skirmishes, from those of two or three soldiers up to those of an army corps, and I think I can safely say there never was a body of fifteen thousand men who could make that attack successfully."

The General seemed a little impatient at my remarks, so I said nothing more. As he showed no indication of changing his plan, I went to work at once to arrange my troops for the attack. Pickett was put in position and received directions for the line of his advance as indicated by General Lee. The divisions of the Third Corps were arranged along his left with orders to take up the line of march as Pickett passed before them in short echelon. We were to open with our batteries, and Pickett was to move out as soon as we silenced the Federal batteries. The artillery combat was to begin with the rapid discharge of two field pieces as our signal. As soon as the orders were communicated along the line, I sent Colonel E. P. Alexander (who was commanding a battalion of artillery and who had been an engineer officer) to select carefully a point from which he could observe the effect of our batteries. When he could discover the enemy's batteries silenced or crippled, he should give notice to General Pickett, who was ordered, upon receipt of that notice, to move forward to the attack. When I took Pickett to the crest of Seminary Ridge and explained where his troops should be sheltered, and pointed out the direction General Lee wished him to take and the point of the Federal line where the assault was to be made, he seemed to appreciate the severe battle he was to encounter, but was quite hopeful of success. Upon receipt of notice, he was to march over the crest of the hill down the gentle slope and up the rise opposite the Federal stronghold. The distance was about fourteen hundred yards, and for most of the way the Federal batteries would have a rak-

A DISPATCH BEARER.

ing fire from Round Top, while the sharpshooters, artillery, and infantry would subject the assaulting column to a terrible and destructive fire. With my knowledge of the situation, I could see the desperate and hope-

less nature of the charge and the cruel slaughter it would cause. My heart was heavy when I left Pickett. I rode once or twice along the ground between Pickett and the Federals, examining the positions and study-

ing the matter over in all its phases so far as we could anticipate.

About one o'clock everything was in readiness. The signal guns broke the prevailing stillness, and immediately a hundred and fifty Confederate cannon burst into a deafening roar, which was answered by a thunder almost as great from the Federal side. From both sides the shells were hurled and burst as

BRIGADIER-GENERAL RICHARD B. GARNETT, KILLED JULY 3D.

the great artillery combat proceeded. The destruction was, of course, not great; but the thunder on Seminary Ridge, and the echo coming back from the Federals, showed that both sides were ready. The armies seemed like mighty wild beasts growling at each other and preparing for a death struggle. For an hour or two the fire was continued, and met such steady response on the part of the Federals, that it seemed less effective than we had anticipated. I sent word to Alexander that unless he could do something more, I would not feel warranted in ordering the troops forward. After a little, some of the Federal batteries ceased firing, possibly to save ammunition, and Alexander thought the most suitable time for the advance had come. He sent word to Pickett, and Pickett rode to my headquarters. As he came up he asked if the time for his advance had come. I was convinced that he would be leading his troops to needless slaughter, and did not speak. He repeated the question, and without opening my lips, I bowed in answer. In a determined voice Pickett said: "Sir, I shall lead my division forward." He then remounted his horse and rode back to his command. I mounted my horse and rode to a point where I could observe the troops as they marched forward. Colonel Alexander had set aside a battery of seven guns to advance with Pickett, but General Pendleton, from whom they were borrowed, recalled them just before the charge was ordered. Colonel Alexander told me of the seven guns which had been removed,

and that his ammunition was so low he could not properly support the charge. I ordered him to stop Pickett until the ammunition could be replenished, and he answered, "There is no ammunition with which to replenish." In the hurry he got together such guns as he could to move with Pickett.

It has been said that I should have exercised discretion and should not have sent Pickett on his charge. It has been urged that I had exercised discretion on previous occasions. It is true that at times when I saw a certainty of success in another direction, I did not follow the orders of my general, but that was when he was not near and could not see the situation as it existed. When your chief is away, you have a right to exercise discretion; but if he sees everything you see, you have no right to disregard his positive and repeated orders. I never exercised discretion after discussing with General Lee the points of his orders, *and* when after discussion he had ordered the execution of his policy. I had offered my objections to Pickett's battle and had been overruled, and I was in the immediate presence of the commanding general when the order was given for Pickett to advance.

Gettysburg was one of the saddest days of my life. I foresaw what my men would meet and would gladly have given up my position rather than share in the responsibilities of that day. It was thus I felt when Pickett at the head of forty-nine hundred brave men marched over the crest of Seminary Ridge and began his descent of the slope. As he passed me he rode gracefully, with his jaunty cap raked well over on his right ear and his long auburn locks, nicely dressed, hanging almost to his shoulders. He seemed rather a holiday soldier than a general at the head of a column which was about to make one of the grandest, most desperate assaults recorded in the annals of wars. Armistead and Garnett, two of his brigadiers, were veterans of nearly a quarter of a century's service. Their minds seemed absorbed in the men behind, and in the bloody work before them. Kemper, the other brigadier, was younger but had experienced many severe battles. He was leading my old brigade that I had drilled on Manassas plains before the first battle on that noted field. The troops advanced in well-closed ranks and with elastic step, their faces lighted with hope. Before them lay the ground over which they were to pass to the point of attack. Intervening were several fences, a field of corn, a little swale running through it and then a rise from that point to the Federal stronghold. As soon as Pickett passed the crest of the hill, the Federals had a clear view and opened their batteries, and as he descended the eastern

slope of the ridge his troops received a fearful fire from the batteries in front and from Round Top. The troops marched steadily, taking the fire with great coolness. As soon as they passed my batteries I ordered my artillery to turn their fire against the batteries on our right then raking my lines. They did so, but did not force the Federals to change the direction of their fire and relieve our infantry. As the troops were about to cross the swale I noticed a considerable force of Federal infantry moving down as though to flank the left of our line. I sent an officer to caution the division commanders to guard against that move, at the same time sending another staff officer with similar orders so as to feel assured the order would be delivered. Both officers came back bringing their saddles, their horses having been shot under them. After crossing the swale, the troops kept the same steady step, but met a dreadful fire at the hands of the Federal sharpshooters; and as soon as the field was open, the Federal infantry poured down a terrific fire which was kept up during the entire assault. The slaughter was terrible, the enfilade fire of the batteries on Round Top being very destructive. At times one shell would knock down five or six men. I dismounted to relieve my horse and was sitting on a rail fence watching very closely the movements of the troops. Colonel Freemantle, who had taken a position behind the Third Corps where he would be out of reach of fire and at the same time have a clear view of the field, became so interested that he left his position and came with speed to join me. Just as he came up behind me, Pickett had reached a point between his and the

Federal lines. A pause was made to close ranks and mass for the final plunge. The troops on Pickett's left, although advancing, were evidently a little shaky. Colonel Freemantle, only observing the troops of Pickett's command, said to me, "General, I would not

MAJOR-GENERAL WILLIAM D. PENDER, WOUNDED JULY 2D,
DIED JULY 18TH.

have missed this for anything in the world." He believed it to be a complete success. I was watching the troops supporting Pickett and saw plainly they could not hold together ten minutes longer. I called his attention to the wavering condition of the two divisions of the Third Corps, and said they would not hold, that Pickett would strike and be crushed and the attack would be a failure. As Pickett's division concentrated in making the final assault, Kemper fell severely wounded. As the division threw itself against the Federal line Garnett fell and expired. The Confederate flag was planted in the Federal line, and immediately Armistead fell mortally wounded at the feet of the Federal soldiers. The wavering divisions then seemed appalled, broke their ranks, and retired. Immediately the Federals swarmed around Pickett, attacking on all sides, enveloped and broke up his command, having killed and wounded more than two thousand men in about thirty minutes. They then drove the fragments back upon our lines. As they came back I fully expected to see Meade ride to the front and lead his forces to a tremendous counter-charge. Sending my staff officers to assist in collecting the fragments of my command, I rode to my line of batteries, knowing they were all I had in front of the impending attack, resolved to drive it back or sacrifice my last gun and man. The Federals were advancing a line of skirmishers which I thought was the advance of their charge. As soon as the line of skirmishers came within reach of our guns the batteries opened again and their

PICKETT'S CHARGE. (BY EDWIN FORBES, AFTER HIS SKETCH MADE AT THE TIME.)

fire seemed to check at once the threatened advance. After keeping it up a few minutes the line of skirmishers disappeared, and my mind was relieved of the apprehension that Meade was going to follow us.

General Lee came up as our troops were falling back and encouraged them as well as he could; begged them to re-form their ranks and reorganize their forces, and assisted the staff-officers in bringing them all together again. It was then he used the expression that has been mentioned so often:

"It was all my fault; get together, and let us do the best we can toward saving that which is left us."

As our troops were driven back from the general assault an attack was made on my extreme right by several squadrons of cavalry, which succeeded in breaking through our line of pickets. They were met by counter-move of the Ninth Georgia and the well-directed fire of Captain Bachman's battery and driven back, the Eleventh and Fifty-ninth Georgia regiments joining in the counter-move.

Finding that Meade was not going to follow us, I prepared to withdraw my line to a better defensive position. The batteries were withdrawn well over Seminary Ridge, and orders were sent to the right for McLaws's and Hood's divisions to be withdrawn to corresponding positions. The armies remained in position, the Confederates on Seminary Ridge extending around Gettysburg, the left also drawn back, the Federals on Cemetery Ridge, until the night of the 4th, when we took up the march in retreat for Virginia.

That night, while we were standing round a little fire by the roadside, General Lee said again the defeat was all his fault. He said to me at another time, "You ought not to have made that last attack." I replied, "I had my orders, and they were of such a nature there was no escape from them." During that winter, while I was in East Tennessee, in a letter I received from him he said, "If I only had taken your counsel even on the 3d, and had moved around the Federal left, how different all might have been."

The only thing Pickett said of his charge was that he was distressed at the loss of his command. He thought he should have had two of his brigades that had been left in Virginia; with them he felt that he would have broken the line.

While I was trying to persuade General Lee to turn the Federal left on the 1st of July, Halleck telegraphed Meade as follows:

"WASHINGTON, D. C., July 1, 1863.

"The movements of the enemy yesterday indicate his intention to either turn your left or to cover himself by the South Mountain and occupy Cumberland Valley. Do not let him draw you too far to the east."

VOL. XXXIII.—81.

Again on the same day:

"Your tactical arrangements for battle seem good so far as I can judge from my knowledge of the character of the country. But in a strategic view, are you not too far east? And may not Lee attempt to turn your left and cut you off from Frederick? Please give your full attention to this suggestion."

The next day, just thirty minutes before my assault, General Meade telegraphed General Halleck at 3 P. M.:

"If I find it hazardous to do so [meaning to attack], or am satisfied that the enemy is endeavoring to move to my rear and interpose between me and Washington, I shall fall back to my supplies at Westminster."

From this we know that the ground of the Gettysburg cemetery could have been occupied without the loss of a man, yet even at this late day, some of the Virginians, not satisfied with the sacrifice already made, wish that I, who would and could have saved every man lost at Gettysburg, should now be shot to death.

If we had made the move around the Federal left, and taken a strong position, we should have dislodged Meade without a single blow; but even if we had been successful at Gettysburg, and had driven the Federals out of their stronghold, we should have won a fruitless victory, and returned to Virginia conquered victors. The ground they occupied would have been worth no more to us than the ground we were on. What we needed was a battle that would give us decided fruits, not ground that was of no value. I do not think there was any necessity for giving battle at Gettysburg. All of our cavalry was absent, and while that has been urged by some as a reason why the battle should have been made at once, to my mind it was one of the strongest reasons for delaying the battle until everything was well in hand. The cause of the battle was simply General Lee's determination to fight it out from the position in which he was at that time. He did not feel that he was beaten on the second day, but that he was the victor, and still hoped he would be able to dislodge Meade; but he made a mistake in sending such a small number of men to attack a formidable force in position of great natural strength, reënforced by such temporary shelter as could be collected and placed in position to cover the troops. Lee's hope in entering the campaign was that he would be in time to make a successful battle north of the Potomac, with such advantages as to draw off the army at Vicksburg as well as the Federal troops at other points.

I do not think the general effect of the battle was demoralizing, but by a singular

coincidence our army at Vicksburg surrendered to Grant on the 4th, while the armies of Lee and Meade were lying in front of each other, each waiting a movement on the part of the other, neither victor, neither vanquished. This surrender, taken in connection with the Gettysburg defeat, was, of course, very discouraging to our superior officers, though I do not know that in rank and file it was felt as keenly. For myself, I felt that our last hope was gone, and that it was now only a question of time with us. When, however, I found that Rosecrans was moving down toward Georgia against General Bragg, I thought it possible we might recover some of our lost prospects by concentrating against Rosecrans, destroying his army, and advancing through Kentucky.

General Lee evidently felt severely mortified and hurt at the failure, so much so that at times he was inclined to listen to some of those who claimed to be his friends, and to accept their proposition to find a scapegoat. He resisted them, however, and seemed determined to leave the responsibility on his own hands.

For several reasons I will take occasion here to answer some serious charges that have been made against me by men who claim to have been the friends of General Lee.

Mr. Jefferson Davis, in his "Rise and Fall of the Confederate Government," quotes from a memorial address the old story of the Rev. W. N. Pendleton (page 441, Vol. II.):

"The ground south-west of the town was carefully examined by me after the engagement on July 1st. Being found much less difficult than the steep ascent fronting the troops already up, its practicable character was reported to our commanding general. He informed me that he had ordered Longstreet to attack on that front at sunrise the next morning. And he added to myself, 'I want you to be out long before sunrise, so as to reëxamine and save time.'

"He also desired me to communicate with General Longstreet as well as with himself. The reconnoissance was accordingly made as soon as it was light enough on the 2d, and made through a long distance—in fact, very close to what there was of the enemy's line. No insuperable difficulty appearing, and the marching up far off the enemy's reënforcing columns being seen, the extreme desirableness of immediate attack there was at once reported to the commanding general, and according to his wish, message was also sent to the intrepid but deliberate corps commander, whose sunrise attack there had been ordered. There was, however, unaccountable delay. My own messages went repeatedly to General Lee, and his I know was urgently pressed on General Longstreet until, as I afterwards learned from officers who saw General Lee, as I could not at the time, he manifested extreme displeasure with the tardy corps commander. That hard-fighting soldier, to whom it had been committed there to attack early in the day, did not in person reach the commanding general and with him ride to a position whence to view the ground and see the enemy's arriving masses until twelve o'clock, and his column was not up and ready for the assault until four P. M.

All this, as it occurred under my personal observation, it is nothing short of imperative duty that I should thus fairly state."

Mr. Davis indorses the statement thus:

"For the reasons set forth by General Pendleton, whose statement in regard to a fact coming under his personal observation none who know him will question, preparations for a general engagement were unfortunately delayed until the afternoon instead of being made at sunrise; then troops had been concentrated, and Round Top, the commanding position unoccupied in the morning, had received the force which inflicted such disaster on our assaulting columns. The question as to the responsibility for this delay has been so fully discussed in the 'Southern Historical Society Papers' as to relieve me from the necessity of entering into it."

As General Pendleton's lecture was the capital upon which it was proposed to draw funds for a memorial church, it was natural, perhaps, that Mr. Davis should *as a sentiment* claim the statements made as beyond question. Most Virginia writers on this subject have taken up and followed the false scent announced by Mr. Pendleton. Outside that State, I believe Mr. Davis and General Wilcox are the only persons who do not spurn it as false. Facts connected with this battle have been so distorted and misrepresented that a volume of distinct maps must be written in order to make a demonstration, to the letter, of all its features.

General C. M. Wilcox, in an article in the September number, 1877, of the "Southern Historical Society Papers," refers to the order for early attack, viz.:

"It has been asserted that General Longstreet was ordered to attack at daylight or early the next morning. Of this I have no knowledge personally, but am inclined to believe that he was so ordered."

But from the *official accounts* of Generals Pendleton and Wilcox* we see that the right of General Lee's army was not deployed as far as the Fairfield road on the 1st of July, that General Pendleton did not pass beyond this road, and only noted the location of the ridge on the right from his position on the Fairfield road especially as likely to be important "toward a flank movement." With this idea in his mind he leaves us to infer that he left our right and moved over to our left to supervise the posting of artillery battalions just then coming up. Soon after General Pendleton passed from about the Fairfield road to our left, the division of General R. H. Anderson,—of the Third Corps,—led by the brigade of General C. M. Wilcox, filed off to the right from the Chambersburg road, marched in an oblique direction toward the Fairfield road,

* The text of these reports is omitted here for want of space.

where it was halted for the night, lying in bivouac till the next day, the brigade of Wilcox being on picket or guard service during the night about a mile farther to the right. In the absence of other evidence, one might be at a loss to know which of these accounts was intended in the Pickwickian sense, but the account of General R. H. Anderson, who was guileless and truthful, supports the official reports. General A. A. Humphreys (of the other side), late chief of the United States Corps of Engineers, a man whose entire life and service were devoted to official accuracy, gives similar evidence in his official report.

All the subordinate reports on the Confederate side confirm the account by General Anderson, while the reports of subordinate officers on the Federal side conform to that of General Humphreys. It is conclusive therefore that the Confederates occupied no ground east of the Fairfield road till R. H. Anderson's division advanced on the morning of the 2d at ten to find its position on the right of the Third Corps.

When it is remembered that my command was at the close of the first day's fight fifteen to twenty miles west of the field, that its attack as ordered was to be made along the east side of the Emmettsburg road, that no part of General Lee's army touched that road till 10 A. M. of the 2d, that up to that hour it was in possession of the Federals, and that their troops had been marching in by that road from early on the 1st till 10 A. M. on the 2d, it will be seen that General Pendleton's reconnoissance on the 1st was made, if made at all, by his passing through the Federal lines on the afternoon of the 1st and again on the morning of the 2d. If he had there delivered his memorial lecture, Sickles's corps would have been driven off in confusion, to the great benefit of the Confederate cause.

General Wilcox confesses want of personal information of the order for daylight or early attack, but expresses his confidence that the order was given. That is, he, occupying our extreme right, on picket on the 1st, at a point considerably west of the Emmettsburg road, believes that General Lee ordered troops some fifteen or twenty miles further west, and yet on the march, to pass his picket guard in the night to its point of attack, east of the Emmettsburg road, through the Federal lines, to make a daylight attack east of the Emmettsburg road. While I am prepared to admit that General Lee ordered, at times, desperate battles, I cannot admit that he, blindfold, ever led or ordered his next in rank, also blindfold, into night marches through the enemy's lines to gain position and make a battle at daylight next morning.

In articles formerly published on this charge of Mr. Pendleton, masses of evidence were adduced showing that my column when ordered to the right, east of the Emmettsburg road, was conducted by General Lee's engineer officer; that when halted under the conduct of that officer I doubled the rear division on the leading one so as to save time; that my arrangements were promptly made, and that my attack was made many hours before any of our other troops were ready to obey their orders to coöperate. As I was the only one prepared for battle, I contended against the Federal army throughout the contest with two divisions and some misguided brigades sent to cover my left.

Colonel Taylor, of General Lee's staff, takes exception to the delay in the attack of Pickett on the last day under the impression that had I attacked earlier and before Johnson was driven from the Federal right, the latter might have held his ground longer and to some advantage to the Confederates. He seems to lose sight of the fact that General Lee, not I, was commanding our left under Johnson, and that he alone could order concert of action. On the 2d, notwithstanding his orders to move in concert with my attack at 4 P. M., Johnson did not go in till eight at night, long after my battle was ended. Colonel Taylor thinks the forlorn hope should have gone in sooner. The universal opinion now is that it should not have gone in at all; and, as already stated, that was the opinion General Lee expressed soon after the battle.

Some of our North Carolina troops seem to consider the less conspicuous part given them a reflection upon them as soldiers of true mettle and dash. This sensitiveness is not well founded. Every officer of experience knows that the best of veteran soldiers, with bloody noses, from a fresh battle, are never equal to those going in fresh in their first stroke of the battle. Had Pickett's men gone through the same experience of the other troops on the 1st, they could not have felt the same zest for fighting that they did coming up fresh and feeling disparaged that the army had won new laurels in their absence. There is no doubt that the North Carolinians did as well as any soldiers could have done under the circumstances. I can truthfully attest that the old North State furnished as fine and gallant troops as any that fought in the Confederate ranks — and that is saying as much as can be said for soldiers. They certainly made sufficient sacrifice, and that was all we had left to do on that day.

DURING the Franco-Prussian war I kept a map of the field of operations with col-

ored pegs, that were moved from day to day to indicate the movements of the two armies. Bazaine had been driven to shelter at Metz, McMahon had been driven back to the route leading from Paris to Metz and seemed in doubt whether he would go to Paris or to Bazaine's relief. He suffered himself to be forced north of the route between these points. On the morning that the wires brought us that information two or three of the French Creoles of New Orleans visited my office to inquire my views of the movements then proceeding. I replied, "McMahon's army will be prisoners of war in ten days." They were very indignant and stated that I was a republican and in sympathy with the Prussians. My reply was that I had only given them my solution of a military problem. The Prussians were on the shorter route to Paris or to Metz, so that if McMahon should attempt to move in either direction the Prussians, availing themselves of the shorter

lines, would interpose and force McMahon to attack, but he had already been so beaten and demoralized, that he could not be expected to make a successful attack and would therefore be obliged to surrender. If he had gone directly to Paris before giving up his shorter route, it is possible that he could have organized a succoring army for the relief of Metz.

Had we interposed between Meade and Washington our army in almost as successful prestige as was that of the Prussians, Meade would have been obliged to attack us wherever we might be pleased to have him. He would have been badly beaten like the French, and the result would have been similar.

I do not mean to say that two governments would have been permanently established; for I thought before the war, and during its continuance, that the peoples would eventually get together again in stronger bonds of friendship than those of their first love.

James Longstreet.

THE FINDER OF THE ANTIETAM ORDER OF GENERAL LEE.

IN THE CENTURY for November appear two communications, one by myself, and one from the late General McClellan relating to a pension for the widow of John B. Mitchell, late of Company "F" Twenty-seventh Indiana Volunteers, the finder of the famous Antietam order of General Lee.

Neither the soldier nor the widow has ever filed a claim for pension, and any seeming failure of recognition is not due to neglect on the part of the Pension Office.

S. Colgrove.

WASHINGTON, D. C., November 15, 1886.

THE BAILING OF JEFFERSON DAVIS.

SHORTLY after daybreak of a morning near the end of June, 1865, Horace Greeley came to the house of George Shea (then Corporation Attorney, and afterwards Chief-justice of the Marine Court), in New York. His errand was urgent. The preceding day he had received a letter, dated June 22, from Mrs. Varina Davis, whose husband, Jefferson Davis, was a prisoner at Fort Monroe. The "Bureau of Military Justice," headed by General Joseph Holt, had already charged him with guilty knowledge concerning the assassination of Lincoln. Mrs. Davis wrote from Savannah, and implored Greeley to obtain if possible a speedy public trial of Davis on this charge, and on any inferred charge of cruelty to prisoners of war. Greeley could not believe that Davis had anything to do with the assassination. He added that Davis had personally received from Francis P. Blair, in the preceding winter, sufficient assurance of Lincoln's kindly intentions toward the

South. He then asked Mr. Shea to interest himself professionally on Davis's behalf, and said: "We can have with us those with whom you have been in confidential relations during the last two years." Shea said that unless the Government were willing to abandon the charge against Wirz for cruelty to prisoners, it could not overlook his superior, Davis, popularly supposed to be responsible. He should hesitate to act as counsel, if the case came before a military tribunal. Greeley said he did not know Mr. Davis, and Shea said: "Neither do I. But I know those who are intimate with him; and his reputation among them is universal for kindness of heart amounting, in a ruler, almost to weakness." Greeley feared that the head of the Confederacy could not be held blameless, and that Wirz's impending trial had a "malign aspect" for Davis.

"If the contrary cannot be made to appear," said Shea, "the case is hopeless."

At last it was agreed that Shea should consult with common friends, then in official power, and with representative citizens, in order to assist Davis, should the charge of

cruelty prove unfounded. It was also agreed to take into confidence only pronounced Republicans.

Such was the extraordinary conference, held in the first light of morning, between the chief journalist of the Republican party and his friend, an uncompromising Democrat, with the object of aiding Davis; a scheme which, had it been known, would have roused a storm of passionate protest in the North.

Shea had always been on intimate terms with Greeley, who had known him from childhood.* This brought him into friendly association with abolition leaders; and as he was himself a strong Democrat, he was naturally sought out as the person most likely to conduct successfully the difficult task in view. Charles O'Connor was subsequently engaged to defend Davis. Shea was the attorney of record.

I must now go back a little. In July, 1864, Greeley visited Shea at Brier Cliff, on the Hudson, respecting the proposed conference with Clement C. Clay, Jacob Thompson, and James P. Holcombe, on the Canada side of Niagara Falls, with a view to securing peace, based upon recognition of freedom for the slaves. Shea tried to dissuade him from taking part in it, since it was not likely that the gentlemen named had definite authority to negotiate. The meeting, as every one is aware, came to nothing. Shea was now to be associated with Greeley in more effectual efforts to realize fully the peace concluded by the war.

Late in March, 1865, Shea went to Hilton Head, and thence to Charleston. One of his objects, though not at first the chief one, was to meet certain Republican leaders whom he could not visit at the North without, perhaps, exciting observation and inquiry. They were going down to Charleston on the *Arago*, to celebrate the restoration of the United States flag above Fort Sumter. He preceded them, and was the guest of General Q. A. Gillmore, then commanding in that department. He had just come from Hilton Head on the flagship with General Gillmore, when the *Arago* arrived and anchored outside the bar at day-break of Good Friday, April 14th. Just then came the news, through Sherman's headquarters, of Lee's surrender; and the flagship,

steaming out, announced it to the party on board the *Arago*, among whom were Henry Ward Beecher, Wm. Lloyd Garrison, Hon. Henry Wilson, and General Joseph Holt. A scene of great enthusiasm ensued. After the ceremony of raising the flag on Sumter, and Beecher's oration, Shea went with Henry Wilson to the mansion, corner of Meeting street and fronting the Battery at Charleston. The spirit of exultation had received a check in the news of that morning. Many thought that, the war being ended, the Sumter affair was not as fitting as it would have been while hostilities continued.

The sentiment of magnanimity sprang into life at once. Wilson and Shea thought this opportunity propitious, and began to consider whether it might not be fostered and turned to practical account. They were together Saturday and Sunday. Wilson expressed joy at the prospect that, since Congress was not in session, peace could be arranged by military armistice, and the country adjusted to new conditions without bitter political debate. They agreed that the most powerful men in bringing about such a result would be John A. Andrew, Gerrit Smith, and Greeley. Thaddeus Stevens, they thought, would prove intractable were Seward's original view of the situation, now precipitated, to be acted upon.†

The plan which Wilson and Shea were now revolving looked towards bringing together representative men of the North and South, with the idea of carrying out that view. On Sunday, Shea had a long talk with Garrison, while walking through the streets of the city, lined with shattered edifices. Garrison, Mr. Shea says, was moved by the sight, and alluded to the fact that this same city had once burnt him in effigy and that a price had been offered for his head in the South. He said he had none but good wishes for Charleston, and "mourned" to see that of its "great buildings not one stone was left upon another." Shea then urged upon him that he extend this feeling of charity to the entire South and assist in bringing into coöperation with Northern men the Southern leaders, so as to effect speedily a good understanding and the

* See Greeley's "Recollections of a Busy Life."

† January 22, 1861, Senator Fitch of Indiana moved that the President of the Senate should fill vacancies on the committees, caused by the withdrawal of Senators Jefferson Davis, Yulee, Fitzpatrick, Clay, and Mallory, whose States had seceded. In the debate that followed, Seward said: "I am utterly opposed, however, Mr. President, to this transaction. . . . I am for leaving those seats here for those Senators or for other Senators from the States which they represent, *to be resumed at their own time and at their good pleasure.*"

At that time there was much discussion in Congress

as to whether the withdrawal of Southern members should be formally recognized, lest by such action the right of secession should be tacitly conceded. January 12, 1861, Seward had said in a speech on the state of the Union: "The Union can be dissolved *not by secession, with or without force*, but only by the voluntary consent of the people of the United States, in the manner prescribed by the Constitution of the United States." Taking these two utterances together, it is plain that Seward's view then was that under no circumstances could Southern States be regarded as out of the Union, and that they should always be free to resume their seats in Congress.—G. P. L.

resumption of peaceful works by the whole people. Garrison appeared anxious and inquiring. Shea expressed his belief that Wilson and Andrew would coöperate in such a plan.* Other conversations followed while the party (which left Charleston on Monday) was on its way to Hilton Head. But there it received the dire news of Lincoln's assassination. Everything was now thrown into doubt, though Wilson still had great hopes of Johnson's acting wisely. The steamer *Sueva Nada* was at once ordered to New York with those who wished to go. When she reached that port on April 26th, it was learned that she would stop first at Brooklyn, to land Mr. Beecher. Wilson, eager to get to Washington, left the vessel by a small boat and was rowed directly to Jersey City.

Within a few days he returned from the capital and, having first called on Greeley, came to Shea's house. There he told of his conversations with the new President. He appeared wholly disheartened. Johnson, he had found, wanted to adopt a plan for making all Southerners of former social position suppliants to him; and when every Southerner owning property of more than \$40,000 value should be forced, as a condition of clemency, to give up the excess for the benefit of the poor in the South, the President thought their aristocracy would no longer "have a heel to crush people with." From that hour Wilson and Johnson diverged; and combinations were now formed to further a magnanimous policy, if need were, in opposition to the President. To that end Shea reopened negotiations with Governor Andrew, and went to Boston to see him.

This, then, was the situation when Greeley received Mrs. Davis's letter and talked with Shea in the gray dawn of that June morning. Two months afterwards Greeley had another letter from Mrs. Davis, evidently intended for publication. This caused him to write to Shea, August 28th, 1865, a letter which indicated a marked change in Greeley's disposition towards Davis, and that he was becoming convinced of Davis's moral responsibility for the crimes against prisoners. Dining with Greeley the next evening, † Shea undertook to get evidence that Davis was free from blame on this score.

He at once went to see Francis P. Blair, whom he found at his country-seat, Silver Springs, Maryland. Justice Shea has narrated to me the substance of the interview which took place there, and I give it from his dictation.

* Shea visited Garrison at Roxbury the following summer, but found him changed in mind, and urgent for the extreme punishment of Davis. Garrison said:

CHIEF-JUSTICE SHEA'S NARRATIVE.

ON my arriving at the cottage which Mr. Blair then occupied, his mansion having been destroyed by Confederate troops, Mr. Blair said that we would walk out in the grounds, so that our conversation might be entirely free. He said, "I believe that Mr. Davis has not been allowed to appoint counsel." I said, "No; that a letter had been sent by Mr. O'Connor to Davis at Fortress Monroe; that we understood that an answer had been returned by Mr. Davis, but had been intercepted and stopped in the State Department."

Blair.—"You surely mean the War Department."

Shea.—"No, sir. The State Department seems to take an irregular and unusual interest concerning Mr. Davis personally."

Mr. Blair looked puzzled for some time; then smiled as if something occurred to him confirming my statement.

Shea.—"One of the objects, though quite incidental, of my visit to you, Mr. Blair, is that the counsel already selected by Mr. Davis's friends should at a proper time be allowed access to him. This is a right which the Constitution gives to every citizen accused, and unless the case of a prisoner of war is an exception, it should not be denied in a case so important and conspicuous as that of Mr. Davis. Your intimacy with President Johnson and the confidence which he has in your friendship, and respect for your judgment, point you out to Mr. Greeley, Mr. Wilson, Gerrit Smith, and Governor Andrew as the one person able, and likely willing, to aid their plan for a comprehensive magnanimity towards the South. They are sure you could not have approved of President Johnson's impolitic and unjust amnesty of last May."

Blair (after a few moments' silence).—"Mr. Shea, I am already made aware that you are in the confidence of those gentlemen, and represent them. Have you not seen the Chief-justice also?"—with a significant look.

Shea.—"I certainly have, and have come to confer with you upon what I consider necessary inferences from the conversation which I had with him at his house last month. It is clear that he considers the late armed strife between the States as an open and public war, and that no charge of treason attaches to any one engaged in it on the part of the Southern States."

Mr. Blair.—"I heard you had a talk together; but did he go that length with you?"

Shea.—"No; not in strict terms. But let me relate the fact to you. I called by appoint-

"I am with the President, and desire to make treason infamous."—GEORGE SHEA.

† At the old Delmonico's, corner of Chambers street.

ment at his residence at half-past eight o'clock in the evening. He was dining out and had not yet returned. The porter said that the Chief-justice would be in soon, as he expected me to take tea with him; and in a few moments Mr. Chase returned, and said that he had been to a dinner party at Secretary Stanton's, and had some trouble in breaking away from it. While we sipped our tea, I found Mr. Chase growing very communicative, especially concerning the rehabilitation of the Democratic party, and the probability that if it would, unequivocally and decisively, accept the actual situation of public affairs,—especially the abolition of slavery and the citizenship of the black man,—the next Presidential election might see that party restored to power. 'I,' he said, 'have always been somewhat Democratic in my opinions; and, now that slavery is at an end, there is no reason why I should not be more so. You may yet see some old abolitionist the candidate of that party for the Presidency.* After a few moments I continued the conversation by saying: 'Mr. Thaddeus Stevens, with whom I have recently talked, regards the accession of the blacks in the South to all the rights of citizenship as a political result of the war. He says it was an open and public war, and the Southern States are to be dealt with as conquered territory.' Mr. Chase here fell into a moment of thought, and then said: 'Congress itself has been of the same opinion. Have you considered the effect of Section 3 of Article 14 of the Amendment to the Constitution?' Leaving me, Mr. Chase went across the hall into the small library room on the left as you enter the street door, returned with a volume of the United States Laws, and having read to me the part of the Amendment he referred to, said: 'That is in harmony with Mr. Stevens's idea, and it seems to make doubtful the liability to further punishment for treason of persons engaged in the rebellion.' This meaning was certainly new to me; but, of course, whether the reading was intended as a suggestion or not, it has left a deep impression.† I said: 'Mr. Chief-justice, Mr. Stevens's opinion comes from the general principles of the law of nations, and not from any particular legislation. I called the attention of Mr. Stevens to Daniel Webster's declaration of the doctrine, and he esteems it as satisfactory and authoritative; so much so, that he told me he would use it in a speech which he is preparing in support of his bill for the confiscation of Southern lands.'

"I then read to the Chief-justice the passage

to which I had called Mr. Stevens's attention, from Webster's Bunker Hill Monument speech of June 17th 1825: 'The battle of Bunker Hill was attended with the most important effects, beyond its immediate result as a military engagement. It created at once a state of open public war. *There could no longer be a question of proceeding against individuals as guilty of treason or rebellion.*'"

Having told Mr. Blair all this, I added: "You can judge for yourself whether there is reason to make the inference I have drawn as to the Chief-justice's opinion."

Blair.—"I expect that you have some definite plan for me to lay before the President."

Shea.—"Yes. Yet, before entering on that, let me earnestly call your attention to the continued denial of Mrs. Davis's application to visit or even correspond with her husband. I have seen Mr. Stanton, and he told me that the intention of the Government remained unchanged as to this. Why,—of course I could not ask him. I wish you and, if permissible, Mrs. Blair would see what can be done through the President and Mr. Stanton to grant Mrs. Davis even a limited correspondence with her husband. The definite plan which our friends would wish you to lay before the President, in a friendly spirit and not officially in the first instance, is this: To have Mr. Davis released from actual imprisonment by some means known to the law—such, for instance, as that which Chief-justice Marshall allowed in the case of Aaron Burr, between the time of his arrest and trial. This could not be done till after Davis was manumitted from the military and delivered into the civil jurisdiction. I know that the pendency of the Wirz case before the military commission may continue to be an impediment to that course; but it is a significant circumstance that the name of Jefferson Davis, notwithstanding all that has been threatened, has not been placed in the charges and specifications in that case, as one of those with whom it has been charged that Wirz conspired. Is it not, Mr. Blair, an admission on the part of the Government that it is possessed of no evidence implicating Mr. Davis in that charge? If it could be arranged, according to recognized procedures, that Mr. Davis be delivered into civil custody, then the matter may take its usual course before a civil tribunal; and time may then fairly be taken by the Government to consider whether public policy requires further prosecution. Mr. Davis at liberty would be as any other person in the South. In prison, he is a power, and there an obstruction to any plan for the concil-

* A prophecy. This came near being his own case in 1868, and was actually Greeley's in 1872.—G. P. L.

† It was this construction of that law which formed

the very ground of the division of the court, and produced the final abandonment of the prosecution of Davis by the Government.—G. P. L.

iation of the whole country. Mr. Blair, should you find that the President thinks himself committed by what he has said about having this question of secession considered and determined by our highest legal tribunal, so as judicially to cast it out of our political system, in that case counsel for the defense of either Davis, Clay, or other prisoners of state might interpose a special plea in addition to the usual plea of not guilty; by which the whole controversy as to an act of secession constituting the crime of treason might be brought before the Supreme Court, without the complication of a trial by jury. This plan I have submitted to Mr. O'Connor, and it has his approval. He has authorized me to say so. However, Mr. Blair, in order to allow the case surely to reach the Supreme Court, it may be necessary that Congress give by statute the right of a writ of error in such cases, since at present there is no law allowing such an appeal. It must go there on a division of opinion in the court below.* Our friends are most anxious that all we attempt should have in view the political situation of the President, as well as the rights of Mr. Davis."

Mr. Blair said, "We will think further of this."

After dinner we resumed our walk and talk. Mr. Blair began by saying: "What you have proposed, I think well of. Even Sumner has said that a trial before a jury would be a farce. I shall see the President to-morrow afternoon, as on Sundays he has leisure; and he will act promptly in this matter. If you will hasten back to New York and put what you have said to me into writing, particularly regarding the Chief-justice, I shall lay it before the President privately, if I get any encouragement from him. I shall see what can be done for Mrs. Davis, and ask my wife to intercede with the President for her."

Mr. Blair, remaining silent for some time, finally said: "Much of this trouble need not have been. Mr. Davis himself had it in his power to have advanced the interests of our whole country. We all know that European nations are combined to establish on this continent interests inimical to our institutions and commerce. We should have held all of Mex-

ico after the Mexican war. You remember how strongly Robert J. Walker, then a member of the Cabinet, advised it. This country should never permit the policy of the Monroe doctrine to become inert." Here he turned and looked at me and, with a degree of warmth unusual to him, said: "I presume you are not aware of the object of the visits which I made to Richmond last January?—though one of our friends could have told you of it."

I answered: "One of our particular friends did suggest something in the spirit of what you have already suggested, and it now begins to form an intelligibility for me which it had not before."

"It is well," resumed Mr. Blair, "that you should know all now; so that you can avoid in further conversations with others of our intimate friends at the North any curious inquiries. I got permission to visit Richmond, and went there early in January. That visit was made not without some, although an indefinite, understanding with friends in power† at Washington. So far as my interview with Mr. Davis was concerned, I was there individually, without authority, but as an old friend of his and a man of many Southern tender relations. My proposition was: *that the Confederate army should recognize that Richmond was no longer tenable, and should evacuate that place; that the army should move south-westward, and should be followed by the national troops, but pitched battles should be avoided; that this pursuit should be continued until the Confederate armies should have crossed the Mississippi and gathered upon the frontier of Mexico; and that then they should be driven into that country and followed, as a matter of course, by the Federal troops. There, once in association on a foreign soil, nothing could prevent a fraternizing of both the Northern and Southern soldiers. This would have been a consummation that would have reconciled all concerned, and would have obviated any elaborate political device for reorganizing or restoring any State of the Union.* No other foreign nation could have found fault with our following a belligerent army into the territory of a neighboring country,‡ which had habitually given

* This was said in order to demonstrate the futility of bringing the political question before the Circuit Court.—GEORGE SHEA.

† This, I am assured, was the exact expression used.—G. P. L.

‡ Compare, on this point, the remarkable order given by General Grant to General McDowell, in a letter dated at City Point, Va., January 8, 1865 (and published in the "Tribune" November 8, 1885), respecting the possible invasion of California by Dr. Gwin, the Duke of Sonora. "In an event like the one alluded to," says Grant in this letter, "I would not rest satisfied with simply driving the invaders on to Mexican soil, but would pursue them until overtaken, and would

retain possession of the territory from which the invader started, until indemnity for the past and security for the future, satisfactory to the Government, was insured." Grant also says: "I write without having discussed this matter with any one. . . . This letter is written . . . entirely without knowledge of what the President would advise in case of an invasion of our territory from that of Mexico, but with a conviction that it is right and just." The date is of the month when Blair visited Davis, and the letter seems to show that the idea of occupying Mexico was "in the air," and in more than one mind, even though not officially acknowledged.—G. P. L.

I authorize George Sheple

of New York.

[The names of C. Vanderbilt and Horace Greeley, as in fac-simile above, were signed to duplicates of this letter, and Mr. Vanderbilt's seal was witnessed by Augustus Schell.—EDITOR.]

aid and comfort to the Southern Confederacy, and had set up an imperial government, with a European prince, as a menace to us and a home of refuge for those in open war with us. *I urged upon Mr. Davis that our people, once there, could not be made to leave ;* and Europe and Mexico would soon understand that we were there to stay.* European powers had combined, and were then actually proceeding to occupy that country permanently, against the will of the Mexican people, and the maintenance of the Monroe doctrine should impel us to prevent their success."

Shea returned shortly to New York, and there, a few days later, received from Mr. Blair the following letter :

"SILVER SPRINGS, September 9, 1865.

"GEORGE SHEA, ESQ.

"MY DEAR SIR,—I saw the President yesterday, and gave him the views you communicated to me. I told him frankly whence they came. He gave me no answer to communicate in return — although he conversed freely on the subject.

"In my opinion it would be well, if it is in your purpose to pursue the matter in the way you suggested, to put your views in writing and submit them to the President. I suppose in such form they might be made the subject of consideration in Cabinet, and in all likelihood the law officer might apprise you of the result.

Your obedient servant,

"F. P. BLAIR."

Mr. Shea soon afterwards visited Mr. Blair again, and said that it appeared to him embarrassing that he should have Mr. Blair hand to the President such a written statement, coming from one acting in behalf of a State prisoner, if it were to be submitted to the Cabinet.

Blair.—"If you do not trust the President, how can you expect him to trust you?"

Shea.—"I am willing to trust Mr. Johnson, but not to expose the project to the President's Cabinet. There are two members of the Cabinet whose passions on this subject would frustrate any plan, however commendable.†"

Mrs. Davis was soon accorded liberty to correspond with her husband and presently to visit him at Fort Monroe. This was the only immediate good that came from these conferences. The trial of Wirz proceeded. He was condemned because of his agency in the cruelty to prisoners, and executed November 10th, 1865. Now it seemed clear to many that the trial of Wirz was largely a proceeding of discovery for evidence implicating another higher than himself. The single point, also, on which light was desired by the band of friends — mainly Republicans — who had united to secure a large-minded pol-

icy towards ex-Confederates was this same question as to Mr. Davis's possible responsibility for ill-usage of our soldiers while in the hands of the enemy. Evidence on this point, I have already stated, Shea had undertaken to procure for Greeley, Henry Wilson, and — as Shea was given to understand — for Thaddeus Stevens. He went in the first week of January, 1866, to Canada, where he was to meet General John C. Breckinridge, stopping on his way, however, at Boston, to consult there with John A. Andrew and others. General Joseph R. Davis, of Mississippi, accompanied him.

At Montreal the two put up at St. Lawrence Hall. Breckinridge, who was at Toronto, telegraphed as follows :

"TORONTO, January 8, 1866.

"TO GENERAL J. R. DAVIS, St. L. Hall.

"I leave for Montreal on afternoon train.

"JOHN C. BRECKINRIDGE."

There, in a private room of that hotel, were placed in the hands of Mr. Shea some of the archives of the Confederate States. They were bound volumes, in canvas covers, secured with wax, and sealed. General Joseph R. Davis cut the covers open with a knife, and Mr. Shea carefully read and considered the contents — especially those messages and other acts of the Executive, with the Senate in its secret sessions, concerning the care and exchange of prisoners. From these documents, not made to meet the public eye, it was manifest that the people of the South believed that reports of supposed inhuman and unwarlike treatment of their own captured soldiers by agents of our own Government were trustworthy, and those people individually, through their representatives at Richmond, had pressed upon Mr. Davis instant measures of active retaliation upon Northern prisoners. It was equally and decisively manifest from these archives that Mr. Davis unflinchingly set himself in opposition to such demands, and declined to adopt the violent measures proposed. His refusal impaired his personal popularity and brought censure upon him from many persons in the South. The evidence obtained in this way was brought home by Mr. Shea, and submitted to Mr. Greeley, Gerrit Smith, and, in part, to Henry Wilson. The result was, that these gentleman and others associated with them laid aside all former suspicions of Davis and showed a positive friendly disposition towards him.

The "Tribune" at once began a series of leading editorials demanding that the Government should proceed with the trial ; and

* Blair's exact words, according to Justice Shea.— G. P. L.

† Mr. Stanton, Judge Shea says, was not one of the two.— G. P. L.

Senator Howard, of Michigan, offered, January 16th, 1866, a joint resolution, seconded by Charles Sumner, and passed, recommending the trial of Jefferson Davis and Clement C. Clay before a military tribunal, on charges mentioned by the Secretary of War in his Report of March 4th, 1865. It was, however, privately known to the Bureau of Military Justice that, if a trial of that kind were held, Thaddeus Stevens would act as counsel for Mr. Clay.*

Charles O'Connor and Mr. Shea, being already engaged for the defense of Davis, it was essential that they should be allowed to confer with him personally. Mr. Shea was sent to Washington to bring this about, and to apply directly to the President. Late on Saturday evening, May 19th, 1866, accompanied by an eminent Major-General,† Shea called upon President Johnson. He told the President that the object of his visit was to learn whether, if a writ of *habeas corpus* were to be issued by the Chief-justice of the United States, or by the United States Circuit Judge of Northern Virginia, Jefferson Davis would be delivered by the military authorities into the civil jurisdiction. Instantly the President burst into violent anger, and in loud tones declared that he would "not talk on that subject." Mr. Shea said: "I have come here for this purpose, Mr. President, supported by Senators and others who are disposed to act in this matter with the Administration. I think it would be wise at least to listen to what I have to say"; and he was about to name the men whom he meant, when President Johnson interrupted him with increased — nay, furious — anger, and burst into such a tirade, that Mr. Shea, turning his back on the President, walked with his friend instantly from the room.

The next day was Sunday. In the morning an aide-de-camp, who dragged a clashing saber at his heels, brought to Mr. Shea the following communication, written within half an hour after the time when he had left the White House:

"EXECUTIVE MANSION, WASHINGTON, D. C.,

"May 19, 1866 (10:30 P. M.).

"MR. GEORGE SHEA, Willard's Hotel.

"SIR: The President directs me to say that he will try and see you and the gentleman with you on Monday morning, if you find it convenient to call at that time.

With great respect,

"R. MORROW,

"Bt. Col. and A. A. G."

* I am informed, on very high authority, that among the papers of Thaddeus Stevens, in the hands of his literary executor, full evidence of this had been found. Mr. Burton N. Harrison also recalls that William B. Reed of Philadelphia was assured that Stevens was ready to act as counsel for Davis. Stevens's object was

The suddenness of this summons, following upon the recent scene, and brought by a military officer, might have suggested to Mr. Shea at first, before reading the communication, the possibility that he was to be summarily put under arrest, for such things were possible in those days. He returned a written answer by the President's messenger. The next morning he called at the Executive Mansion alone, and was met in a few moments by an official, who came to him in the upper hallway and said that the President would see him at once. Mr. Shea relates to me, as follows, the interview which then took place:

"When I entered the President's retiring room, the President and Senator James H. Lane of Kansas were together. Mr. Johnson had his hand upon the Senator's shoulder, talking to him in a very collected, earnest manner. On seeing me, Senator Lane said to the President: 'You have important business with Mr. Shea'; from which I at once inferred that Lane, who was one of the Senators whom I had it in mind to name on Saturday night, had brought about the change in the President's mood and caused me to be sent for. (Lane himself, the next day, told me that this was the fact.) The President continued talking with Lane in a subdued voice, briefly, and when the Senator left the room seated himself at his desk near the window. We were alone. He then requested me to take a chair close by the desk, and asked, 'Whom did you intend to allude to, last Saturday, as your supporters?'

"I answered: 'Senator Lane, Senator Dixon,‡ Ex-Governor Andrew, Senator Wilson; and the opinion of Thaddeus Stevens, I know, would favor everything that might tend to treat Mr. Davis like any other prisoner of war. Mr. Greeley and Gerrit Smith favor my application; and I am authorized to say that, when the Government consents to have Davis tried according to the civil law, Cornelius Vanderbilt will be one of the bondsmen for bail.'

"The President looked at me steadfastly, and seemed to be amazed. I told him that we had determined to wait, before approaching him, until the Administration could depend upon proper support from those most active in upholding the Union. I said: 'The communication which I am told that old Mr. Blair forwarded to you from me has not been followed up by us.' I also said, 'that the letter which Mr. O'Connor had sent, about the same time, offering to give his bond for \$100,000,

to prove at the trial that the Southern States had been in open war, out of the Union, and therefore subject to treatment as conquered territory. In this manner, from an opposite motive, he fell in with the reconciliationists.—G. P. L.

† Q. A. Gillmore.

‡ Of Connecticut.

and to become thereupon the special custodian of Jefferson Davis, was not known to us until afterwards, when O'Connor complained that he had received no reply. The gentlemen whom I represented,' said I, 'wished that the law should take its usual course, without further impediment from the Government.'

"The President said he thought this application was in the right spirit, and ought to be considered. 'It would be well for you,' he said, 'to see the Attorney General.'

"I answered, 'I have already done so, and I think he does not object to Mr. O'Connor and myself communicating with Mr. Davis as counsel. But he hinted no opinion as to delivering Mr. Davis on a writ of *habeas corpus*.'

"The interview lasted fully half an hour. The President spoke on other topics, and always in a low, sad voice. Had I not seen his wild, passionate behavior at our meeting two days before, I should not have believed that he was capable of such rage.

"Finally, he took a small sheet of paper, folded it once, and slowly wrote with a short wood lead-pencil — an end of which he had held in his mouth while considering the words — a few lines, put the sheet in an envelope, and sealed it with a common red wafer. I suppose no act so important was ever done with less formality. As he pressed the wafer down, I remember that his thumb slipped and made a smear of the wafer from the center to the corner of the envelope. Writing the address, also in pencil, to 'Hon. Jas. Speed,' he handed me the note and said: 'Will you take that to the Attorney General?'

"I took my leave. The President, rising, went with me towards the door, and there, offering his hand, said: 'Don't forget to call when you are in Washington again.' But it so chanced that I never saw Andrew Johnson after that time. A few minutes with Mr. Speed, who seemed equally surprised by the President's note and by what I told him about my allies, sufficed. The next day I received from him an assurance that the Government had sent orders to Fort Monroe that Mr. O'Connor and I should be admitted to see Mr. Davis. No answer was given as to the writ of *habeas corpus*. On the next Sunday morning, Mr. O'Connor and I landed at Fort Monroe, and saw Mr. Davis, then imprisoned in a casemate. His beard, which had grown, I presume, while he was in prison, had changed the expression of his face, and at first I did not recognize him. I had seen

him but once before, and now met him for the first time. The danger of a military court to try Davis, like that which had condemned Wirz, was still imminent. I was aware that officers had been named for it, and that General David Hunter was to be President. But, later, the prospect of any sort of trial taking place became vague."

THE time seemed ripe, at last, for attempting to liberate Davis on a writ of *habeas corpus* and bail-bond. Commodore Vanderbilt, Gerrit Smith, and Horace Greeley now gave Mr. Shea their individual and unlimited powers of attorney to act in their behalf as bondsmen for Davis. This was in June, 1866. The attempt failed. On May 1st, 1867, another and like effort proved successful; and then Vanderbilt sent to Richmond his own son-in-law, the Hon. Horace F. Clark, to act for him; but Gerrit Smith and Greeley were there present in person.

The case of the United States *vs.* Jefferson Davis was not disposed of until near the end of 1868, and then on demurrer to the indictment. Chief-justice Chase and Mr. Justice Underwood presided. The Chief-justice announced on December 5th, 1868, that the court had failed to agree upon a decision, and then this certificate of division and of the question was filed: "Whether, by the operation and effect of the third clause of the Fourteenth Amendment to the Constitution of the United States, the defendant is exempted from indictment or prosecution for treason in levying war and participating or engaging in the late rebellion. And upon that question the opinions of the judges were opposed. And thereupon the said point is upon the request of the said defendant, stated under the direction of the said Judges, and certified under the seal of the said Circuit Court to the Supreme Court of the United States at its next session."

Thus ended a prosecution which, as Charles Sumner foretold in the Senate, was to be a failure. But there was one person who, if present in that court-room, would not have shared the general surprise when the Chief-justice, as the court adjourned *sine die*, "instructed the reporter to record him as having been of the opinion, on the disagreement, that the indictment should be quashed, and all further proceedings barred by the effect of the Fourteenth Amendment to the Constitution of the United States."

George Parsons Lathrop.

SOUVENIR DE JEUNESSE.

WHEN Sibyl kept her tryst with me, the harvest moon was rounded,
In evening hush through pathways lush with fern we reached the glade ;
The rippling river soft and low with fairy plashes sounded,
The silver poplar rustled as we sat within its shade.

“And why,” she whispered, “evermore should lovers meet to sunder ?
Where stars arise in other skies let other lips than mine
Their sorrows lisp, and other hearts at love’s delaying wonder.—
O stay !”— and soon her tearful eyes were each a pearly shrine.

I soothed her fears and stayed her tears, her hands in mine enfolding,
And then we cared no more for aught save this one hour we had ;
Upwelled that dreamful selfish tide of young Love’s rapture, holding
The fair round world itself in pledge to make us still more glad.

For us the night was musical, for us the meadows shining ;
The summer air was odorous that we might breathe and love :
Sweet Nature throbbed for us alone — her mother-soul divining
No fonder pair that fleeting hour her zephyrs sighed above.

Amid the nodding rushes the heron drank his tippie,
The night-hawk’s cry and whir anigh a deeper stillness made,
A thousand little starlights danced upon the river’s ripple,
And the silver poplar rustled as we kissed within its shade.

Edmund Clarence Stedman.

JAMES McCOSH, PRESIDENT OF PRINCETON COLLEGE.

WO distinguished Scotchmen have served Princeton College in the office of President. But by a striking paradox they have both been more thoroughly American than if born to the manner. John Witherspoon, chosen in 1768 to the seemingly unimportant office, at first declined; but learning later from Richard Stockton of the potential influence of such a position, accepted. With the blood of John Knox in his veins, he discovered, on his arrival, with the prophetic vision of his ancestor the deep meaning of the contest between the colonies and their infatuated masters, the king and parliament. His record as an ardent American patriot, as the instructor of James Madison in the formative principles of the Constitution, as a signer of the Declaration of Independence, and as a leader in molding public opinion throughout the war of the Revolution, fills a splendid page of American history. His services to the college were scarcely less splendid than those to his adopted country. He reorganized its teaching body, increased its funds, and paid its debts. His great reputation as a statesman and a divine attracted to Princeton sons of many of the most distinguished families in the land. The list of graduates during the twenty-five years of his presidency is not less a matter of pride to the country than to the college. To the names of Ephraim Brevard, Philip Freneau, James Madison, Aaron Burr, Henry Brockholst Livingston, Gunning Bedford, and Jonathan Dayton might be added many others of scarcely inferior fame. Of the fifty-five members of the convention which framed the Constitution, Princeton furnished nine, and five of these had been personally taught by Witherspoon. Of his other pupils, sixteen sat in the Senate, forty in the House, four were cabinet-officers, four governors, nine presidents of colleges, and an equal number occupants of various professional chairs.

Perhaps it was the memory of such achievements, perhaps it was the same instinct with which good society recognizes its own, that led the trustees of the college, a hundred years later, to look over sea for another President. Be that as it may, it was exactly a century after Witherspoon's inauguration that James McCosh entered upon the duties of the same office.

We are having serious contentions about

the environment of men, and its effect on character. One thing is certain, that many of the foremost Americans have emerged from very un-American surroundings and training. There is a certain type of intellect and mold of character which belongs here. It makes little difference whether it develops by Swiss lakes and mountains, as did that of Agassiz; whether it acquires consistency on the flat marshes of Prussia or amid the thunders of Waterloo, as did that of Francis Lieber; or whether it grows by merchandising on the banks of the Garonne and at the wharves of Bordeaux, as did that of Stephen Girard,—the American world finds place and scope for it in its varied interests and knows it as essentially its own.

This was true in a high degree of the Scotchman from Brechin and Belfast. And he knew it as well as those who called him. In the early days it was no reproach to be a foreigner in a community where the preceding generation had been one of immigrants. Four generations later it was quite different, and no little courage was and is required for one not born on our shores to accept a public position of the first importance. What is said to be a characteristic anecdote is told by some of Doctor McCosh's first American pupils. At the close of his first class-room lecture there was an outburst of somewhat undignified but honest applause. Veteran teacher as he was, he misunderstood it—very probably from the exaggerated accounts of student waywardness which college-bred men are so fond of repeating. But with the fearlessness of his conviction that such demeanor was but an excrescence on American manners, he checked it successfully with the quiet and stern remark, "I am not to come to you, gentlemen; it is you who will come to me." The instinct of his mind was true. The mutual interchange of relationships has brought the college to him in many high senses, and even more certainly has fastened his name and fame in the most enduring bond to those of the institution for which he has labored in season and out of season with abiding devotion for nearly a score of years.

The success of Doctor McCosh's administration as presiding officer of the College of New Jersey is already well known to the public. One is almost tempted to say too well known, for it has happened to him as to other successful organizers that his results have been prematurely judged as complete, and his final

aims marred by well-meant but cruel exaggerations. At least that is what we seem to read between the lines of his recent pamphlet on education. Like his great predecessor he has strengthened the traditional spirit of his college, rallied to its support its hereditary friends and gathered many new ones, amplified and reënforced the course of study, and brought its system into prominence as a leading candidate for the favor of the great public. It has been the repetition of the old experience that with the Time came the Man. The stream of liberality which was ready to break forth at the sufficient incentive found its release in the confidence of the public in his management and that of the corporation, and in the high purposes which were revealed by his untiring agitation of educational themes.

What is of primary importance is that in this great work the jealous American spirit has not been roused to any opposition or anxiety by the use of foreign methods or the display of any but the most American feelings and tendencies. While the press utters its warnings as to foreign mannerisms and foreign teachings in other prominent colleges, and spares nothing of its watchfulness and advice with regard to Princeton, at least it never has even hinted at foreign invasion, where, under a Scotch executive, it might most be expected. This is perhaps the more interesting because the personality of Doctor McCosh is thoroughly Scotch, and his address very impressive — not to say aggressive. With a massive but spare frame which, when his mind is roused, abandons its scholarly stoop and towers above expectation, is combined an unusual nervous force which often manifests itself in vigorous gestures. His head and brow are even more expressive of power; even to the usual observer the broad forehead and keen eyes bring into prominence his well-known capacity for an impetuous, unyielding, intellectual onset. But in repose the philosopher and the divine stand revealed in the bowed and meditative attitude which is customary, and in the wrapt, abstracted expression of the features, and in the contemplative poise of the head so familiar to all who have paused to observe him in his daily walks.

The streets of Princeton form lovely vistas of deep shade and glancing sunlight. Old and mossy mansions of colonial days still linger among the massive self-asserting structures of modern architecture, and old Nassau itself muses upon the changes of nearly two centuries. An academic air pervades the whole town, and during the hours elsewhere given to the stir of labor and business, the wide avenues and broad lawns wear the same studied repose which in life so often overlies

activity and ambition and unrest. The hidden life only appears at midday and in the evening when the streets resound to the tramp of the students' constitutional and the distant shouts of the playing-fields. There is no need to fill in the outlines of the familiar picture. Its colors, like those of the old masters, mellow and soften with age. But it will be somber and dusky enough to some of us when we make our annual pilgrimage and miss the familiar form of the master from among his colleagues and his boys. We will forget his austerity in the faithfulness with which he reproved the *vitium regere non posse impetum*. Our awe will melt with affection, and our respect for his wisdom and knowledge will awaken memories both lasting and beneficent.

The public knows Doctor McCosh as the author of erudite and recondite philosophical treatises. It stands in no little awe of him as a defender of old-fashioned doctrines in the pulpit, in the press, and even in the hostile circles of the "liberal" clubs. It pictures him as an intrepid explorer for benevolence, who traverses the wilderness of worldliness and defies the sultry heats of indifference to reach the hidden fountains of good-will and make known their virtue to the world. Such a reputation is enviable enough, but it is not half of the whole, and an old pupil could not attempt a portrayal of the man without falling into something of the sentiment which his personal traits develop in all who come in contact with him. Even his polemic is imaginative, as will be admitted by all who are familiar with the style of his philosophical writings. When a candidate for the professorship of mental science in Queen's College, Belfast, some friends sent a copy of his first book, "The Method of the Divine Government," to Lord Clarendon. That eminently practical statesman has left on record that he spent the night in reading the book, and gave the appointment to its author on the following day. This was the occasion of those scornful lines of Master Molloy Molony which Thackeray preserved for us:

"As I think of the insult that's done to this nation
Red tears of riving from me faytures I wash,
And uphold in this pome to the world's detestaytion
The sleeves that appointed Professor McCosh.

Is it thus that you praych me?
I think all your Queen's Universities bosh;
And if you've no neetive professor to taych me
I scawurn to be learned by the Saxon McCosh."

If we have long neglected our Scott, the conception of geniality as a necessary characteristic of the Scotch is not always clear. But James McCosh was born in Ayrshire, the land of Burns. His father was a wealthy farmer, and in the days before the Washing-

tonian movement had penetrated the valley of the Doon, no doubt those who had known the great poet often clinked glasses with the lad. It would have been strange if the Ness Glen, the Braes of Ballochmyle, and all the romantic scenery of the Doon and the Ayr which roused the plaintive muse of Burns should have left untouched the more restrained but youthful and susceptible mind of his countryman. As a matter of fact, the deepest impressions were left on the young man's temperament by the scenery of his early home. His theory of æsthetics is ever illustrated by references to nature, and the art in which he seeks his favorite relaxation is that of the landscape gardener. The experiences of his boyhood have left a clear stamp on his memory, and in the familiar talk which at times interrupts the dignity of a lecture or the solemnity of a sermon, frequently serve to point a moral. One of the most humorous is very characteristic. On a certain day about his ninth or tenth year, his mother was to make her regular visit to the nearest market town. Her younger son was to enjoy the dignity of escorting her as a reward for good behavior. The drive was delightful, and the sense of merit and importance grew stronger and stronger in the child's mind. Arrived in the main street, the horses and carriage were sent to the inn stables, and the shopping tour began. Before long the boy began to suffer somewhat, as do most of his sex under similar circumstances. He was stationed accordingly at the door of the shop with strict injunctions to keep his hands off the tempting wares exhibited at the door of the grocer. Before long a sweep with all his sooty armor spied in the doorway the small but important figure, somewhat conscious of his first-best clothes, and began a series of those insulting gestures with which street gamins express disdain and sportive contempt. For a time the young countryman forbore, but he had been "brought up on gude parritch," and could at last endure no more. He accordingly attacked and thoroughly thrashed the mocking sweep before his mother, attracted by the gathering crowd, could interfere. What was his dismay when, instead of the approbation which he felt he had earned, the crowd broke out into laughter at the sight of his sooty and smutty face and garments. The carriage was instantly recalled, the bedraggled victor hurried into it, and the eagerly expected day of pleasure turned into one of humiliation by the long and dreary homeward journey and the reproofs of his father.

He received a sound and thorough education at the two most famous Scotch universities, those of Glasgow and Edinburgh, residing five years at each. The teaching in both was

solid rather than brilliant. Adam Smith and Thomas Reid were long since in their graves, but the teachings and traditions of such men live after them, and their impulse was not yet spent in Glasgow. No doubt the young student was deeply influenced and the natural inclination of his mind strengthened by the great past of his first university. And when afterwards he went, in 1830, to study theology at Edinburgh under Chalmers and Welsh, he found there the young Sir William Hamilton, who, although not yet in the chair of logic and metaphysics, was writing his philosophical essays for the "Edinburgh Review," and delivering stirring lectures on civil history and literature. It was doubtless Hamilton's appreciation of an essay written by McCosh on the Stoic philosophy which led the university to reward it by giving an honorary degree of Master of Arts to its author. But this success did not tempt him from his chosen profession. From 1834 to 1843 he was a pastor in the Established Church, first at Arbroath Abbey, and afterwards at Brechin.

It was in the latter place that he was first called to exhibit the qualities which endeared him to those of his own denomination in America and afterwards identified him with their thought and work. He had long been a prominent member of the Evangelical or Reforming party in the Scottish Church under the leadership of the distinguished Chalmers. That movement came to a climax in 1843. McCosh at once threw up his valuable living, joined the ranks which organized as the Free Church, and founded many societies of those who wished to be independent of royal interference in the exercise of their religious liberty. He was active throughout the counties of Angus and Mearns, and in Brechin itself established a large church, of which he was the successful pastor until 1852. His career as an author began somewhat earlier, first in contributions to the reviews, and in 1850 by the publication of his first book, which the University of Aberdeen rewarded by conferring on him the degree of Doctor of Laws.

His life work as a teacher and writer began when in his forty-first year he accepted the chair of Logic and Metaphysics in Queens College, Belfast. From that time forward his contributions to philosophical and religious literature have not ceased to grow in number and importance, and his seventy-fifth year finds his mind and pen in constant activity. The work which spread his fame most widely and put him among the leaders of the Intuitionist School was written at Belfast. In the "Intuitions of the Mind Inductively Investigated" the author is at his best both as a thinker and a writer. His reasoning is vigorous and his

logic unassailable, if his premises be once granted ; while his style is direct, easy, and elegant, and, without being florid, adorned and enlivened by abundant metaphor and illustration. His public life in Ireland was quite as active and influential as his leadership had been in Scotland. He was an adroit and successful advocate for the national system of education, was called to assist in the organization of the English Civil Service, and, true to his instinct of civil and ecclesiastical freedom, agitated and prepared the disestablishment of the Irish Presbyterian Church. What better training for American life could he have received, or what greater aptitude for its duties and prerogatives could he have manifested ?

One of the greatest events in the history of the Reformed churches for fifty years was the organization of the Presbyterian Alliance and Council. While the idea was not entirely new, the first productive discussion of the subject was that of Doctor McCosh before the representative body of American Presbyterians in 1870. Two years later was celebrated in Philadelphia the three hundredth anniversary of the Reformation in Scotland. On that occasion he presented a complete scheme of organization, and three years later was chairman of the conference in London which realized the project. Since that time his work has been devoted almost exclusively to the interests of his adopted country. He has made addresses before the great teachers' associations ; written review articles that have attracted wide attention ; written seven of the long series of his philosophical works, while simultaneously strengthening and directing the interests of the educational system of which he is the head.

Already in the United States we begin to say : There were giants in those days. Every new generation is driven to closer specialization by the increase of knowledge and by the crowds which jostle for a place in the professions and in business. So while we perhaps build higher, we have not so wide a pedestal for our shaft. The wonder concerning men eminent in one department and strong in many is how they do it ; where they find time, humor, mood for such diversified work. Those who have ever been active in the stirring life of Princeton College could not explain it in the case of Doctor McCosh. He is seen about the college yard from early chapel till midnight or later. Except from three to five in the afternoon he is never denied to any caller, however unimportant his errand. The parent or casual visitor who would like a little attention always gets it. The students are always welcome whether they earnestly seek for advice and instruction, or

in some captious mood lay down a plan to revolutionize college government, to change systems of instruction, or to have their own way in whatsoever direction. He is constant in his attendance at faculty and committee meetings, presides at the public lectures, makes long journeys to stimulate and guide the alumni, and is a close observer of all intellectual and educational progress. But he will turn from conversation to his writing-desk without an interval. The change from one intense occupation to another is his rest. The pseudopsychologists of modern literature have flattered the yearning public into the belief that there is not and was not what is commonly called genius. Perhaps they are right. Let us take them at their word and substitute for genius, capacity for productive work. Both sides will be content.

Very little has been said of President McCosh's relations to his students as a teacher and a friend. That side of his character cannot yet be fairly depicted. Strong natures are apt to be aggressive, and no doubt there are many men of middle and older age who have felt the brunt of his attack. But in his dealings with the young there is little or none of that. Beyond the strength which is necessary to faithfulness, his unconscious method is persuasive. His study has seen the beginning of new purpose and strength in many a wayward lad. The man will not perhaps tell the story of pleading and fatherly reproof till old age makes him retrospective. But the work of McCosh's class-room will always have an important place in the history of philosophy in America. It is doubtful if any university — even in the old world — can show a more wide-spread interest in philosophy among its undergraduates. This is shown not so much by the philosophical chairs which are now held by his pupils, nor even by the great size of the classes which voluntarily attend his lectures, but rather by what are called his library-meetings. Here are read, about once a fortnight throughout the autumn and winter, papers in all departments of metaphysics, commonly written by the younger claimants for the ear of the public. The hearers, composed largely of the intellectual aristocracy of the Junior and Senior classes and the Divinity School community, number fifty and upward. The essay, however able, is often the most unimportant feature of the evening. But it presents the subject of discussion and controversy, which, stimulated and guided by the President and his professors, furnishes the opportunity for many a fledgeling to try his wings and often encourages him to further effort. Time alone will show how fruitful this peculiar feature of Doctor McCosh's teaching is to be,

but the thing itself is enough to put him in the first rank of great teachers. The system of philosophy which he expounds is partly that of the Scotch school, but also in great part his own. Its conscious influence in the history

of American thought has already been great, its unconscious influence even greater. In the philosophic record of our somewhat unphilosophic times his name is sure to have a prominent position.

John van Cleve.

TOPICS OF THE TIME.

National Strength and National Weakness.

MR. ATKINSON'S studies in the application of statistics to social science, the second of which is published in *THE CENTURY* for this month, are the culmination of a process which the author's readers must have noticed in his previous work. He is not peculiar among economic writers for the relentlessness with which he follows out comparisons of results so much as for his energy and persistence in seeking accuracy of definition in the preliminary statistics. The modern introduction of graphic methods into statistics has enabled him to reduce facts which are in themselves too large to handle into a shape in which they are easy to grasp; and to deduce therefrom conclusions which the business man can no more resist than he can deny the result of an accurate balance-sheet.

No stronger or sounder plea has been made for the application of common sense to national concerns, for the abandonment of the old notion that a nation lives for the gratification of national greed or "glory," and for the substitution of the prosperity and happiness of the people as the end of national existence. It is not easy to realize the strong hold which the residuum of ancient ideas retains in the countries in which, to adopt one of Mr. Atkinson's felicitous antitheses, dynastic principles still contest the field with democracy. Even where the people have obtained more or less control of the government, the mouth-pieces of public opinion remain bound by the spirit of the past. The knight-errant still tilts full-armed through the columns of the daily press, careers through the aisles of parliamentary bodies, and too often usurps the place of the proper occupant of the pulpit. Why is the pressure to look upon every trespass as an insult to some piece of bunting, deserving only of an instant declaration of war, so strong among the armed nations of Europe? It is not from love for the true interests of the people: peace is the one thing needful for them. It is because the nightmare of obsolete ideas still rides the expression of public opinion.

Individual life has been compared to a game of chess with an invisible antagonist, who knows every move on the board and takes remorseless advantage of a false move to crush the one who makes it. Nations must pay the same penalty. The growing commercial wealth of Europe has been made an instrument of gratifying national vanity, and of all the foibles of the modern representatives of the former privileged classes. And thus the race between European peoples has been brought to a deadlock; the contestants, with energies chilled and congested by debts, taxation, and the nameless weights arising from uncertainty of

peace, are unable either to proceed or to get out of the way of others. Their natural development has been arrested; and their time is occupied in watching one another, and in holding every muscle in tense readiness to spring at some neighbor's throat at the first sign of hostility. Is this the true end of national life? And a new participant in the race has appeared from beyond the Atlantic; his energies are not weighted as are those of his competitors; and his increasing speed is carrying him swiftly past them. To him that hath shall be given, and he shall have abundance; but the lesson of these articles is that, unless Bismarckism and Czarism and Chauvinism cease to control the peoples of Europe, they must lose even what they now have to the unencumbered American racer.

We may see, too, the absolute profit of the enormous expenditure of our Civil War. The reason for it was the blind but correct national instinct that the introduction of independent States, international relations, and dynastic ideas into the territory now occupied by the United States must be prevented at any cost, for the sake of the people to all future generations. The justification of the national instinct needs no more than Mr. Atkinson's methods. He puts the cost of the war at about \$1,135,000,000 per annum for the seven years' period of actual warfare and the settlement of terms of peace. It is now a time of profound peace in Europe. Even the Servians are quiet for the time. And yet there are now in active service, in the armies and navies of Europe, over four million men, who do no work except to undergo drill and look warlike. Even Portugal, not quite as large as the State of Indiana, must have its standing army of thirty-four thousand men, about as many as the whole United States army, and thirty-nine vessels in its navy. All this, it must be remembered, is what they call peace in Europe; it is not a circumstance to the mustering of men that would follow the first shot of actual warfare when the 10,129,541 reserves are called out. The direct annual money expenditure upon all these armies and navies in time of peace is about \$750,000,000; and if we include the indirect losses and the effects on the amount of the civil list, as in the estimates for the American war period, the amount would approach \$1,000,000,000 per annum. The somewhat startling conclusion is that the seven years during which we waged a tremendous war and settled the terms of peace really cost us, after all, no more than eight years of the present profound peace costs in Europe under the modern system of international suspicion and armament. By approaching the European standard for seven years, we obtained a permanent insurance against the necessity of any future approach to it.

Mr. Atkinson has done the country a service by recalling its attention to the homely but essential fact of the bearing of taxation on the comfort and prosperity of the laboring class, which is so large a part, indeed, so nearly the whole, of American society. It behooves his audience to take his sermon to heart, and to apply the principles which it discloses to all our national conditions. What will be the influence upon our prosperity and comfort of any attack on society which compels society to strengthen itself, to increase taxation and expenditure, and thus to approach more nearly to the conditions under which labor groans elsewhere? Will that part of our labor which has fled from such conditions attempt to reintroduce them here? And in any event, will American labor submit to such an imposition?

Labor Parties.

THE organization of political parties in the interest of the working class and composed in the main of members of that class seems likely, for a time at least, to continue in America. Such organization is in no way surprising, in view of the discontent among the working classes and of the tendency, now so common, to invoke the aid of Government for every scheme of social reform or amelioration. The capitalists of this country have not been backward in asking for Government help for all sorts of enterprises, and it is natural that working-men, if they have objects of their own to promote, should pursue a similar course. But when we come to inquire what objects they are really seeking, we find ourselves somewhat at a loss for an answer. We find in the platforms adopted by the party caucuses strong denunciation of capitalists and corporations, and of Government officers for yielding to their influence; we find also the expression of a desire for higher wages for working men and women and for the removal of poverty, and various minor grievances are sometimes alluded to. But when we ask how the new party proposes to remove the evils it complains of, we get no adequate reply. The principal definite measures we have seen proposed are the confiscation of the rent of land and the purchase and operation of railways by the State. How much support the second of these measures may have among the working people we do not know, though we have seen no evidence of its popularity, but as for the land measure, we doubt if it has any great number of adherents outside of the large cities. In fact, we doubt if the workmen have any clear idea of what they would do in case they could get control of the Government in state or nation. Indeed, the want of a definite policy and the disagreement known to exist among working-men in regard to protective tariffs, the ownership of land, and other matters, make it tolerably certain that the attempt to organize a national working-men's party will for the present have no great success. Nevertheless, such a party may be organized on a small scale, and in any case the movement in question cannot fail to have an influence on the older parties and thereby on the politics of the country in general. It is important, therefore, to ascertain as near as possible what the bases of the new movement are, in order that it may be resisted so far as it is wrong, and guided in a better way.

The charge that has been preferred against the new

party in some quarters that it is composed of anarchists and organized in the interest of social disorder may be very briefly dismissed. There is no evidence that any considerable number of working-men are in favor of any but peaceful means for the promotion of their interests; indeed, the organization of a working-men's party may be taken as proof of the contrary. Men do not organize political parties in order to abolish government, but in order to get control of the Government; and if the history of trades-unions counts for anything, the tendency of a working-men's government would be rather toward despotism than toward anarchy.

Again, it is apprehended by some that the Labor party is socialistic in character, and aims at the abolition of private property; but this also we believe to be a mistake. There is a tendency to socialism in certain portions of our population; but it is not confined to laboring men, and we suspect that it is not really so powerful as it sometimes appears to be. The vast majority of our people, both native and foreign-born, are either owners of property or desirous of becoming so. The Irish, for instance, are prominent in the ranks of labor parties; but there is no man more eager to possess property of his own than an Irishman, and when he has got it he holds on to it. It is in the cities chiefly that socialism finds adherents; yet even in the cities they are a small minority of the population, while in the country districts they are rarely to be met with. The farmers, especially, are sure to oppose socialism, and no movement among working-men has any chance of success without the support of the farmers.

The truth seems to be that the political labor movement is merely one manifestation of the general discontent of the working people, and of their desire to improve their condition. Working-men are dissatisfied with their present life and earnestly desirous of improving it; but how to improve it and make it nobler and happier, they very imperfectly understand. At present they are intent on gaining material comfort and power, as, indeed, most other men are in our time. Many of their number, especially in the large cities, are in extreme poverty; and so to most working-men the question of improving their life seems to be mainly a question of increasing their income. The wisest of their number seek to effect this object by the sure method of industry, skill and economy; but even the wisest of them, and still more the unwise, think they can effect something in this direction by political and social influence. Hence the policy of strikes and combinations, which, however, have done little toward attaining the end in view; and hence, also, the tendency now visible toward political action.

The political labor movement is not a transient phenomenon, destined to speedily disappear, but a movement of more permanent character, which will continue in some form until its objects, so far as possible, have been attained. For this reason it behooves our statesmen, and the educated and thinking classes generally, to consider what they ought to do in order to guide the movement aright. An exclusively working-men's party is an undesirable thing, even if its aims are right; and no such party can be maintained for any length of time if an honest attempt is made by the educated people to help the working-men improve their lot.

That much may be accomplished, if all classes will work together for this end, there can be no reasonable doubt. Moreover, the duty cannot be shirked. The question of improving the life of the toiling masses is the main political and social problem of the age, and will remain so until it is solved — if solution be possible; and it can only be solved by measures that are just to all other portions of society. While American working-men are desirous of attaining their ends by just means, they are liable to be misled by their passions or their supposed interest, or by designing men who pander to both. It is the duty of the best men among us to do all they can to help the working-men in their legitimate aspirations, and at the same time to show them their errors and rebuke them when they go wrong. With popular leadership of the right sort, parties made up of laborers mainly would soon cease to exist, and working-men would attain their ends by means of parties composed of all classes and aiming at the good of all.

The Harvard Celebration.

IN looking back upon the Harvard celebration, every one who was present will remember that there were a few notes constantly recurring in the progress of the festivity like the theme of a symphony. Every time these notes were touched by the speakers, the assembly showed its approbation by unmistakable signs of sympathetic response — not always by applause, but sometimes by the emphasis of silence. Doubtless the same impressions were conveyed — only less sharply — to those at a distance who read the reports. It is not easy to translate these dominant thoughts into formal propositions, yet it may be worth while to point them out — for their reception no less than their utterance was indicative of the present attitude of American scholars. We say "American scholars," because the Cambridge assembly was national and not provincial, and it included the leaders of educational, scientific, political, and religious thought.

"They builded better than they knew" was the testimony of all the speakers who had occasion to allude to the Puritans of the seventeenth century who laid the foundations of Harvard. Firm in their own narrow beliefs, they did not endeavor by charters or confessions to perpetuate their creeds. They expected growth.

Another note was the persistence of moral and religious forces in education. This idea was suggested in the oration before the law school, reiterated in the sermons, and enforced in the chief address. Those who have been alarmed lest the tendency of scholarship should be away from spirituality and from righteousness must have heard with satisfaction from the lawyer and from the man of letters words like these: "Nearly all the education which men can get from others is moral, not intellectual," said Judge Holmes. "Nor will our university ever be discouraged in the attempt to establish the foundations of that noble and high character which makes useful men able in their own persons to exhibit exalted lives," were the words with which Judge Devens began a paragraph upon the moral earnestness of Harvard graduates in modern times. "The motto *Christo et ecclesiæ*, when rightly interpreted," said Mr. Lowell, "is the same as *Veritas*, for it means that we are to devote ourselves to the highest conception we have of truth and to the preaching of it."

Not less pronounced were the utterances which referred to the purification of political life. No allusion to John Harvard, or to the Alma Mater, or to the illustrious sons of the university, called out such applause as followed every mention of purer politics. The President of the United States and his secretaries could not misinterpret the ringing words of successive speakers, and the still louder ring which surged from the audience at every mention of the honest administration of government.

Finally, there was constantly manifest an adherence to lofty ideals of scholarship and learning not devoted to selfish advantage, but consecrated to the public good. Although the occasion was historical, there were but scanty allusions to antiquarian lore; although the university is a leader in science, the voices which were heard at its festivity were those of literature and philosophy; although increased resources are required for the expansion of this great foundation, money was not mentioned. The most liberal culture, the most earnest search for truth, the study of the noblest literature, the perpetuation of thoughts that live and words that burn — these were the aspirations of that representative assembly.

It is by a beautiful process of development that the college, begun in poverty by exile and Separatist, in the wilderness, at the dawn of civilized life in America, has grown to be the great university of our land, liberal, hopeful, useful. May its youth and vigor be perpetual; religion, politics, literature, and science will be promoted by its growth!

The American School at Athens.

THE determined attack upon classical education, which looked for a time like a successful rebellion, has been in reality of signal service to the cause against which it was directed. Among other offensive measures adopted by the friends of the old learning was the establishment at Athens of a school where rising American Hellenists could enjoy the same advantages as were afforded to their co-workers from Germany, France, and England. The practical man would have flouted the scheme as chimerical. But, four years since, a few professors from leading colleges, full of an old-fashioned quality known as faith, met and devised a plan. Each was to appeal to his own constituency for an annual subscription toward the necessary expenses. The school was founded. At the present moment it has the active assistance of no less than sixteen colleges. It owns a fine site on Mt. Lycabettus, presented by the Greek government; has in process of erection a commodious and solid building to cost twenty thousand dollars; possesses a library of between fifteen hundred and two thousand volumes; is free from debt, and has an established reputation. Cholera closed the Levant to travelers for one of these years; but no less than eighteen students have been in regular attendance, and scores of travelers have enjoyed its advantages, received counsel in their sight-seeing, and disseminated its influences among their friends. The regular students are now instructors and investigators in their own land, and have brought back the enthusiasm for their work which is so strengthened by the seeing of the eye, the touch of the hand, and a general experience of classic lands. One of them, by the generosity

of Miss Wolfe, was enabled to extend his researches to Asia Minor, from which he brought away a collection of over nine hundred inscriptions which, in the opinion of the great European epigraphists, is second to no other in historical value, and will, when edited and published, add great luster to American scholarship in the person of Doctor Sterritt.

To secure it in its permanent usefulness the School must now be intrusted to the care of a larger public. It is proposed to raise a general fund of a hundred thousand dollars for the development and endowment of the School and in particular to employ a director of the highest fitness and ability. Our readers need no introduction to the archæologist Charles Waldstein, a native of New York, but now connected with the University of Cambridge, England, and with the Fitzwilliam Mu-

seum. The committee in charge of the School wishes to redeem the character of America, and to secure him and his work for the benefit of his own countrymen. A beginning has already been made. The kindness of the Philadelphia students and the untiring efforts of Professor Ware brought together for the rendering of the Acharnians in November last such an audience as the old Academy of Music never before sheltered under its roof. From that performance and subscriptions since received, a few thousands are already in the treasury of the permanent fund. The colleges appeal for final success to the wider circle of their friends in the same spirit of faith which, of itself, and in results already splendid, is a sufficient guarantee for the worth and permanence of the School at Athens.

OPEN LETTERS.

Indian Education in the South-west.

THE present demand of the friends of the Indians is for their immediate citizenship and settlement on lands owned in severalty, and the possession of all the legal rights of American citizens, including voting. It is also asked that the processes of education be used *after* this change of their condition, to make Indians equal with others in ability to maintain their possessions and improve their life. My recent experiences convince me that :

1. The value of the lands upon the South-west reservations has been misrepresented. My visits have carried me into the most distant and remarkable parts of the immense territory of New Mexico. They led me across the broad table-lands of Socorro and Lincoln counties, each as large as ordinary States, and over three lofty ranges of mountains in the South-east. One of these included the Cerro Blanco peak, which is said to be 14,269 feet above the sea. These plains and mountain-sides were waving with the richest kinds of grass a foot and a half high. Their surfaces were often crimsoned for miles with our cultivated flowers that require rich soil. Pine timber fifty feet high was growing upon the hillsides and in the natural parks, and clear streams were running from the mountains. In such a region Mescalero Apache reservation is placed. In the extreme north-west part of the territory and in Arizona, the mountain parks and great plains of the Navajo reservation were traversed as far as the famous Cañon de Chelly with twenty-six miles of marvellous sandstone walls, at the foot of which runs a broad stream, with scores of ancient cliff-dwellings clinging to their sides, and in the recesses of the cañon were plats of corn and beans and melons and flourishing peach orchards. These extensive mountain-tops had abundant timber and grass. The plains were sometimes very barren, but often cultivated with corn along the river-sides, and dotted with mud-covered huts made of poles and small branches of trees. On this reservation of 8,000,000 acres, one and a third times as large as the State of Maine, are feeding 1,200,000 sheep and goats and 75,000 horses, property of the patriarchal kind in which this tribe is rich.

2. The Apaches are probably the hardest, shrewdest, most warlike, agile, and capable of all the American Indians. In New Mexico and Arizona there are about 35,000, who speak nearly the same language. Of these 20,000 are Navajos, who have doubled in number within twenty years. From the plateau pierced by the tremendous gorge of De Chelly, we looked down on two thousand mounted Navajos gathered at the mouth of the cañon to witness a great medicine dance. On their finest horses and in their brightest array of costly blankets, gay leggins, and silver trappings, they swept across the plain like a whirlwind, a vision of Tartars in their charge. I addressed them for an hour on the education of their children and the change of their mode of life, to conform with the American people, who would soon come in like a flood to cover their lands and possess their country. Their intelligent faces and shrewd questions as to the benefits of an education which would make them like the rapacious, greedy, and murderous white men were very convincing of their ability. I could but believe that they were quite equal to the clever frontiersmen who sometimes shoot them for sport, though they live in utter ignorance and indifference to our civilization. I am sure that their tall, lithe, sinewy bodies would be a profitable addition to the physique of our nation.

3. The reservation system will never graduate the Indian out of barbarism unless through disgust with it by the tribes wholly supported by the Government, or through an enforced education of the tribes who are supporting themselves on the reservation. When the Indian can hunt or occasionally go on the war-path he can be made content with the feeding system, if he has enough to eat; but he is even then constantly moving his tepee or deserting his hogan, to satisfy his desire for roaming. To shut the Apaches up like sheep or horses in a corral and feed them in idleness from year to year is to aid and quicken the processes of natural selection by which they turn into civilized men, demons, or brutes. The men will break away from the reservation and seek self-support; the demons will find the way to all the atrocities of the war-

path till exterminated, and the brutes will sink into the apathy of all moral and manly qualities which breeds vice, disease, and death. We saw at the Mescallero agency every Saturday seventeen fat steers slaughtered, and seven thousand two hundred and twelve pounds of beef and four thousand one hundred pounds of flour distributed to one thousand two hundred and two Apaches changed from warriors into a crowd of beggarly dependents on the nation which they had ceased to fight. Their tepees were scattered over thirty square miles of hillsides and pine-covered grazing-fields, and moved every two or three weeks to save house-cleaning. These stalwart Indians had nothing to do but to gamble or ride from camp to camp and pester the agent every day for something to eat or to wear, or to watch the growth of their girls, who at the age of ten or twelve years will be sold for horses, to increase the number of wives of some old Apache, or be the first slave of an ambitious young man who need not woo, if he can buy a wife. Forty boys and half a dozen girls are, by threats of arrest by police, gathered into the agency boarding-school and there, separated from their parents, are well taught and trained under the supervision of the intelligent and efficient agent, Major Cowart. But out of his own experience he said emphatically to me, "No pupil taken away from these reservations to school ought *ever* to be permitted to return to sink again into their barbarism."

Some, however, are capable of disgust with such a life. Within a few weeks a hundred Jicarillas Apaches have cast the Government rations behind them, broken away from this reservation, and purchased cultivated lands north of Santa Fé, giving their horses in trade for them. They have put their girls at the Ramona School at Santa Fé to be educated for three years, and formed a colony which is erecting houses and making irrigating ditches to lands which shall furnish them with homes and food for self-support. This has been the effect, joined with other causes, of the leaven of education given to their boys and girls at Albuquerque and Santa Fé, and their own frequent observation of the progress of their children towards civilization. "I desire," said to me an old chief who had led in this movement, "to earn my bread by the sweat of my brow," expressively wiping his forehead, "and to live like a man."

But on a reservation like that of the Navajos and in a people so independent of Government aid, it is very difficult to stir any ambition for knowledge or for the civilized ways of American life. There the agency school gathers only about fifty out of seven thousand youths, and these are from the vicinity of the agency. To watch sheep and horses at eight years of age, to be sold or married at twelve, to shear flocks, to weave blankets, cultivate a little corn, build a hogan, and ride hundreds of miles to attend dances, is the life of the Navajo. How can they be made to feel any desire for anything higher? By offering the rewards authorized by the Indian office, their agent, Mr. Patterson, has persuaded twenty-two of this large tribe to begin the erection of houses and to locate lands. They do not, however, value farming implements or care for the improvements of their live stock, and generally refuse medical attendance. It is difficult to induce them by any rewards looking towards civilization. The invitations of the Government are disregarded and despised. Without compulsory measures such as are imposed

on white people in our country, these Indians will never rise from the slough of the reservation. A few may struggle out, but, if returned to their people, they will sink back where the majority live and die, a disgrace to the nation which from generation to generation holds them as its wards, whose shame it is forced to exhibit every year in the Indian Appropriation bill of Congress.

4. The education of Indian girls of these tribes is one of the first obligations of Christian philanthropy, because of the singular position which women hold among them. They regard their girls, who are sold so early for marriage, according to their value in horses. Yet among the Navajos, the brother or the uncle receives the price. As soon as marriageable, the fact is proclaimed. The Navajos, being polygamists, have no limit to the number of their wives, except in the number of horses they can spare for their purchase. But these women own the flocks of sheep they have been tending, and the wool is theirs at the shearing. They weave blankets with great skill, manufacture all their woolen garments, and sell the remainder of the wool. In 1886 they sold one million pounds. They therefore became influential not only by their skill but by their property. They have the right of voting as well as of discussion with the men in their councils, and also of divorcing themselves from their husbands. They keep control of their girls, build the hogans, and plant the fields. If these women shall be educated under Christian influences, the homes and children of the next generation cannot be savage. But the girls must be taken very early from the evil impressions of the reservation if they are to be truly civilized women. Since women are the progressive element of the Apache tribes, this power over barbarism should be seized upon in the first movements towards civilization.

In the Ramona School at Santa Fé the effort is made to separate the young Apache girls from the gross tendencies of barbarism, to which they are inevitably exposed when educated with Indian boys just taken from the camps. In later years co-education may be advantageous, but it cannot often be in the first stages of their progress towards civilized life, unless their teachers are perfectly familiar with their native language. When these girls have been transformed in their tastes by education and long familiarity with our manner of living, it will be safe and profitable to encourage their marriage to husbands likewise civilized, with whom they can begin life on land given to them by such legislation as is proposed in Senator Dawes's Land in Severalty bill. But let them begin citizenship with some qualifications for it, which the savage in his present condition does not possess.

5. It is time that the Indians of our own country were evangelized. Sixty-six tribes, numbering sixty-eight thousand and thirty-six, are still without a Christian missionary. Thirty-five thousand of these are the Navajo and other Apache tribes of New Mexico and Arizona. These American Indians have the claim of being our neighbors, our prisoners, our dependents, or our creditors, and nominally our fellow-citizens to whom we have been under the obligations of Christianity for a full century, but whom, at enormous expense, we have tried to slay rather than to save.

The Cosmic Day.

IN THE CENTURY for November, Principal Grant of Queen's University, Kingston, Canada, writing on the proposed adoption of a universal or Cosmic Day, said it had been objected that "it would be impossible for us to associate noon with seven o'clock instead of twelve." Allow me to refer those interested to Skeat (Concise Etymological Dictionary, second edition, p. 305), where under the word *nine* will be found the following: "Noon, midday (Latin), originally the ninth hour or 3 P. M., but afterward the time of the church service called *nones* was shifted to midday. We find Anglo-Saxon *nōntid* (literally noontide) the ninth hour, Mark xv. 33."

When the Cosmic Day is adopted — as it will be — the association of noon with twelve o'clock will fade from the public mind as its connection with nine o'clock has already been forgotten. The world does not stickle about correct nomenclature: who cares to remember that November, our eleventh month, really means the ninth month? I never heard of any confusion resulting from the rather unimaginative and at present incorrect naming of the months from September to December, not even in France, where a common contraction for the ninth month is *7^{bre}* (Eng. seven = French Sept.).

BRIC-À-BRAC.

A GOOD EXCUSE.

Brer Cato: "Whar's dat lazy rapsalcon Jeemes dat he ain' come to cut me dat load o' wood he promise me for dat pyah o' shoes I half-soled him?"

Sister Hester: "Well, brer, you mus' 'scuse Jeemes dis mornin', he's daid."

Love's Valentine.

I CAUGHT Love at a valentine.
 Beneath the wild grape's scented vine
 He sat, his winged and rosy feet
 Nestling 'mid beds of lilies sweet,
 His fillet loose, his lips a-pout,
 The roguish dimples quite frowned out.
 For Cupid fain would be at writing,
 And with a ring-dove's quill inditing
 Some pretty nonsense light as air,
 Some valentine to please his Fair.

But as I tiptoed near and nearer,
 All on a nonce his brow grew clearer;
 From lip to eye arch smiles ran races;
 Back danced the dimples to their places,
 And every soft, disheveled tress
 Grew pert and round with wantonness
 And tumbled over cheek and brow
 To watch him write. "But stop! How now!
 Stop, pilferer," I cried; "sad thief!
 That song thou tracest on the leaf,
 Myself did make." Laughed Love, "Quite right,
 And I, I stole it yester-night.
 For, entering on a red star's ray,
 And hovering round you where you lay,
 I robbed you of it while you slept.
 A pretty song!" Then up he leapt,
 Begged me to tie his fillet band,
 To bathe the ink-spots from his hand,
 To smooth afresh his ruffled wings,
 To tighten up his quiver strings,
 To say which smile became him best,
 And if his curls were neatly dressed.
 Each curl would be thrice over kissed,
 He vowed, by Sweeting, at the tryst.

Then blowing dimpled kisses three,
 Spread rosy wings, and left poor me
 Alone beneath the scented vine;
 Nor have I any Valentine
 To send thee, Sweet, since Love stole mine.

To Oliver Wendell Holmes.

ON READING "A MORTAL ANTIPATHY."

O POET, there's no twilight in your life:
 For you the morning ever brightly glows;
 You are not half the age you please to claim;
 You're only thirty, not a summer more.
 Perennial spring-time lingers in your heart,
 If one may judge you by your airy pen
 Whose flowers of fancy bloom but never fade.
 Most people claim they're younger than they are,
 And ape the pleasant ways of lusty youth,
 Even to the vainest of frivolities,
 To give their mimicry a truthful guise;
 But you affect great age and snowy hair
 Which to you do not properly belong.
 In you, it seems, there is a great big boy
 All bent for sport upon his grandsire's staff,
 And in his wig, as fleecy as a cloud,
 Rollicking through a noonday masquerade.
 But if you are as old as you pretend,
 And those white hairs are yours, why then you are
 Just like the rose-tree at my window-sill,
 Which is all gnarled and bent with changing years;
 But which bears roses still as beautiful,
 As red and luscious and as sweetly perfect,
 As those that clothed it in its earliest spring.

R. K. Munkittrick.

The Truth About Abra.

*Abra was ready ere I call'd her name;
 And, though I call'd another, Abra came!*

At first this delicate attention on Abra's part
 Gave keenest pleasure to his glowing heart.
 His love for Abra only stronger grew
 Through several months — perhaps a year or two.

But then there came a time when more and more
 Abra's intense attention was a bore.
 Much as he loved her, he was forced to own
 She oftentimes came when he would be alone.
 Her trick of coming "ere he called her name"
 Was pretty, certainly; but to his shame
 The fact must be admitted that when thus
 She came unbidden he was apt to fuss.

When, for example, he would fain in sleep
 His troubled mind and weary body steep;
 When solitude was what he most desired,
 And the mere thought of talking made him tired:
 At such a time as this he came to dread
 Abra's unasked attendance at his bed,
 And Abra's murmur: "Yes, I know, my dear,
 You didn't call me — but, you see, I'm here."

Yet if her uncalled comings were a curse,
 Her comings in the place of other folks were worse.
 When of a morning, he would call his man
 To bring his tub and fill his water can,
 Imagine as you may his righteous wrath
 At finding Abra — where he sought his bath!
 At hearing Abra, simpering, make reply:
 "You called for John, my love, but here am I."

This sort of thing, in time, became so bad,
 That Abra's comings almost drove him mad.
 Long as he might for but an hour alone,
 No single moment could he call his own.
 At any instant, as he full well knew,
 Might Abra dart, unasked, upon his view.
 'Twas useless, too, to call another's name —
 For "though he called another, Abra came."

Living this life of constant, racking dread,
 His vital forces soon entirely fled.
 He had been tough and hearty, hale and strong —
 His nervous system went completely wrong;
 He grew dyspeptic; lost his taste for food,
 And more and more society eschewed.

And when, at last, he prayed for death's release,
 E'en Death could not afford him death in peace.
 For when he called on Death — "another's name" —
 Abra (he knew she'd do it!) — Abra came!

Thomas A. Janvier.

One Exception.

"I LIKE the ladies very much," —
 "And so I thought," she said,
 But inly feared the name of *one*
 Was running in his head.

She laughed out then this paradox,
 As if in merest fun —
 "I'd rather you would like them all,
 Than like a single one!"

("But me,") she added in her thought —
 To say it wouldn't do;
 So leaping past her modest mouth
 Out of her eyes it flew.

I.

A STRANGER.

FROM College Point to Bell's Point, sixty miles above New Orleans, the Mississippi runs nearly from west to east. Both banks, or "coasts," are lined with large and famous sugar plantations.

Midway on the northern side lie the beautiful estates of "Belmont" and "Belle Alliance." Early one morning in the middle of October, 1878, a young man whose age you would have guessed fifteen years too much stood in scrupulously clean, ill-fitting, flimsy garments on the strong, high levee overlooking these two plantations. He was asking the way to a place called Grande Pointe. Grand Point, he called it, and so may we: many names in Louisiana that retain the French spelling are habitually given an English pronunciation.

A tattered negro mounted on a sunburnt, unshod, bare-backed mule down in the dusty gray road on the land side of the embankment was his only hearer. Fifteen years earlier these two men, with French accents, strangers to each other, would hardly have conversed in English; but the date made the difference. We need not inexorably render the dialect of the white man; pretty enough to hear, it would often be hideous to print. The letter *r*, for instance, that plague of all nations — before consonants it disappeared; before vowels the tongue failed of that upward curve that makes the good strong *r*'s of Italy and Great Britain.

The negro pointed over his mule's ears.

"You see Belle Alliance sugah-house yon-

deh? Well, behine dah you fine one road go stret thoo the plantation till de wood. Dass 'bout mile, you know. Den she keep stret on thoo de wood 'bout two mile' mo', an' dat fetch you at Gran' Point'. Hole on; I show you."

The two men started down the road, the negro on his mule, the stranger along the levee's crown. "Dat Gran' Point'," resumed the black, "'tain't no point on de riveh, you know, like dat Bell' Point, w'at you see yondeh 'twixt dem ah batture willows whah de sun all spread out on the wateh; no, seh. 'Tis jis lil place back in de *swamp*, raise' 'bout five, six feet 'bove de wateh. Yes, seh; 'bout t'ree mile' long, 'alf mile wide. Don't nobody but Cajun* live back deh. Seem droll you goin' yondeh."

"'Tis the reason I go," said the other without looking up.

"Yes, seh." — A short silence. — "Dass nigh fifty year', now, dat place done been settle'. Ole 'Mian Roussel he was gret hunter. He know dat place. He see 'tis rich groun'. One day he come dare, cut some tree', buil' house, plant lil tobahcah. Nex' year come ole man Le Blanc; den Poché, den St. Pierre, den Martin, — all Cajun'. Oh! dass mo'n fifty year' 'go. Dey all comes from dis yeh riveh coast; 'caze de rich Creole', dey buy 'em out. Yes, seh, dat use' be de *Côte Acadien'*, right yeh whar yo' feet stan'in' on. *C'est la côte Acadien', just ici, oui.*" The trudging stranger waived away the right of translation. He had some reason for preferring English. But his manner was very gentle, and in a moment the negro began again.

"Gret place, dat Gran' Point'. Yes, seh; fo' tobahcah. Dey make de bes' Périque tobahcah in de worl'. Yes, seh, right yond' at Gran' Point'; an' de bes' Périque w'at come from Gran' Point', das de Périque of Octave Roussel, w'at dey use call 'im Chatoué;†

* Acadians.

† Raccoon.

but he git tired dat name, and now he got lil boy 'bout twenny-five year' ole, an' dey call de ole man Catou, an' call his lil *boy* Chatoué. Dey fine dat wuck mo' betteh. Yes, seh. An' he got bruddeh name' 'Mian Roussel. But dat not de ole, ole 'Mian—like dey say de ole he one. 'Caze, you know, he done peg out. Oh, yes, he peg out in de du'in' o' de waugh.* But he lef' heap-sight chillen; you know, he got a year' staht o' all de res', you know. Yes, seh. Dey got 'bout hund'ed fifty peop' yond' by Gran' Point', and sim like dey mos' all name Roussel. *Sim* dat way to *me*. An' ev'y las' one got lil fahm so lil you can't plow her; got dig her up wid a spade. Yes, seh, same like you diggin' grave; yes, seh."

The gentle stranger interrupted, still with-

*During the war.

out lifting his eyes from the path. "'Tis better narrowness of land than of virtue." The negro responded eagerly:

"Oh, dey good sawt o' peop', yes! Dey deals fair an' dey deals square. Dey keeps de peace. Dass 'caze dey mos'ly don't let whisky git on deir blin' side, you know. Dey *does* love to dance, and dey marries mawnstus young; but dey not like some niggehs: dey stays married. An' modess? Dey des so modess dey shy! Yes, seh, dey de shy'es', easy-goin'es', modesses', most p'esumin' peop' in de whole worl'! I don't see fo' why folks talk 'gin dem Cajun'; on'y dey a lil' bit slow."

The traveler on the levee's top suddenly stood still, a soft glow on his cheek, a distention in his blue eyes. "My friend, what was it, the first American industry? Was it not the

HE WAS ASKING THE WAY TO A PLACE CALLED GRANDE POINTE.

"SIRS, HAVE I ALREADY REACH GRAN' POINT'?"

Newfoundland fisheries? Who inaugurate them if not the fishermen of Normandy and Bretagne? And since how long? Nearly four hundred years!"

"Dass so, boss," exclaimed the negro with the promptitude of an eye-witness; but the stranger continued:

"The ancestors of the Acadian—they are the fathers of the codfish!" He resumed his walk.

"Dass so, seh; dass true. Yes, seh, you talkin' mighty true; dey a pow'ful ancestrified peop', dem Cajun'; dass w'at make dey so shy, you know. An' dey mighty good han' in de sugah-house. Dey des watchin', now, w'en dat sugah-cane git ready fo' biggin to grind; so soon dey see dat, dey des come a-lopin' in

here to Mistoo Wallis' sugah-house here at Belle Alliance, an' likewise to Marse Louis Le Bourgeois yond' at Belmont. You see! de fust t'ing dey gwine ass you when you come at Gran' Point'—'Is Mistoo Wallis biggin to grind?' Well, seh, like I tell you, yeh de sugah-house, an' dah de road. Dat road fetch you at Gran' Point'."

II.

IN A STRANGE LAND.

AN hour later the stranger, quite alone, had left behind him the broad smooth road, between rustling walls of sugar-cane, that had brought him through Belle Alliance plan-

EVENING AT GRANDE POINTE.

tation. The way before him was little more than a bridle-path along the earth thrown up beside a draining ditch in a dense swamp. The eye could run but a little way ere it was confused by the tangle of vegetation. The trees of the all-surrounding forest — sweet-gums, water-oaks, magnolias — cast their shade obliquely along and across his way, and wherever it fell the undried dew still sparkled on the long grass.

A pervading whisper seemed to say good-bye to the great human world. Scarce the note of an insect joined with his footsteps in the coarse herbage to break the stillness. He made no haste. Ferns were often about his feet, and vines were both there and everywhere. The soft blue tufts of the *ageratum* were on each side continually. Here and there in wet places clumps of Indian-shot spread their pale scroll leaves and sent up their green and scarlet spikes. Of stature greater than his own the golden-rod stood, crested with yellow plumes, unswayed by the still air. Often he had to push apart the brake-canes and press through with bowed head. Nothing met him in the path. Now and then there were faint signs underfoot as if wheels might have crushed the ragged turf long weeks before. Now and then the print of a hoof was seen in the black soil, but a

spider had made it her home and spread across it her silken snares. If he halted and hearkened, he heard far away the hawk screaming to his mate, and maybe, looking up, caught a glimpse of him sailing in the upper air with the sunlight glowing in his pinions; or in some bush near by heard the soft rustle of the wren, or the ruffling whiff and nervous "chip" of the cardinal, or saw for an instant the flirt of his crimson robes as he rattled the stiff, jagged fans of the palmetto.

At length the path grew easier and lighter, the woods on the right gave place to a field half claimed for cotton and half given up to persimmon saplings, blackberry bushes, and rampant weeds. A furry pony with mane and tail so loaded with cockleburs that he could not shake them, lifted his head and stared. A moment afterward the view opened to right and left, and the path struck a grassy road at right angles and ended. Just there stood an aged sow.

"Unclean one," said the grave wayfarer, "where dwells your master? — Ignore you the English tongue? But I shall speak not in another; 'tis that same that I am arriving to bring you."

The brute, with her small bestial eye fixed on him distrustfully and askance, moved enough to the right to let him pass on the

other hand, and with his coat on his arm — so strong was the October sun — he turned into the road westward, followed one or two of its slight curves, and presently saw neat fields on either hand walled in on each farther side by the moss-hung swamp; and now a small, gray, unpainted house, then two or three more, the roofs of others peering out over the dense verdure, and down at the end of the vista a small white spire and cross. Then, at another angle, two men seated on the roadside. Their diffident gaze bore that look of wild innocence that belongs to those who see more of dumb nature than of men. Their dress was homespun. The older was about fifty years old, the other much younger.

"Sirs, have I already reach Gran' Point'?"

The older replied in an affirmative that could but just be heard, laid back a long lock of his straight brown hair after the manner of a short-haired girl, and rose to his feet.

"I hunt," said the traveler slowly, "Mr. Maximian Roussel."

A silent bow.

"'Tis you?"

The same motion again.

The traveler produced a slip of paper folded once and containing a line or two of writing hastily penciled that morning at Belle Alliance. Maximian received it timidly and held it helplessly before his downcast eyes with the lines turned perpendicularly, while the pause grew stifling, and until the traveler said:

"'Tis Mr. Wallis make that introduction."

At the name of the owner of the beautiful plantation the man who had not yet spoken rose, covered with whittlings. It was like a steer getting up out of the straw. He spoke.

"M'sieu' Walleece, *a commencé à mouliner*? Is big-in to gryne?"

"He shall commence in the center of the next week."

Maximian's eyes rose slowly from the undeciphered paper. The traveler's met them. He pointed to the missive.

"The schoolmaster therein alluded — 'tis me."

"Oh!" cried the villager joyously, — "*maître d'école!* — schooltitcher!"

"But," said the stranger, "not worthy the title." He accepted gratefully the hand of one and then of the other.

"Walk een!" said Maximian, "all hand', walk een house." They went, Indian file, across the road, down a sinuous footpath, over a stile, and up to his little single-story unpainted house, and tramped in upon the railed galerie.

"*Et M'sieu' Le Bourgeois*," said the host, as the schoolmaster accepted a split-bottomed chair, "he's big-in to gryne?"

Within this ground-floor veranda — chief

appointment of all Acadian homes — the traveler accepted a drink of water in a blue tumbler, brought by the meek wife. The galerie just now was scattered with the husband's appliances for making Périque tobacco into "carats" — the carat-press. Its small, iron-ratcheted, wooden windlass extended along the top rail of the balustrade across one of the galerie's ends. Lines of half-inch grass rope, for wrapping the carats into diminished bulk and solid shape, lay along under foot. Beside one of the doors, in deep hickory baskets, were the parcels of cured tobacco swaddled in cotton cloths and ready for the torture of ropes and windlass. From the joists overhead hung the pods of tobacco seed for next year's planting.

111.

THE HANDSHAKING.

THERE was news in Grande Pointe. The fair noon sky above, with its peaceful flocks of clouds; the solemn, wet forest round about; the harvested fields; the disheveled, fragrant fallows; the reclining, ruminating cattle; the little chapel of St. Vincent de Paul in the midst, open for mass once a fortnight, for a sermon in French four times a year, — these were not more tranquil in the face of the fact that a schoolmaster had come to Grande Pointe to *stay* than outwardly appeared the peaceful-minded villagers. Yet as the tidings floated among the people, touching and drifting on like thistle-down, they were stirred within, and came by ones, by twos, slow-stepping, diffidently smiling, to shake hands with the young great man. They wiped their own before offering them — the men on their strong thighs, the women on their aprons. Children came, whose courage would carry them no nearer than the galerie's end or front edge, where they lurked and hovered, or gazed through the balustrade, or leaned against a galerie post and rubbed one brown bare foot upon another and crowded each other's shoulders without assignable cause, or lopped down upon the grass and gazed from a distance.

Little conversation was offered. The curiosity was as unobtrusive as the diffidence was without fear; and when a villager's soft, low speech was heard, it was generally in answer to inquiries necessary for one to make who was about to assume the high office of educator. Moreover, the schoolmaster revealed, with all gentleness, his preference for the English tongue, and to this many could only give ear. Only two or three times did the conversation rise to a pitch that kindled even the ready ardor of the young man of letters. Once,

SIDONIE.

after a prolonged silence, the host, having gazed long upon his guest, said, without preface :

"Tough job you got," and waved a hand toward the hovering children.

"Sir," replied the young scholar, "is it not the better to do whilse it is the mo' tough? The mo' toughness, the mo' honor." He rose suddenly, brushed back the dry, brown locks of his fine hair, and extending both hands, with his limp, straw hat dangling in one, said: "Sir, I will ask you, is not the schoolmaster the true patriot? Shall his honor be less than of the soldier? Yet I ask not honor; for me, I am not fit; yet, after my poor capacities—" He resumed his seat.

An awesome quiet followed. Then some one spoke to him, too low to be heard. He bent forward to hear the words repeated, and 'Mian said for the timorous speaker :

"Aw, dass nut'n; he jis only say, 'Is M'sieu' Walleece big-in to gryne?'"

Few tarried long, though one man—he whom the schoolmaster had found sitting on the roadside with Maximian—staid all day; and even among the villagers themselves there was almost no loquacity. Maximian, it is true, as the afternoon wore along, and it seemed plain that the reception was a great and spontaneous success, spoke with growing frequency and heartiness; and, when the guest sat down alone at a table within, where *la vieille*—the wife—was placing half a dozen still sputtering fried eggs, a great wheaten loaf, a yellow gallon bowl of boiled milk, a pewter ladle, a bowie knife, the blue tumbler, and a towel, and out on the galerie the callers were still coming, his simple neighbors pardoned the elation that led him to take a chair himself a little way off, sit on it sidewise, cross his legs gayly, and with a smile and wave of his good brown hand say :

"*Servez-vous!* He'p you'se'f! Eat much you like till you well up!"

Even he asked no questions. Only near the end of the day, when the barefoot children by gradual ventures had at length gathered close about and were softly pushing for place on his knees and huddling under his arms, and he was talking French,—the only language most of them knew,—he answered the first personal inquiry put to him since arriving. "His name," he replied to the tiny, dark, big-eyed boy who spoke for his whispering fellows, "his name was Bonaventure—Bonaventure Deschamps."

As the great October sun began to dip his crimson wheel behind the low black line of swamp and the chapel cross stood out against a band of yellow light that spanned the west, he walked out to see the village, a little girl on either hand and little boys round about. The

children talked apace. Only the girl whose hand he held in his right was mute. She was taller than the rest; yet it was she to whom the little big-eyed boy pointed when he said, vain of his ability to tell it in English :

"I don't got but eight year' old, me. I'm gran' for my age; but she, she not gran' for her age—Sidonie; no; she not gran' at all for *her* age."

They told the story of the chapel: how some years before, in the Convent of the Sacred Heart, at the parish seat a few miles away on the Mississippi, a nun had by the pope's leave cast off the veil; how she had come to Grande Pointe and taken charge of her widowed brother's children; and how he had died, and she had found means, the children knew not how, to build this chapel. And now she was buried under it, they said. It seemed, from what they left unsaid as well as what they said, that the simple influence of her presence had kindled a desire for education in Grande Pointe not known before.

"Dass my *tante*—my hant. She *was* my hant befo' she die'," said the little man of eight years, hopping along the turf in front of the rest. He dropped into a walk that looked rapid, facing round and moving backward. "She learn me English, my *tante*. And she try to learn Sidonie; but Sidonie, Sidonie fine that too strong to learn, that English, Sidonie." He hopped again, talking as he hopped and holding the lifted foot in his hand. He could do that and speak English at the same time, so talented was Toutou.

Thus the sun went down. And at Maximian's stile again Bonaventure Deschamps took the children's cheeks into his slender fingers and kissed them, one by one, beginning at the least and so up, slowly, toward Sidonie Le Blanc. With very earnest tenderness it was done, some grave word of inspiration going before each caress; but when at last he said, "To-morrow, dear chil'run, the school-bell shall ring in Gran' Point'!" and turned to finish with Sidonie—she was gone.

IV.

HOW THE CHILDREN RANG THE BELL.

WHERE the fields go wild and grow into brakes and the soil becomes fenny, on the north-eastern edge of Grande Pointe, a dark, slender thread of a bayou moves loiteringly north-eastward into a swamp of huge cypresses. In there it presently meets another like itself, the Bayou Tchackchou, slipping around from the little farm village's eastern end as silently as a little mother comes out of a bower where she has just put her babe

to sleep. A little further on they are joined as noiselessly by Blind River, and the united waters slip on northward through the dim, colonnaded, watery-floored, green-roofed, blue-vapored, moss-draped wilderness, till in the adjoining parish of Ascension they curve around to the east and issue into the sunny breadth of Lake Maurepas. Thus they make the Bayou des Acadiens. From Lake Maurepas one can go up Amite or Tickfaw River, or to Pass Manchac or Pontchatoula, anywhere in the world, in fact,—where a canoe can go.

On a bank of this bayou, no great way from Grande Pointe, but with the shadow of the swamp at its back and a small, bright prairie of rushes and giant reeds stretching away from the opposite shore, stood, more in the water than on the land, the palmetto-thatched fishing and hunting lodge and only home of a man who on the other side of the Atlantic you would have known for a peasant of Normandy, albeit he was born in that swamp,—the man who had tarried all day at the schoolmaster's handshaking.

What a day that had been! Once before he had witnessed a positive event. That was when, one day, he journeyed purposely to the levee of Belle Alliance, waited from morning till evening, and at last saw the steamer *Robert E. Lee* come by and, as fortune would have it, land! loaded with cotton from the water to the hurricane deck! He had gone home resolved from that moment to save his money and be something more than he was.

But that event had flashed before his eyes and in a quarter hour was gone, save in his memory. The coming of the schoolmaster, all unforeseen, had lasted a day, and he had seen it from beginning to end. All day long on 'Mian's galerie, standing now here, now there, he had got others to interpret for him, where he could not guess, the meanings of the wise and noble utterances that fell now and then from the lips of the young soldier of learning, and stored them away in his now greedy mind.

One saying in particular, whose originality he did not dream of questioning, took profound hold of his conviction and admiration; and two or three times as his canoe glided homeward in the twilight, its one long, smooth ripple gleaming on this side and that as it stretched away toward the bayou's dark banks, he rested for a moment on his tireless paddle and softly broke the silence of the wilderness with its three simple words, so trite to our ears, so strange to his:

"Knowledge is power."

In years he was but thirty-five, but he was a widower, and the one son who was his

only child and companion would presently be fourteen.

"Claude," he said, as they rose that evening from their hard supper in the light and fumes of their small kerosene-lamp, "*I' faut z-ahler coucher.*" (We must go to bed.)

"*Quofoir?*" asked the sturdy lad. (*Pour quoi? Why?*)

"Because," replied the father in the same strange French in which he had begun, "at daybreak to-morrow, and every day thereafter, you must be in your dug-out on your way to Grande Pointe, to school. My son, you are going to learn how to read!"

So came it that, until their alphabetical rearrangement, the first of all the thirty-five names on the roll was Claude St. Pierre, and that every evening thenceforward when that small kerosene-lamp glimmered in the deep darkness of Bayou des Acadiens, the abecedarian Claude was a teacher.

But even before the first rough roll was made he was present, under the little chapel tower, when for the first time its bell rang for school. The young master was there, and all the children; so that really there was nothing to ring the bell for. They could, all together, have walked quietly across the village green to the forlorn tobacco-shed that 'Mian had given them for a school-house and begun the session. Ah! say not so! It was good to ring the bell. A few of the stronger lads would even have sent the glad clang abroad before the time, but Bonaventure restrained them. For one thing, there must be room for every one to bear a hand. So he tied above their best reach three strands of "carat" cord to the main rope. Even then he was not ready.

"No, dear chil'run; but grasp hold, every one, the ropes, the cawds,—the shawt chil'run reaching up shawtly, the long chil'run the more longly."

Few understood his words, but they quietly caught the idea and yielded themselves eagerly to his arranging hand. The highest grasp was Claude's. There was a little empty space under it, and then one only of Sidonie's hands, timid, smooth, and brown. And still the master held back the word.

"Not yet! not yet! The pear is not ripe!" He stood apart from them, near the chapel door, where the light was strong, his silver watch open in his left hand, his form erect, his right hand lifted to the brim of his hat, his eyes upon the dial.

"Not yet, dear chil'run. Not yet. Have the patience. Hold every one in his aw her place. Be ready! Have the patience." But at length when the little ones were frowning and softly sighing with the pain of upheld arms, their waiting eyes saw his dilate. "Be ready!" he

said, with low intensity: "Be ready!" He soared to his tiptoes, the hat flounced from his head and smote his thigh, his eyes turned upon them blazing, and he cried, "Ring, chil'-run, ring!"

The elfin crew leaped up the ropes and came crouching down. The bell pealed; the master's hat swung round his head. His wide eyes were wet, and he cried again, "Ring! ring! for God, light, libbutty, education!" He sprang toward the leaping, sinking mass; but the right feeling kept his own hands off. And up and down the children went, the bell answering from above, peal upon peal; when just as they had caught the rhythm of Claude's sturdy pull and the bell could sound no louder, the small cords gave way from their fastenings, the little ones rolled upon their backs, the bell gave one ecstatic double clang and turned clear over, the swift rope straightened upward from its coil, and Claude and Sidonie, her hands clasped upon each other about the rope and his hands upon hers, shot up three times as high as their finest leap could have carried them. For an instant they hung; then with another peal the bell turned back and they came blushing to the floor. A swarm of hands darted to the rope, but Bonaventure's was on it first.

"'Tis sufficient!" he said, his face all triumph. The bell gave a lingering clang or two and ceased, and presently the happy company walked across the green. "Sufficient," the master had said; but it was more than sufficient. In that moment of suspension, with Sidonie's great brown frightened eyes in his, and their four hands clasped together, Claude had learned, for his first lesson, that knowledge is not the only or the greatest power.

v.

INVITED TO LEAVE.

AFTER that, every school-day morning Claude rang the bell. Always full early his pirogue came gliding out of the woods and up through the bushy fen to the head of canoe navigation and was hauled ashore. Bonaventure had fixed his home near the chapel and not far from Claude's hiding-place. Thus the lad could easily come to his door each morning at the right moment—reading it by hunter's signs in nature's book—to get the word to ring. There were none of the usual reasons that the schoolmaster should live close to the school-house. There was no demand for its key.

Not of that school-house! A hundred feet length by twenty-five breadth, of earth-floored, clapboard-roofed, tumbling shed rude-

ly walled with cypress split boards,—*pieux*,—a hand-breadth space between every two, stood endwise in the earth, like palisades, sunlight and fresh air and the gleams of green fields coming in; the scores of little tobacco-presses that had stood in ranks on the hard earth floor, the great sapling levers, and the festoons of curing tobacco that had hung from the joists overhead, all removed, only the odor left; bold gaps here and there in the *pieux*, made by that mild influence which the restless call decay, and serving for windows and doors; the eastern end swept clean and occupied by a few benches and five or six desks, strong, home-made, sixty-four pounders.

Life had broadened with Claude in two directions. On one side opened, fair and noble, the acquaintanceship of Bonaventure Deschamps, a man who had seen the outside world, a man of books, of learning, a man who could have taught even geography, had there been any one to learn it; and on the other side, like a garden of roses and spices, the schoolmateship of Sidonie Le Blanc. To you and me she would have seemed the merest little brown bud of a thing, almost nothing but two big eyes—like a little owl. To Claude it seemed as though nothing older or larger could be exactly in the prime of beauty; the path to learning was the widest, floweriest, fragrantest path he had ever trod.

Sidonie did not often speak with him. At recess she usually staid at her desk, studying, quite alone but for Bonaventure silently busy at his, and Claude himself, sitting farther away, whenever the teacher did not see him and drive him to the playground. If he would only drive Sidonie out! But he never did.

One day, after quite a contest of learning, and as the hour of dismissal was scattering the various groups across the green, Toutou, the little brother who was grand for his age, said to Claude, hanging timidly near Sidonie:

"*Alle est plus smart' que vous.*" (She is smarter than you.)

Whereupon Sidonie made haste to say in their Acadian French, "Ah! Master Toutou, you forget we went to school to our dear aunt. And besides, I am small and look young, but I am nearly a year older than Claude." She had wanted to be kind, but that was the first thorn. Older than he!

And not only that; nearly fifteen! Why, at fifteen—at fifteen girls get married! The odds were heavy. He wished he had thought of that at first. He was sadly confused. Sometimes when Bonaventure spoke words of enthusiasm and regard to him after urging him fiercely up some hill of difficulty among the bristling heights of English pronunciation, he yearned to seek him alone and tell him this

difficulty of the heart. There was no fear that Bonaventure would laugh; he seemed scarce to know how; and his smiles were all of tenderness and zeal. Claude did not believe the ten years between them would matter; had not Bonaventure said to him but yesterday that to him all loveliness was the lovelier for being very young? Yet when the confession seemed almost on Claude's lips it was driven back by an alien mood in the master's face. There were troubles in Bonaventure's heart that Claude wot not of.

One day who should drop in just as school was about to begin but the priest from College Point. Such order as he found! Bonaventure stood at his desk like a general on a high hill, his large hand-bell in his grasp, passed his eyes over the seventeen demure girls, with their large, brown-black, liquid eyes, their delicately penciled brows, their dark, waveless hair, and sounded one tap! The sport outside ceased, the gaps at the shed's farther end were darkened by small forms that came darting like rabbits into their burrows, eighteen small hats came off, and the eighteen boys came softly forward and took their seats. Such discipline!

"Sir," said Bonaventure, "think you 'tis arising f'om the strickness of the teacher? 'Tis f'om the goodness of the chil'run! How I long the State Sup'inten'ent Public Education to see them!"

The priest commended the sight and the wish with smiling affirmations that somehow seemed to lack sympathy. He asked the names of two or three pupils. That little fellow with soft, tanned, chubby cheeks and great black eyes, tiny mouth, smooth feet so shapely and small, still wet to their ankles with dew, and arms that he could but just get folded, was Toutou. That lad with the strong shoulders, good wide brows, steady eye, and general air of manliness,—that was Claude St. Pierre. And this girl over on the left here,—“You observe,” said Bonaventure, “I situate the lambs on the left and the kids on the right,”—this little, slender crescent of human moonlight, with her hair in two heavy, black, down-falling plaits, meek, drooping eyes, long lashes, soft, childish cheeks and full throat, was Sidonie Le Blanc. Bonaventure murmured:

“Best scholah in the school, yet the *only* — that loves not her teacher. But I give always my interest, not according to the interestingness, but rather to the necessitude, of each.”

The visit was not long. Standing, about to depart, the visitor seemed still, as at the first, a man of many reservations under his polite smiles. But just then dropping a phrase that the teacher recognized as an indirect quotation, Bonaventure cried, with greedy eyes:

“You have read Victor Hugo?”

“Yes.”

“Oh, sir, that grea-a-at man! That father of libbutty! Other patriots are the sons, but he the father! Is it not thus?”

The priest shrugged and made a mouth. The young schoolmaster's face dropped.

“Sir, I must ask you — is he not the frien' of the poor and downtrod?”

The visitor's smile quite disappeared. He said:

“Oh!” — and waved a hand impatiently; “Victor Hugo” — another mouth — “Victor Hugo” — replying in French to the schoolmaster's English — “is not of my party.” And then he laughed unpleasantly and said good-day.

The State Superintendent did not come, but every day — “It is perhaps he shall come to-mo'w, chil'run; have yo' lessons well!”

The whole tiny army of long, blue cottonade pantalettes and pantaloons tried to fulfill the injunction. Not one but had a warm place in the teacher's heart. But Toutou, Claude, Sidonie, anybody who glanced into that heart could see sitting there enthroned. And some did that kind of reconnoitering. Catou, 'Mian's older brother, was much concerned. He saw no harm in a little education, but took no satisfaction in the introduction of English speech; and speaking to 'Mian of that reminded him to say he believed the schoolmaster himself was aware of the three children's preëminence in his heart. But 'Mian only said:

“*Ah bien, c'est all right, alors!*” (Well, then, it's all right.) Whether all right or not, Bonaventure was aware of it, and tried to hide it under special kindnesses to others, and particularly to the dullard of the school, grandson of Catou and nicknamed *Crébiche*.* The child loved him; and when Claude rang the chapel bell, and before its last tap had thrilled dreamily on the morning air, when the urchins playing about the school-house espied another group coming slowly across the common with Bonaventure in the midst of them, his coat on his arm and the children's hands in his, there among them came *Crébiche*, now on one side, now running round to the other, hoping so to get a little nearer to the master.

“None shall have such kindness to-day as thou,” Bonaventure would silently resolve as he went in through a gap in the *pieux*. And the children could not see but he treated them all alike. They saw no unjust inequality even when, *Crébiche* having three times spelt earth with an *u*, the master paced to and fro on the bare ground among the unmatched desks and break-back benches, running his hands through his hair and crying:

“Well! well aht thou name' the crawfish;

* *Écrevisse*, crawfish.

EVERY SCHOOL-DAY MORNING CLAUDE RANG THE BELL.

with such rapiditive celeritude dost thou progress backwardly !”

It must have been to this utterance that he alluded when at the close of that day he walked, as he supposed, with only birds and grasshoppers for companions, and they grew still, and the turtle-doves began to moan, and he smote his breast and cried :

“ Ah ! rules, rules ! how easy to make, likewise break ! Oh ! the shame, the shame ! If Victor Hugo had seen that ! And if George Washington ! But thou,” — some one else, not mentioned, — “ thou sawedst it !”

The last word was still on the speaker’s lips, when — there beside the path, with heavy eye and drunken frown, stood the father of Crébiche, the son of Catou, the little boy of twenty-five known as Chatoué. He spoke :

“ To who is dat you speak ? Talk wid de dev’ ? ”

VOL. XXXIII.— 85*.

Bonaventure murmured a salutation, touched his hat, and passed. Chatoué moved a little and delivered a broadside :

“ Aftéh dat, you bettéh leave ! Yes, you bettéh leave Gran’ Point’ ! ”

“ Sir,” said Bonaventure, turning with flushed face, “ I stay.”

“ Yes,” said the other, “ dass righ’ ; you bettéh go way and stay. *Magicien*,” he added as the schoolmaster moved on, “ *sorcier* ! — Vou-dou ! — jackass ! ”

What did all this mean ?

VI.

WAR OF DARKNESS AND LIGHT.

CATOU, it seems, had gone one day to College Point with a pair of wild ducks that he had shot, — first of the season, — and offered

them to the priest who preached for Grande Pointe once a quarter:

"Catou," said the recipient, in good French but with a cruel hardness of tone, "why does that man out there teach his school in English?" The questioner's intentions were not unkind. He felt a protector's care for his Acadian sheep, whose wants he fancied he, if not he only, understood. He believed a sudden overdose of enlightenment would be to them

those books that your children are rubbing their noses in? Yankees! Oh, I doubt not they have been sharp enough to sprinkle a little of the stuff *they* call religion here and there in them; 'tis but the bait on the hook! But you silly 'Cadians think your children are getting education, and that makes up for everything else. Do you know what comes of it? Discontent. Vanity. Contempt of honest labor. Your children are going to be discontented with

CATOU AND THE PRIEST.

a real disaster, and he proposed to save them from it by the kind of management they had been accustomed to — they and their fathers — for a thousand years.

Catou answered the question only by a timid smile and shrug. The questioner spoke again:

"Why do you Grande Pointe folk allow it? Do you want your children stuffed full of American ideas? What is in those books they are studying? You don't know? Neither do I. I would not look into one of them. But you ought to know that to learn English is to learn free-thinking. Do you know who print

their lot. It will soon be good-bye to sun-bonnets; good-bye to homespun; good-bye to Grande Pointe,—yes, and good-bye to the faith of your fathers. Catou, what do you know about that man, anyhow? You ask him no questions, you 'Cadians, and he — oh, he is too modest to tell you who or what he is. *Who pays him?*"

"He say pay is way behine. He say he don't get not'in' since he come yondeh," said Catou, the distress that had gathered on his face disappearing for a moment.

The questioner laughed contemptuously.

"CLAUDE, TELL THE YOUNG SCHOOLMASTER."

"Do you suppose he works that way for nothing? How do you know, at all, that his real errand is to teach school? A letter from Mr. Wallis! who simply told your simple-minded brother what the fellow told him! See here, Catou; you owe a tax as a raiser of tobacco, eh? And besides that, hasn't every one of you an absurd little sign stuck up on the side of his house, as required by the Government, to show that you owe another tax as a tobacco manufacturer? But still you have a little arrangement to neutralize that, eh? How do you know this man is not among you to look into that? Do you know that he *can* teach? No wonder he prefers to teach in English? I had a conversation with him the other day; I want no more; he preferred to talk to me in English. That is the good manners he is teaching; light-headed, hero-worshipping, free-thinker that he is."

Catou was sore dismayed. He had never heard of hero-worship or free-thinking before, but did not doubt their atrocity. It had never occurred to him that a man with a few spelling-books and elementary readers could be so dangerous to society.

"I wish he clear out from yondeh," said Catou. He really made his short responses in French, but in a French best indicated in bad English.

"Not for my sake," replied the priest, coldly smiling. "I shall just preach somewhere else on the thirteenth Sunday of each quarter, and let Grande Pointe go to the devil; for there is where your new friend is sure to land you. Good-day, I am very busy this morning."

These harsh words — harsh barking of the shepherd dog — spread an unseen consternation in Grand Pointe. Maximian was not greatly concerned. When he heard of the

threat to cut off the spiritual table-crums with which the villagers had so scantily been fed, he only responded that in his opinion the dominie was no such a fool as that. But others could not so easily dismiss their fears. They began to say privately, leaning on fences and lingering at stiles, that they had felt from the very day of that first mad bell-ringing that

the place like the waters of a rising tide. All Grande Pointe was lifting from the sands, and in danger of getting afloat and drifting toward the current of the great world's life. Personally, too, the schoolmaster seemed harmless enough. From the children and he loving each other, the hearts of the seniors had become entangled. The children had come home from the

"SIRS, WELCOME TO GRAN' POINT' SCHOOL."

the whole movement was too headlong; that this opening the sluices of English education would make trouble. Children shouldn't be taught what their parents do not understand. Not that there was special harm in a little spelling, adding, or subtracting, but — the notions they and the teacher produced! Here was the school's influence going through all

atmosphere of that old tobacco-shed and persuaded the very grandmothers to understand vaguely — very vaguely and dimly — that the day of liberty which had come to the world at large a hundred years before had come at last to them; that in France their race had been peasants; in Acadia, forsaken colonists; in Massachusetts, Pennsylvania, Maryland, Vir-

ginia, exiles alien to the land, the language, and the times; in St. Domingo, penniless, sick, unwelcome refugees; and for just one century in Louisiana the jest of the proud Creole, held down by the triple fetter of illiteracy, poverty, and the competition of unpaid, half-clad, swarming slaves. But that now the slave was free, the school was free, and a new, wide, golden future waited only on their education in the greatest language of the world.

All this was pleasant enough to accept even in a dim way, though too good to be more than remotely grasped. But just when, as music in a sleeper's ear, it is taking hold of their impulses somewhat, comes the word of their hereditary dictator that this man is among them only for their destruction. What could they reply? They were a people around whom the entire world's thought had swirled and tumbled for four hundred years without once touching them. Their ancestors had left France before Descartes or Newton had begun to teach the modern world to think. They knew no method of reasoning save by precedent, and had never caught the faintest reflection from the mind of that great, sweet thinker who said, "A stubborn retention of customs is a turbulent thing, no less than the introduction of new." To such strangers in the world of to-day now came the contemptuous challenge of authority, defying them to prove that one who proposed to launch them forth upon a sea of changes out of sight of all precedent and tradition was not the hireling of some enemy's gold secretly paid to sap the foundations of all their spiritual and temporal interests and plunge them into chaos.

They blamed Bonaventure; he had got himself hated and them rebuked; it was enough. They said little to each other and nothing to him; but they felt the sleepy sense of injury we all know so well against one who was disturbing their slumber; and some began to suspect and distrust him, others to think hard of him for being suspected and distrusted. Yet all this reached not his ears, and the first betrayal of it was from the lips of Chatoué, when, in his cups, he unexpectedly invited the schoolmaster to leave Grande Pointe.

After that, even the unconscious schoolmaster could feel the faint chill of estrangement. But he laid it not to his work, but to his personal unloveliness, and said to 'Mian he did not doubt if he were more engaging there would not be so many maidens kept at the wheel and loom in the priceless hours of school, or so many strapping youths sent, all unlettered, to the sugar-kettles of the coast plantations what time M'sieu' Wallece big-in to gryne.

"'Tain't dat," said 'Mian. He had intended to tell the true reason, but his heart failed

him, and when Bonaventure asked what, then, it was, he replied:

"Aw, dey don't get no time. Time run so fas',—run like a scared dog. I dunno fo' w'at dey make dat time run so fas' dat way."

"O my friend," cried the young schoolmaster, leaping from his chair, "say not that! If God did not make time to p'ceed with rapidness, who would ever do his best?"

It was such lessons as this that made the children—Crébiche among them—still gather round the humble master and love to grasp his hand.

VII.

LOVE AND DUTY.

TIME ran fast. The seasons were as inexorable at Grande Pointe as elsewhere, but there was no fierceness in them. The very frosts were gentle. Slowly and kindly they stripped the green robes from many a tree, from many a thicket ejected like defaulting tenants the blue linnet, the orchard oriole, the nonpareil, took down all its leafy hangings and left it open to the winds and rain of December. The wet ponies and kine turned away from the north and stood in the slanting storm with bowed heads. The great wall of cypress swamp grew spectral. But its depths, the marshes far beyond sight behind them, and the little, hidden, rushy lakes, were alive with game. No snake crossed the path. Under the roof, on the galerie, the wheel hummed, the loom pounded; inside, the logs crackled and blazed on the hearth; on the board were venison, mallard, teal, rice-birds, *sirop de batterie*, and *quitte*; round the fireside were pipes, pecans, old stories, and the Saturday night contra-dance; and every now and then came sounding on the outer air the long, hoarse bellow of some Mississippi steamer, telling of the great world beyond the tree-tops, a little farther than the clouds and nearer than the stars.

Christmas passed, and New Year—time runs so fast! Presently yonder was 'Mian himself, spading a piece of ground to sow his tobacco seed in; then Catou and his little boy of twenty-five doing likewise; and then others all about the scattered village. Then there was a general spreading of dry brush over the spaded ground, then the sweet, clean smell of its burning, and, hanging everywhere throughout the clearing, its thin, blue smoke. The little frogs began to pipe to each other again in every wet place, the grass began to freshen, and almost in the calendar's mid-winter the smiles of spring were wreathing everywhere.

What of the schoolmaster and the children?

Much, much! The good work went on. Intense days for Bonaventure. The clouds of disfavor darkling in some places, but brightening in others and, on the whole, he hoped and believed, breaking. A few days of vacation, and then a bright reunion and resumption, the children all his faithful adherents save one—Sidonie. She, a close student, too, but growingly distant and reticent. The State Superintendent still believed to be—

“Impending, impending, chil’run! he is impending! Any day he may precipitate upon us!”

Intense days, too, for Claude. Sidonie openly, and oh, so sweetly, his friend. Loving him? He could neither say nor know; enough, for the present, to be allowed to love her. His love knew no spirit of conquest yet; it was star-worship; it was angel adoration; seraphically pure; something so celestially refined that had it been a tangible object you could have held it up and seen the stars right through it. The thought of acquisition would have seemed like coveting the gold of a temple. And yet already the faintest hint of loss was intolerable. Oh! this happy, happy school-going—this faring sumptuously on one smile a day! Ah, if it might but continue! But alas! how Sidonie was growing! Growing, growing, daily! up, up, up! While he—there was a tree in the swamp where he measured his stature every day; but in vain; in vain! It never budged! And then—all at once—like the rose-vine on her galerie, Sidonie burst into bloom.

Her smiles were kinder and more frequent now than ever before; but the boy’s heart was wrung. What chance now? In four long years to come he would not yet be quite nineteen, and she was fifteen now. Four years! He was in no hurry himself—could wait forever and be happy every day of it; but she? Such prize as she somebody would certainly bear away before three years could run by, run they ever so fast.

Sitting and pondering one evening in the little bayou cabin, Claude caught the father’s eye upon him, leaned his forehead upon the parent’s knee, and silently wept. The rough father said a kind word, and the boy, without lifting his burning face, told his love. The father made no reply for a long time, and then he said in their quaint old French:

“Claude, tell the young schoolmaster. Of all men, he is the one to help you.” And then in English, as you would quote Latin, “Knowledge is power!”

The next day he missed—failed miserably—in every lesson. At its close he sat at his desk, crushed. Bonaventure seemed scarce less tempest-tossed than he; and all about

the school the distress spread as wintry gray overcasts a sky. Only Sidonie moved calmly her accustomed round like some fair, silent, wide-winged bird circling about a wreck.

At length the lad and his teacher were left alone. Claude sat very still, looking at his toil-worn hands lying crossed on the desk. Presently there sank an arm across his shoulders. It was the master’s. Drop—drop—two big tears fell upon the rude desk’s sleeve-polished wood. The small, hard, right hand slowly left its fellow and rubbed off the wet spots.

“Claude, you have something to disclose me?”

The drooping head nodded.

“And ’tis not something done wrongly?”

The lad shook his head.

“Then, my poor Claude,”—the teacher’s own voice faltered for a moment,—“then—’tis—’tis she!” He stroked the weeping head that sank into its hands. “Ah! yes, Claude, yes; ’tis she; ’tis she! And you want me to help you. Alas! in vain you want me! I cannot even try-y-y to help you; you have mentioned it too lately! ’Tis right you come to me, despitng discrepancy of years; but alas! the difficulty lies in the contrary; for alas! Claude, our two heart’ are of the one, same age!”

They went out; and walking side by side toward the failing sun, with the humble flowers of the field and path newly opened and craving leave to live about their feet and knees, Bonaventure Deschamps revealed his own childlike heart to the simple boy whose hand clasped his.

“Yes, yes; I conceal not from you, Claude, that ’tis not alone ‘thou lovest,’ but ‘I love’! If with cause to hope, Claude, I know not. And I must not search to know whilst yet the schoolmaster. And the same to you, Claude, whilst yet a scholah. We mus’ let the dissimulation like a worm in the bud to h-eat our cheek. ’Tis the voice of honor cry—‘Silence.’ And during the meanwhilst, you? Perchance at the last, the years passing and you enlarging in size daily and arriving to budding manhood, may be the successful; for suspect not I consider lightly the youngness of yo’ passion. Attend what I shall reveal you. Claude, there once was a boy, yo’ size, yo’ age, but fierce, selfish, distemperate; still more selfish than yo’ schoolmaster of to-day.” And there that master went on to tell of an early,—like Claude’s, an all too early,—rash, and boyish passion, whose ragged wound, that he had thought never could heal, was now only a tender scar.

“And you, too, Claude, though now it seem not possible—you shall recuperate from this. But why say I this? Think you I would inoculate the idea that you must despair?

Nay, perchance you shall achieve her." They stood near the lad's pirogue about to say adieu; the schoolmaster waved his hand backward toward the farther end of the village. "She is there; in a short time she will cease to continue scholah; then — try." And again, with still more courageous kindness, he repeated, "Try! 'Tis a lesson that thou shouldest heed — try, try again. If *at* the first thou doest *not* succeed, try, try again."

Claude gazed gratefully into the master's face. Boy that he was, he did not read aright the anguish gathering there. From his own face the clouds melted into a glad sunshine of courage, resolve, and anticipation. Bonaventure saw the spark of hope that he had dropped into the boy's heart blaze up into his face. And what did Claude see? The hot blood mounting to the master's brow an instant ere he wheeled and hurried away.

"'Sieur Bonaventure!' exclaimed Claude; "'Sieur Bonaventure!'"

But deaf to all tones alike, Bonaventure moved straight away along the bushy path and was presently gone from sight. There is a repentance of good deeds. Bonaventure Deschamps felt it gnawing and tearing hard and harder within his bosom as he strode on through the wild vernal growth that closed in the view on every side. Soon he halted; then turned, and began to retrace his steps.

"Claude!" The tone was angry and imperative. No answer came. He quickened his gait. "Claude!" The voice was petulant and imperious. A turn of the path brought again to view the spot where the two had so lately parted. No one was there. He moaned and then cried aloud, "O thou fool, fool, fool! — Claude!" He ran; faster — faster — down the path, away from all paths, down the little bayou's margin, into the bushes, into the mud and water. "Claude! Claude! I told you wrongly! Stop! *Arretez-la!* I must add somewhat! — Claude!" The bushes snatched away his hat; tore his garments; bled him in hands and face; yet on he went into the edge of the forest. "Claude! Ah! Claude, thou hast ruin' me! Stop, you young rascal! — thief! — robber! — brigand!" A vine caught and held him fast. "Claude! Claude!" — The echoes multiplied the sound and scared from their dead-tree roost a flock of vultures. The dense wood was wrapping the little bayou in its premature twilight. The retreating sun, that for a while had shot its flaming arrows through the black boles and branches, had sunk now and was gone. Only a parting ruby glow shone through the tangle where far and wide the echoes were calling for Claude.

"Claude! I mistook the facts in the case.

There is no hope for you! 'Tis futile you try — the poem is not for you! I take everything back! — all back! You shall not once try! You have grasp' the advantage! You got no business, you little rascal! *You* dare venture to attempt making love in my school! Claude St. Pierre, you are dismiss' the school! Mutiny! mutiny! Claude St. Pierre, for mutinizing, excluded the Gran' Point' school."

He tore himself from his fastenings and hastened back toward the village. The tempest within him was as fierce as ever, but already it, too, had turned and was coming out of the opposite quarter. The better Bonaventure — the Bonaventure purified by fires that Grande Pointe had no knowledge of — was coming back into his gentle self-mastery. And because that other, that old time, Bonaventure, bound in chains deep down within, felt already the triumph of a moment slipping from his grasp, he silently now to the outer air, but loudly within, railed and gnashed and tore himself the more.

He regained the path and hurried along it, hatless, disheveled, bespattered, and oblivious to everything save the war within. Presently there came upon him the knowledge, the certain knowledge, that Claude would come the next morning and ring the chapel bell, take his seat in school, stand in all his classes, know every lesson, and go home in the evening happy and all unchallenged of him. He groaned aloud.

"Ah! Claude! To dismiss or not to dismiss, it shall not be mine! But it shall be thine, Sidonie! And whether she is for thee, Claude — so juvenile! — or for me, so unfit, unfit, unfit! — Ah! Sidonie, choose not yet! — He stood rooted to the spot; while within easy earshot of his lightest word tripped brightly and swiftly across the path from the direction of the chapel a fawn, Claude's gift, and its mistress, Sidonie — as though she neither saw nor heard.

VIII.

AT CLAUDE'S MERCY.

TIME flagged not. The school shone on, within its walls making glad the teacher and the pupils with ever new achievements in knowledge and excellence, some of the vanguard — Claude, Sidonie, Etienne, Madelaine, Henri, Marcelline — actually going into the Third Reader. Such perfection in lessons as they told about at home — such mastery of English, such satisfactory results in pronunciation and emphasis! Reading just as they talked? Oh no, a thousand times no! The school's remoter light, its secondary influences, slowly spreading, but so slowly that only the

eyes of enmity could see its increase. There were murmurs and head-shakings; but the thirteenth Sunday of the year's first quarter came, and the sermon whose withholding had been threatened was preached. And on the thirteenth Monday there was Bonaventure, still moving quietly across the green toward the school-house with the children all about him. But a few days later the unexpected happened.

By this time Claude's father, whose teacher, you remember, was Claude, had learned to read. One day a surveyor, who had employed him as a guide, seeing the Acadian laboring over a fraction of rural newspaper, fell into conversation with him as they sat smoking by their camp-fire, and presently caught some hint of St. Pierre's aspirations for himself and his son.

"So there's a public school at Grande Pointe, is there?"

"Oh, yass; fine school'ouse, hondred feet long! and fine titcher; splendid titcher; titch English."

"Well, well!" laughed the surveyor. "Well, the next thing will be a railroad."

St. Pierre's eyes lighted up.

"You t'ink!"

"Why, yes; you can't keep railroads away from a place long, once you let in the public school and teach English."

"You t'ink dass good?"

"What, a railroad? Most certainly. It brings immigration."

"Whass dat — 'migrash'n?"

The surveyor explained.

The next time St. Pierre came to Grande Pointe—to sell some fish—he came armed with two great words for the final overthrow of all opponents of enlightenment: "Rellroad — 'migrash'n."

They had a profound and immediate effect—exactly the opposite of what he had expected.

The school had just been dismissed; the children were still in sight, dispersing this way and that. Sidonie lingered a moment at the desk, putting it in order; Claude, taking all the time he could, was getting his canoe-paddle from a corner; Crébiche was waiting, by the master's command, to repair some default of the day; and Toutou, outside on his knees in the grass catching grasshoppers, was tarrying for his sister, when four or five of the village's best men came slowly and hesitatingly in. It required no power of divination for even the preoccupied schoolmaster to guess the nature of their errand. 'Mian was not among them. Catou was at their head. They silently bowed. The schoolmaster as silently responded. The visitors huddled together. They came a step nearer.

"Well," said Catou, "we come to see you."

"Sirs, welcome to Gran' Point' school — Sidonie, Crébiche, Claude, rest in yo' seats."

"Mo' betteh you tu'n 'em loose, I t'ink," said Catou amiably; "ain't it?"

"I rather they stay," replied Bonaventure. All sat down. There was a sustained silence, and then Catou said with quiet abruptness:

"We dawn't want no mo' school!"

"From what cause?"

"'Tain't no use."

"Sir — sirs, no use? 'Tis every use! The school-house? 'tis mo' worth than the gole mine. Ah! sirs, tell me: what is gole without education?"

They confronted the riddle for a moment.

"Ed'cation want to change everythin' — relldoad — 'migrash'n."

"Change everything? Yes!—making everything better! Sirs, where is that country that the people are sorry that the railroad and the school-house have come?" Again the riddle went unanswered; but Catou sat as if in meditation, looking to one side, and presently said:

"I t'ink dass all humbug, dat titchin' English. What want titch English faw?"

"Sir," cried Bonaventure, "in America you mus' be American! Three Acadians have been governors of Louisiana! What made them thus to become?" He leaned forward and smote his hands together. "What was it? 'Twas English education!"

The men were silent again. Catou pushed his feet out, and looked at his shoes, put on for the occasion. Presently —

"Yaas," he said, in an unconvinced tone; "yass, dass all right; but how we know you titch him right? Nobody can't tell you titchin' him right or no."

"And yet — I do! And the time approach when you shall know! Sirs, I make to you a p'oposition. Time is passing. It must be soon the State Sup'inten'ent Public Education visit this school. The school is any time ready. Since long time are we waiting. He shall come—he shall examine! The chil'run shall be ignorant this arrangement! Only these shall know — Claude, Sidonie, Crébiche; they will not disclose! And the total chil'run shall exhibit all their previous learning! And welcome the day, when the *adversaries* of education shall see those dear chil'run stan' up befo' the assem'led Gran' Point' spelling co'ectly words of one to eight syllable' and *reading from their readers*! And if one miss—if *one* — *one*! miss, then let the school be shut and the schoolmaster banish-ed!"

It was so agreed. The debate did not cease at once, but it languished. Catou thought he had one strong point when he objected to

education as conducive to idle habits; but when the schoolmaster hurled back the fact that communities the world over are industrious just in proportion as they are educated, he was done. He did not know, but when he confronted the assertion it looked so true that he could not doubt it. He only said:

"Well, anyhow, I t'ink 'tain't no use Crébiche go school no mo'." But when Bonaventure pleaded for the lad's continuance, that too was agreed upon. The men departed.

"Crébiche," said the master, holding the boy's hand at parting, "ah! Crébiche, if thou become not a good scholar"—and read a promise in the boy's swimming eye.

"Claude, Claude, I am at yo' mercy now." But the honest gaze of Claude and the pressure of his small, strong hand were a pledge. The grateful master turned to Sidonie, and again, as of old, no Sidonie was there.

IX.

READY.

SUMMER came. The song-birds were all back again, waking at dawn, and making the hoary cypress wood merry with their carolings to the wives and younglings in the nests. Busy times. Foraging on the helpless enemy—earthworm, gnat, grub, grasshopper, weevil, sawyer, dragon-fly—from morning till night: watching for him; scratching for him; picking, pecking, boring for him; poisoning, swooping, darting for him; standing upside down and peering into chinks for him; and all for the luxury—not of knowledge, but of love and marriage. The mocking-bird had no rest whatever. Back and forth from dawn to dark, back and forth across and across Grande Pointe clearing, always one way empty and the other way with his beak full of marketing; and then sitting up on an average half the night—sometimes the whole of it—at his own concert. And with military duties too; patrolling the earth below, a large part of it, and all the upper air; driving off the weasel, the black snake, the hawk, the jay, the buzzard, the crow, and all that brigand crew—busy times! All nature in glad, gay earnest. Corn in blossom and rustling in the warm breeze; blackberries ripe; morning-glories underfoot; the trumpet-flower flaring from its dense green vine high above on the naked, girdled tree; the cotton-plant blooming white, yellow, and red in the field beneath; honey a-making in the hives and hollow trees; butterflies and bees lingering in the fields at sunset; the moth venturing forth at the first sign of dew; and Sidonie—a wild-rose-tree.

Mark you, this was in Grande Pointe. I

VOL. XXXIII.—86.

have seen the wild flower taken from its cool haunt in the forest and planted in the glare of a city garden. Alas! the plight of it, poor outshone, wilting, odorless thing! And then I have seen it again in the forest; and pleasanter than to fill the lap with roses and tulips of the conservatory's blood-royal it was to find it there, once more the simple queen of that green solitude.

So Sidonie. Acadian maidens are shy as herons. They always see you first, silently rise, and are gone—from the galerie. They are more shy than violets. You would think they lived whole days with those dark, black-fringed eyes cast down; but—they see you first. The work about the house is well done where they are; there are apt to be flowers outside round about; while they themselves are as Paul desired to see the women in Bishop Timothy's church, "adorned in modest apparel, with shamefacedness and sobriety."

Flowers sprang plentifully where Sidonie dwelt. Her best homespun gown was her own weaving; the old dog lying on the galerie always thumped the floor with his tail and sank his obsequious head as that robe passed; the fawn—that Claude had brought—would come trotting and press his head against it; all the small living things of the dooryard would follow it about; and if she stood by the calf-pen the calves would push each other for the nearest place, lay their cheeks upon the fence's top, and roll their eyes—as many a youth of Grande Pointe would have done if he might. Chatoué,—I fear I have omitted to mention that the father of Crébiche, like the father of Claude, had lost his wife before he was of age,—Chatoué looked often over that fence.

When matters take that shape a girl *must* quit school. And yet Sidonie, when after a short vacation the school resumed its sessions, resumed with it. Toutou, who had to admit now that his sister was even more grand for her age than he, was always available for protection. There was no wonder that Sidonie wished to continue; Bonaventure explained why:

"So interesting is that McGuffey's Third Reader!"

Those at home hesitated, and presently it was the first of October. Now it was too late to withdraw; the examination was to take place. The school's opponents had expressed little impatience at the State Superintendent's weary delay, but at length Catou asked, "Why dat man don't nevva come?"

"The wherefore of his non-coming I ignore," said Bonaventure, with a look of old pain in his young face; "but I am ready, let him come or let him come not."

"'Tain't no use wait no longer," said Catou; "jis well have yo' lil show widout him."

"Sir, it shall be had! Revolution never go backwood!"

Much was the toil, many the anxieties of the preparation. For Bonaventure at once determined to make the affair more than an examination. He set its date on the anniversary of the day when he had come to Grande Pointe. From such a day Sidonie could not be spared. She was to say a piece, a poem, an apostrophe to a star. A child, beholding the little star in the heavens, and wondering what it can be, sparkling diamond-like so high up above the world, exhorts it not to stop twinkling on his account. But to its tender regret the school knew that no more thereafter was Sidonie to twinkle in its firmament.

"Learn yo' lessons hard, chil'run; if the State Sup'inten'ent, even at the last, you know"—Bonaventure could not believe that this important outpost had been forgotten.

X.

CONSPIRACY.

ABOUT this time a certain Mr. Tarbox—G. W. Tarbox—was traveling on horseback and touching from house to house of the great sugar estates of the river "coast," seeing the country and people and allowing the élite to subscribe to the "Album of Universal Information."

One Sunday, resting at College Point, he was led by curiosity to cultivate the acquaintance of three men who had come in from Grande Pointe. One of them was Chatoué. He could understand them, and make them understand him, well enough to play *vingt et un* with them the whole forenoon. He won all their money, drank with them, and took their five subscriptions, Chatoué taking three—one for himself, one for Catou, and one for Crébiche. There was no delivery of goods there and then; they could not write; but they made their marks, and it was agreed that when Mr. Tarbox should come along a few days later to deliver the volumes, they were not to be received or paid for until with his scholarly aid the impostor who pretended to teach English education at Grande Pointe had been put to confusion and to flight.

"All right," said Tarbox; "all *right*. I'm the kind of State Superintendent you want. I like an adventure; and if there's anything I just love, it's exposing a fraud! What day shall I come? Yes, I understand—middle of the day. I'll be on hand."

The fateful day came. In every house and on every galerie the morning tasks were early done. Then the best of every wardrobe was put on, the sun soared high, and by noon every

chair in Grande Pointe was in the tobacco-shed where knowledge poured forth her beams, and was occupied by one or two persons. And then, at last, the chapel bell above Claude's head pealed out the final signal, and the school-master moved across the green. Bonaventure Deschamps was weary. Had aught gone wrong? Far from it. But the work had been great and it was now done. Everything was at stake: the cause of enlightenment and the fortunes of his heart hung on the issue of the next few hours. Three pupils, one the oftenest rebuked of all the school, one his rival in love, one the queen of his heart, held his fate in their hands and knew it. With these thoughts mingled the pangs of an unconfessed passion and the loneliness of a benevolent nature famishing for a word of thanks. Yes, and to-day he must be his own judge.

His coat was on his arm, and the children round about him in their usual way as they came across the common; but his words, always so kind, were, on this day of all days, so dejected and so few that the little ones stole glances into his face and grew silent. Then, all at once, he saw,—yea, verily, he *saw*,—standing near the school entrance, a man from the great outer world!

He knew it by a hundred signs—the free attitude, the brilliant silk hat, the shaven face, and every inch of the attire. As plainly as one knows a green tree from a dead one, the Crusoe of Grande Pointe recognized one who came from the haunts of men; from some great nerve-center of human knowledge and power where the human mind, trained and equipped, had piled up the spoils of its innumerable conquests. His whole form lighted up with a new life. His voice trembled with pent feeling as he said in deep undertone:

"Be callm, chil'run; be callm. Refrain excitement. Who you behole befo' you, yondeh, I ignore. But who shall we expect to see if not the State Sup'inten'ent Public Education? And if yea, then welcome, thrice welcome, the surprise! We shall not inquire him; but as a stranger we shall show him with how small reso'ce how large result." He put on his coat.

Mr. Tarbox had just reached the school-ground. His horse was fastened by the bridle to a picket in a fence behind him. A few boys had been out before the school-house, and it was the sudden cessation of their clamor that had drawn Bonaventure's attention. Some of them were still visible, silently slipping through the gaps in the *pieux* and disappearing within. Bonaventure across the distance marked him beckon persuasively to one of them. The lad stopped, came forward, and gave his hand; and thereupon a second, a third, fourth, fifth, tenth, without waiting

for invitation, emerged again and advanced to the same grave and silent ceremony. Two or three men who stood near did the same. The handshaking was just ending when Bonaventure and the stranger raised their hats to each other.

"Trust I don't intrude?"

"Sir, we are honored, not intruded, as you shall witness. Will you give yourself the pain to enter the school-place? I say not school-house; 'tis, as its humble teacher, not fitly so nominated. But you shall therein find a school which, the more taken by surprise, not the less prepared."

"The State ought to build you a good school-house," said the stranger, with a slight frown that seemed official.

"Ah! sir," cried the young schoolmaster, beaming gratitude from his whole surface, "I—I,"—he smote his breast,— "I would re-imburs't her in good citizen' and mother' of good citizen'! And both reading, writing, and also ciphering,—arithmeticalating, in the English tongue, and grammatically! But enter and investigate."

A hush fell upon the school and the audience beyond it as the two men entered. Every scholar was in place—the little ones with bare, dangling feet, their shapely suntanned ankles just peeping from pantaloons and pantalettes; the older lads beyond them; and off at the left the larger girls, and Sidonie. The visitor, as his eye fell last upon her, silently and all to himself drew a long whistle. The master stood and eyed him with unspoken but confessed pride. A little maiden of six slipped from the bench to the earth floor, came forward, gave her hand, and noiselessly returned. One by one, with eyes dropped, the remaining sixteen girls followed. It seemed for a moment as if the contagion might break out in the audience, but the symptom passed.

There was just room on the teacher's little platform for Bonaventure to seat his visitor a little at one side and stand behind his desk. The fateful moment had come. The master stood nervously drawn up, bell in hand. With a quick, short motion he gave it one tap, and set it down.

"That, sir, is to designate attention!" He waved a triumphant hand toward the spectacle before them.

"Perfect!" murmured the stranger. A look of earnest ecstasy broke out upon the master's face. He turned at first upon the audience and then upon the school.

"Chil'run, *chil'run*, he pronounce you perfect!" He turned again upon the visitor, threw high his right hand, flitted it violently, and cried:

"At random! exclusively at random; state what class! at random!"

"I—I doubt if I under—"

"Name any class, exclusively at random, and you shall see with what promptness and quietude the chil'run shall take each one their exactly co'ect places!"

"Oh, I understand. You want me to designate—"

"Any class! at yo' caprice."

"Well, if you have third class in geography."

"Or spelling?" cried Bonaventure, a momentary look of dismay giving place to fresh enthusiasm.

"Yes—spell—I meant spelling."

"Third spelling!" The tongue of the bell fell with the emphasis, and as silently as sleep the tiniest seven in the school, four pairs of pantaloons, three of pantalettes, with seven of little bare feet at their borders and seven of hands pointed down stiffly at their sides, came out and stood a-row. The master turned to the visitor.

"Now, commencing wherever, even at the foot if desired! ask, sir, if you please, any English word of one syllable, of however difficult!"

"No matter how difficult?"

"Well, they are timid, as you see; advance by degrees."

"Very well, then," said the visitor with much kindness of tone; "I will ask the little boy at this end."

"At the foot—but—still, 'tis well. Only—Ah, Crébiche! everything depend! Be prepared, Crébiche!"

"Yes," said the stranger; "I will ask him to spell hoss."

The child drew himself up rigidly, pointed his stiffened fingers down his thighs, rounded his pretty, red mouth, and said slowly, in a low, melodious, distinct voice:

"'O-double eth, awth."

Bonaventure leapt from the platform and ran to the child.

"*Ah! mon p'tit garçon*—ah! my lil boy! 'O-double eth, listen, my chile. O, sir, he did not hear the word precisely. Listen, my chile, to yo' teacher! remember that his honor and the school's honor is in yo' spelling!" He drew back a step, poised himself, and gave the word. It came like an anchor-chain crashing through a hawse-hole.

"Or-r-r-rus-seh!" And the child, winking at vacancy in the intensity of his attention spelled:

"Haich-o-r-eth-e, 'Orthe."

The breathless audience, leaning forward, read the visitor's commendation in his face. Bonaventure, beaming upon him, extended one arm, the other turned toward the child, and cried, shaking both hands tremulously:

"Another! another word! another to the same!"

"Mouse," said the stranger, and Bonaventure turned and cried:

"Mah-ooseh! mynob'elilboy! Mah-ooseh!" and Crébiche, a speaking statue, spelled:

"M-o-u-eth-e, mouthe."

"Co-ect, my chile! And yet, sir, and yet 'tis he that they call Crébiche, because like the crawfish advancing backwardly. But to the next! another word! another word!"

The spelling, its excitements, its moments of agonizing suspense, and its triumphs, went on. The second class is up. It spells in two, even in three, syllables. Toutou is in it. He gets tremendously wrought up; cannot keep two feet on the ground at once; spells fast when the word is his; smiles in response to the visitor's smile, the only one who dares; leans out and looks down the line with a knuckle in his mouth as the spelling passes down; wrings one hand as his turn approaches again; catches his word in mid-air and tosses it off, and marks with ecstasy the triumph and pride written on the face of his master.

"But, sir," cries Bonaventure, "why consume the spelling-book? Give, yourself, if you please, to Toutou, a word not therein comprise'." He glanced around condescendingly upon the people of Grande Pointe. Chatoué is in a front seat. Toutou gathers himself for the spring, and the stranger ponders a moment and then gives—"Florida!"

"F-l-o, flo, warr-de-warr-da,—Florida!"

A smile broke from the visitor's face unbidden, but—

"Right! my chile! co-ect, Toutou!" cried Bonaventure, running and patting the little hero on the back and head by turns. "Sir, let us"—He stopped short. The eyes of the house were on Chatoué. He had risen to his feet and made a gesture for the visitor's attention. As the stranger looked at him he asked:

"He spell dat las word r-i-i-ight?" But the visitor with quiet gravity said, "Yes, that was all right"; and a companion pulled the Raccoon down into his seat again. Bonaventure resumed.

"Sir, let us not exhoss the time with spelling! You shall now hear them read."

The bell taps, the class retires; again, and the reading class is up. They are the larger girls and boys. But before they begin the master has a word for their fathers and mothers.

"Friends and fellow-citizens of Gran' Point', think not at the suppi-zing goodness of yo' chil'run' reading. 'Tis to this branch has been given the largest attention and most assidu'ty, so thus to comprise puffedion in the English tongue, whether speaking aw otherwise." He turned to the stranger beside him. "I am not

satisfied whilst the slightest accent of French is remaining. But you shall judge if they read not as if in their own vernaculary. And you shall choose the piece!"

The visitor waived the privilege, but Bonaventure gently insisted, and he selected Jane Taylor's little poem, "The Violet," glancing across at Sidonie as he himself read out the first two lines:

"Down in a green and shady bed,
A modest violet grew."

Bonaventure proclaimed the title and page and said:

"Claude, proceed!" And Claude read:

"'Dthee vy—ee-lit. Dah-oon-a hin hay grin and-a shad-y bade—A mo-dest-a vy-ee-lit grōo—Hits-a stallo whoz baint hit hawngg-a hits hade—Has hif-a too hah-ed-a frawm ve-ōo. Hand h-yet it whoz a lo-vly flow'r—Hits-a co-lors-a brah-eet and fair-a—Heet maheet-a hāve grass-ed a rozzy bow'r—Heenstade-a hof hah-ee-dingg there—"

"Stop!" cried Bonaventure; "stop! You pronounce' a word faultily!" He turned to the visitor. "I call not that a miss; but we must inoculate the idea of puffedion. So soon the sly-y-test misp'onounciating I pass to the next." He turned again: "Next!" And a black-haired girl began in a higher key, and very slowly:

"Yate there eet whoz cawntaint-a too bulloom—Heen mo-dest-a teent z-arry-ed—And there-a heet sprade-a heets swit pre-fume-a—Whit-hin thee sy-y-lent-a shade—"

"Stop! Not that you mistook, but—'tis enough. Sir, will you give yourself the pain to tell—not for my sake or reputation, but to the encouragement of the chil'run, and devoid flattery—what is yo' opinion of that specimen of reading? Not t'oubling you, but, in two or three word' only—if you will give yo'self the pain—"

"Why, certainly; I think it is—I can hardly find words—it's remarkable." Bonaventure started with joy.

"Chil'run, do you hear? Remawkable! But do you not detect no slight—no small faultiness of p'onounciating?"

"No, not the slightest—I smile, but I was thinking of something else." His eye, wandering a trifle, caught Chatoué giving him one black look that removed his disposition to smile, yet he insisted, "No, sir; I can truthfully say I never heard such a pronunciation." The audience drank his words.

"Sir," cried the glad preceptor, "'tis toil have p'oduce it! Toil of the teacher, industry of the chil'run! But it has p'oduce' beside! Sir, look—that school! Since one year com-

mencing the A B C — and now spelling word' of eight syllabl'!"

"Not *this* school — ?"

"Sir, you shall see — or, more p'operly, hear. First spelling!"

"Yes," said the stranger, seeing Sidonie rise, "I'd like to hear that class"; and felt Chatoué looking at him again.

X.

LIGHT, LOVE, AND VICTORY.

THE bell tapped, and they came forth to battle. There was the line, there was the leader. The great juncture of the day was on him. Was not here the State's official eye? Did not victory hover overhead? His reserve, the darling regiment, the flower of his army, was dressing for the final charge. There was Claude. Next him, Sidonie! — and Etienne and Madelaine, Henri and Marcelline, — all waiting for the word — the words — of eight syllables! Supreme moment! Would any betray? Banish the thought! Would any fail?"

He waited an instant while two or three mothers bore out great armfuls of slumbering or fretting infancy and a number of young men sank down into the vacated chairs. Then he stepped down from the platform, drew back four or five yards from the class, opened the spelling-book, scanned the first word, closed the book with his finger at the place, lifted it high above his head, and cried:

"Claude! Claude, my brave scholar, always perfect, ah you ready?" He gave the little book a half whirl round and dashed forward toward the chosen scholar, crying as he came:

"In-e-rad-i-ca-bility!"

Claude's face suddenly set in a stony vacancy, and with his eyes staring straight before him he responded:

"I-n, in-, e, inerad-, r-a-d, rad-, inerad-, ineraddy-, ineradica-, c-a, ca, ineradica-, in-eradicabili-, b-i-el-ly-billy, ineradicabili-, in-eradicabili-, t-y, ty, ineradicability."

"Right! Claude, my boy! my always good scholar, right!" The master drew back to his starting-place as he spoke, reopened the book, shut it again, lifted it high in air, cried, "Madelaine, my dear chile, prepare!" whirled the book and rushed upon her with —

"In-de-fat-i-ga-bil-ly-ty!"

Madelaine turned to stone and began:

"I-n, een, d-e, de-, inde-, indefat-, indefat — fat — f-a-t, fat, indefat, indefatty, i, ty, in-defati- indefatiga-, g-a, ga, indefatiga-, indefat-igabilly, b-i-el-ly, billy, indefatigabili't-y, ty, indefatigability."

"O, Madelaine, my chile, you make yo' teacher proud! prah-ood, my chile!" Bona-

venture's hand rested a moment tenderly on her head as he looked first toward the audience and then toward the stranger. Then he drew off for the third word. He looked at it twice before he called it. Then —

"Sidonie! ah! Sidonie, be ready! be prepared! fail not yo' humble school-teacher! In-com —" He looked at the word a third time, and then swept down upon her:

"In-com-pre-hen-si-ca-bility!"

Sidonie flinched not nor looked upon him, as he hung over her with the spelling-book at arm's-reach above them; yet the pause that followed seemed to speak dismay, and throughout the class there was a silent recoil from something undiscovered by the master. But an instant later Sidonie had chosen between the two horns of her agonizing dilemma, and began:

"I-n, een, c-o-m, cawm, eencawm, eencawmpre, p-r-e, pre, eencawmpre, eencawmprehen, prehen, haich-e-n, hen, hen, eencawmprehensi, s-i, si, eencawmprehensi-, b-i-l, bil —"

"Ah! Sidonie! Stop! *Arrêtez!* Si-do-nie-e-e-e! Oh! listen — *écoutez* — Sidonie, my dear!" The master threw his arms up and down in distraction, then suddenly faced his visitor, "Sir, it was my blame! I spoke the word without adequate distinction! Sidonie — *maintenant* — now!" But a voice in the audience interrupted with —

"*Assoiez-vous la*, Chatoué! Seet down, yondeh!" And at the potent voice of Maximian Roussel the offender was pushed silently into the seat he had risen from, and Bonaventure gave the word again.

"In-com-pre-hen-si-ca-bil-i-ty!" And Sidonie, blushing like fire, returned to the task:

"I-n, een —" She bit her lip and trembled.

"Right! *Right!* Tremble not, my Sidonie! fear naught! yo' loving schoolteacher is at thy side!" But she trembled like a red leaf as she spelled on — "Haich-e-n, hen, eencawnprehen, eencawmprehensi, s-i, si, eencawmprehensi-, eencawmprehensi-billy-t-y, ty, incomprehensibility!"

The master dropped his hands and lifted his eyes in speechless despair. As they fell again upon Sidonie, her own met them. She moaned, covered her face in her hands, burst into tears, ran to her desk and threw her hands and face upon it, shaking with noiseless sobs and burning red to the nape of her perfect neck. All Grande Pointe rose to its feet.

"Lost!" cried Bonaventure, in a heart-broken voice. "Everything lost! Farewell, chil'run!" He opened his arms toward them and with one dash all the lesser ones filled them. They wept. Tears welled from Bonaventure's eyes; and the mothers of Grande

Pointe dropped again into their seats and silently added theirs.

The next moment all eyes were on Maximian. His strong figure was mounted on a chair, and he was making a gentle, commanding gesture with one hand as he called:

"Seet down! Seet down, all han'!" And all sank down, Bonaventure in a mass of weeping and clinging children. 'Mian too resumed his seat, at the same time waving to the stranger to speak.

"My friends," said the visitor, rising with alacrity, "I say when a man makes a bargain, he ought to stick to it!" He paused for them—as many as could—to take in the meaning of his English speech, and, it may be, expecting some demonstration of approval; but dead silence reigned, all eyes on him save Bonaventure's and Sidonie's. He began again.

"A bargain's a bargain!" And Chatoué nodded approvingly and began to say, audibly, "Yass"; but 'Mian thundered out:

"*Taise toi*, Chatoué! Shot op!" And the silence was again complete, while the stranger resumed.

"There was a plain bargain made." He moved a step forward and laid the matter off on the palm of his hand. "There was to be an examination; the school was not to know; but if one scholar should make one mistake the school-house was to be closed and the schoolmaster sent away. Well, there's been a mistake made, and I say a bargain's a bargain." Dead silence still. The speaker looked at 'Mian. "Do you think they understand me?"

"Dey meck out," said 'Mian, and shut his firm jaws.

"My friends," said the stranger once more, "some people think education's a big thing, and some think it ain't. Well, sometimes it is and sometimes it ain't. Now, here's this man"—he pointed down to where Bonaventure's disheveled crown was drooping to his knees—"claims to have taught over thirty of your children to read. Well, what of it? A man can know how to read and be just as no account as he was before. He brags that he's taught them to talk English. Well, what does that prove? A man *might* speak English and starve to death. He claims, I am told, to have taught some of them to write. But I know a man in the penitentiary that can write; he wrote too much."

Bonaventure had lifted his head and was sitting with his eyes upon the speaker in close attention. At this last word he said:

"Ah! sir! too true, too true ah yo' words; nevertheless, their cooelty! 'Tis not what is print' *in* the books, but what you learn *through* the books!"

"Yes; and so you hadn't never ought to have made the bargain you made; but, my friends, a bargain's a bargain, and the teacher's—" He paused invitingly, and an answer came from the audience. It was Catou who rose and said:

"Naw, sah. Naw; he don't got to go!" But again 'Mian thundered:

"*Taise toi*, Catou. Shot op!"

"I say," continued the stranger, "the mistake's been made. *Three* mistakes have been made!"

"Yass!" roared Chatoué, leaping to his feet and turning upon the assemblage a face fierce with triumph. Suspense and suspicions were past now; he was to see his desire on his enemy. But instantly a dozen men were on their feet—St. Pierre, Catou, Bonaventure himself, with a countenance full of pleading deprecation, and even Claude, flushed with anger.

"Naw, sah! Naw, sah! Waun meesteck!"

"Seet down, all han'!" yelled 'Mian; "all han' seet dah-oon!" Only Chatoué took his seat, glancing upon the rest with the exultant look of one who can afford to yield ground.

"The first mistake," resumed the stranger, addressing himself especially to the risen men still standing, and pointedly to Catou, "the first mistake was in the kind of bargain you made." He ceased, and passed his eyes around from one to another until they rested an instant on the bewildered countenance of Chatoué. Then he turned again upon the people, who had sat down, and began to speak with the exultation of a man that feels his subject lifting him above himself.

"I came out here to show up that man as a fraud. But what do I find? A poor, unpaid, half-starved man that loves his thankless work better than his life, teaching what not one schoolmaster in a thousand can teach; teaching his whole school four better things than were ever printed in any school-book—how to study, how to think, how to value knowledge, and to love one another and mankind. What you'd ought to have done was to agree that such a school should keep open, and such a teacher should stay, if jest one, one lone child should answer one single book-question right! But as I said before, a bargain's a bargain—Hold on there! Sit down! You sha'n't interrupt me again!" Men were standing up on every side. There was confusion and a loud buzz of voices. "The second mistake," the stranger made haste to cry, "was thinking the teacher gave out that last word right. He gave it wrong! And the third mistake," he shouted against the rising commotion, "was thinking it was spelt wrong. *She spelt it right!* And a bargain's a bargain! The schoolmaster stays!"

He could say no more; the rumble of voices suddenly burst into a cheer. The women and children laughed and clapped their hands,—Toutou his feet also,—and Bonaventure, flirting the leaves of a spelling-book till he found the place, looked, cried—"In-com-pre-hen-sibility!" wheeled and dashed upon Sidonie, seized her hands in his as she turned to fly, and gazed speechlessly upon her, with the tears running down his face. Feeling a large hand upon his shoulder, he glanced around and saw 'Mian pointing him to his platform and desk. Thither he went. The stranger had partly restored order. Every one was in his place. But what a change! What a gay flutter throughout the old shed. Bonaventure seemed to have bathed in the fountain of youth. Sidonie, once more the school's queen-flower, sat calm, with just a trace of tears adding a subtle something to her beauty.

"Chil'run, beloved chil'run," said Bonaventure, standing once more by his desk, "yo' schoolteacher has the blame of the sole mistake; and, sir, gladly, oh, gladly, sir, would he always have the blame rather than any of his beloved school-chil'run! Sir, I will boldly ask you—*ah* you not the State Sup'inten'ent Public Education?"

"No, I—"

"But surely, sir, than a greater?—Yes, I discover it, though you smile. Chil'run—friends—not the State Sup'inten'ent, but greater!—Pardon; have yo' chair, sir."

"Why, the examination's over, isn't it? Guess you'd better call it finished, hadn't you?" He made the suggestion softly, but Bonaventure answered aloud:

"Figuratively speaking, 'tis conclude'; but—pardon—you mention' writing. Shall you paht f'om us not known—not leaving yo' name—in a copy-book, for examp'?"

"With pleasure. You do teach writing?"

"If I teach writing? To such desks, yes. 'Twould be to all but for the privation of desks. You perceive how we have here nothing less than a desk famine. Madelaine! Claude! Sidonie!—present, copy-book'! Sir, do you not think every chile should be provided a desk?—Ah! I knew 'twould be yo' verdic'. But how great trouble I have with that sub-ject! Me, I think yes; but the parents,"—he looked tenderly over among them,—“they contend no. Now, sir, here are three copy-books. Inspect; criticise. No, commence rather, if you please, with the copy-book of Madelaine; then *p'ceed* to the copy-book of Claude, and finally conclude at the copy-book of Sidonie; thus rising by degrees: good, more good, most good."

"How about," asked the stranger, with a

smile, as he turned the leaves, "about Toutou and Crébiche; don't they write?"

"Ah! sir," said Bonaventure, half to the stranger and half to the assemblage, "they write, yes; but—they ah yet in the pot-hook and chicken-track stage. And now, chil'run, in honor of our eminent friend's visitation, and of the excellence with which you have been examine', I p'announce the *exhibition* finish'—dispensing with 'Twink', twink' lil stah.' And now, in the book of the best writing scholar in the school—you, sir, deciding that intricacy—shall now be written the name of the eminent frien' of learning hereinbefo' confronting.—Claude! a new pen!"

The stranger made his choice among the books.

"Chil'run, he has select' the book of Sidonie!" Bonaventure reached and swung a chair into place at his desk. The visitor sat down. Bonaventure stood over him, gazing down at the hand that poised the pen. The silence was profound.

"Chil'run—sh-sh-sh!" said the master, lifting his left arm but not his eyes. The stranger wrote a single initial.

"G! chil'run; G!—Sir, does it not signify George?"

"Yes," murmured the writer; "it stands for George." He wrote another.

"W! my chil'run; George W!—Sir, does it not sig—*My* chil'run! George Washington! George Washington, my chil'run! George Washington, the father of his country! My chil'run and fellow-citizen' of Gran' Point', he is nominated for George Washington, the father of his country! Sir, ah you not a relation?"

"I really can't tell you," said the writer, with a calm smile. "I've always been too busy to look it up." He finished his signature as he talked. Bonaventure bent over it.

"Tar-box. Chil'run and friends and fellow-citizen', I have the p'oudness to int'roduce you the hono'able George Washington Tar-box! And now the exhibition is dismiss'; but stop! Sir, if some—aw all—desire gratefully to shake hand'?"

"I should feel honored."

"Attention, everybody! Make rank! Everybody by two by two, the school-chil'run coming last,—Claude and Sidonie resting till the end,—pass 'round—shake hand'—walk out—similah a fu-nial."

So came, shook hands, and passed out and to their simple homes, the manhood, motherhood, maidenhood, childhood of Grande Pointe, not knowing that before many days every household in the village was to be a subscriber to the "Album of Universal Information."

One of the last of the householders was

Chatoué. But when he grasped the honored hand, he also held it, fixing upon its owner a generous and somewhat bacchanalian smile.

"I'm a fool, but *I* know. You been put op a jawb on me. Dass four, five days now I been try to meck out what dat niggah at Belle Alliance holla to me when I gallop down de road." (Chatoué's English had been acquired from negroes in the sugar-house, and was like theirs.) "He been braggin' dat day befo'" — turning to Bonaventure — "how 'twas him show you de road to Gran' Point' las' year; and so I tell him, me," addressing the stranger again, "how we goin' git school shot op. Well, dat night I mit him comin' fum Gran' Point' and he hol' at me. I been try evva since meck out what he say. Yass. An' I *jis* meck it out! He say, 'Watch out, watch out,' Mian Roussel and dat book-fellah dawn't put op jawb on *you*.' Well, I'm a fool, but I know. You put op jawb on me; I know. But dass all right — *I don't take no book*." He laughed with the rest, scratched his tipsy head, and backed out through the *pieux*.

Only a fairy number remained, grouped around the honorable Tarbox. They were St. Pierre, Bonaventure, — Maximian detaining a middle-aged pair, Sidonie's timorous guard-

ians, — and two others, who held back, still waiting to shake hands.

"Claude," cried Bonaventure; "Sidonie."

They came. Claude shook hands and stepped aside. Sidonie, with eyes on the ground, put forth her hand. The honored guest held it lingeringly, and the ceremonies were at an end.

"Come," said 'Mian, beckoning away the great G. W.'s probable relative. They passed out together. "Come!" he repeated, looking back and beckoning again; "walk een! all han'! walk een house!"

The guardian pair followed, hand in hand.

"Claude," said Bonaventure tenderly; but —

"Claude," more firmly said St. Pierre.

The boy looked for one instant from the master's face to Sidonie's; then turned, grasped his father's hand, and followed the others.

A blaze of light filled Bonaventure's heart. He turned to Sidonie to give his hand — both her hands were clasped upon each other and they only tightened. But their eyes met — ah! those Acadian maidens, they do it all with their eyes! — and lover and maiden passed out and walked forth side by side. They are going that way still, only — with hands joined.

THE SONG OF SONGS.

THE Lark by Avon's side
When the leas were wet with dew,
Soaring heavenward, fain to hide
In the far celestial blue!
Light the wind of June went by;
Rose the mist in sunny mazes;
High o'er cloud and zephyr winging
To the angels soared he, singing
Golden sweet, — then silently
Dropped to rest amid the daisies.

How the building Thrushes sung
In gardens where the Limmat flows,
Just as morning's gate unswung
Flushing all the Alps with rose!
How the chorus jubilant
Floated over lake and river!
Life was joy and earth was young
While those building Thrushes sung; —
Ah! their melody will haunt
Zurich in my thought forever.

Lark and Thrush, I love you well;
But I heard a rarer song
As a wild March evening fell
Bleak New Hampshire's heights along.
Trees were bare and brooks were still;
On Kearsarge the snow was lying:
One red cloud athwart the gray
Faded, faded slow away,
And the north wind o'er the hill
Like the dirge of hope was sighing.

Hark! a Robin in the elm
Warbling notes so glad and free,
Straight he brought a summer realm
Over thousand leagues of sea!
High he sang: "A truce to fear!
Frost and storm are but the portal
We must pass ere June befall,
And the Lord is love through all!"
Lark and Thrush, your lays are dear,
But the Robin's is immortal!

ABRAHAM LINCOLN: A HISTORY.*

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

THE MOVEMENT FOR SLAVERY EXTENSION.

THE BALANCE OF POWER.

WE shall see in the course of the present work how the life of Abraham Lincoln divides itself into three principal periods, with corresponding stages of his intellectual development: the first, of about forty years, ending with

his term in Congress; the second, of about ten years, concluding with his final campaign of political speech-making in New York and New England, shortly before the presidential nominations of 1860; and the last, of about five years, terminating at his death. We have thus far traced his career through the first period of forty years. In the several stages of frontier experience through which he had passed, and which in the main but repeated the trials and vicissitudes of thousands of other boys and youths in the West, only so much individuality had been developed in him as brought him into the leading class of his contemporaries. He had risen from laborer to student, from clerk to lawyer, from politician to legislator. That he had lifted himself by healthy ambition and unaided industry out of the station of a farm-hand, whose routine life begins and ends in a backwoods log-cabin, to that representative character and authority which seated him in the national Capitol to aid in framing laws for his country, was already an achievement that may well be held honorably to crown a career of forty years.

Such achievement and such distinction, however, were not so uncommon as to appear phenomenal. Hundreds of other boys born in log-cabins had won similar elevation in the manly, practical school of western public life. Even in ordinary times there still remained within the reach of average intellects several higher grades of public service. It is quite probable that the superior talents of Lincoln would have made him Governor of Illinois or given him a term in the United States Senate. But the story of his life would not have commanded, as it now does, the unflagging attention of posterity had there not fallen upon his generation the unusual conditions and oppor-

tunities brought about by a series of remarkable convulsions in national politics. If we would correctly understand how Lincoln became, first a conspicuous actor, and then a chosen leader, in a great strife of national parties for supremacy and power, we must briefly study the origin and development of the great slavery controversy in American legislation which found its highest activity and decisive culmination in the single decade from 1850 to 1860. We should greatly err, however, if we attributed the new events in Lincoln's career to the caprice of fortune. The conditions and opportunities of which we speak were broadly national, and open to all without restriction of rank or locality. Many of his contemporaries had seemingly overshadowing advantages, by prominence and training, to seize and appropriate them to their own advancement. It is precisely this careful study of the times which shows us by what inevitable process of selection honors and labors of which he did not dream fell upon him; how, indeed, it was not the individual who gained the prize, but the paramount duty which claimed the man.

It is now universally understood, if not conceded, that the Rebellion of 1861 was instigated, begun, and carried on for the sole purpose of defending and preserving to the seceding States the institution of African slavery and making them the nucleus of a great slave empire, which in their ambitious dreams they hoped would include Mexico, Central America, and the West India Islands, and perhaps even the tropical States of South America. Both a real and pretended fear that slavery was in danger lay at the bottom of this design. The real fear arose from the palpable fact, impossible to conceal, that the slave system was a reactionary obstacle in the pathway of modern civilization and its political, material, philosophical, and religious development. The pretended danger was the permanent loss of political power by the slave States of the Union, as shown in the election of Lincoln to the presidency, which they averred would necessarily throw all the forces of the national life against the "peculiar institution," and crush it under forms of law. It was by magnifying this danger from a remote into an immediate consequence that they excited the population

of the cotton States to resistance and rebellion. Seizing this opportunity, it was their present purpose to establish a slave Confederacy, consisting of the cotton States, which should in due time draw to itself, by an irresistible gravitation of sympathy and interest, first, the border slave States, and, in the further progress of events, the tropical countries towards the equator.

The popular agitation, or war of words between the North and the South on the subject of slavery, which led to the armed insurrection was threefold: First, the economic effort to prevent the destruction of the monetary value of four millions of human beings held in bondage, who were bought and sold as chattels, and whose aggregate valuation, under circumstances existing at the outbreak of the civil war, was computed at \$400,000,000; second, a moral debate as to the abstract righteousness or iniquity of the system; and, third, a political struggle for the balance of power in government and public policy, by which the security and perpetuity of the institution might be guaranteed.

This sectional controversy over the institution of slavery in its threefold aspect had begun with the very birth of the nation, had continued with its growth, and become intensified with its strength. The very same year which saw the *Mayflower* land the Pilgrims on Plymouth Rock also saw a Dutch ship land a cargo of African slaves at Jamestown, in Virginia. During the long colonial period the English Government fostered and forced the importation of slaves to America equally with English goods. In the original draft of the Declaration of Independence, Thomas Jefferson invoked the reprobation of mankind upon the British King for his share in this inhuman traffic. On reflection, however, this was discovered to be but another case of Satan rebuking sin. The blood money which reddened the hands of English royalty stained equally those of many an American rebel. The public opinion of the colonies was already too much debauched to sit in unanimous moral judgment on this crime against humanity. The objections of South Carolina and Georgia sufficed to cause the erasure and suppression of the obnoxious paragraph. Nor were the Northern States guiltless: Newport was yet a great slave-mart, and the commerce of New England drew more advantage from the traffic than did the agriculture of the South. All the elements of the later controversy already existed. Slave codes and fugitive-slave laws,* abolition societies and emancipation bills, are older than our Constitution;

* Hurd, "Law of Freedom and Bondage," Vol. I., pp. 228 to 311.

and negro troops fought in the Revolutionary War for American independence.† Liberal men could be found in South Carolina who hated slavery, and narrow men in Massachusetts who defended it. But these individual instances of prejudice or liberality were submerged and lost in the current of popular opinion springing from prevailing interests in the respective localities, and institutions molded principles, until in turn principles should become strong enough to reform institutions. In short, slavery was one of the many "relics of barbarism"—like the divine right of kings, religious persecution, torture of the accused, imprisonment and enslavement for debt, witch-burning, and kindred "institutions"—which were transmitted to that generation from former ages as so many burdens of humanity, for help in the removal of which the new nation was in the providence of God perhaps called into existence. The whole matter in its broader aspects is part of that persistent struggle of the centuries between despotism and individual freedom; between arbitrary wrong, consecrated by tradition and law, and the unfolding recognition of private rights; between the thralldom of public opinion and the liberty of conscience; between the greed of gain and the Golden Rule of Christ. Whoever, therefore, chooses to trace the remote origin of the American Rebellion will find the germ of the Union armies of 1861-5 in the cabin of the *Mayflower*, and the inception of the Secession forces between the decks of that Dutch slaver which planted the fruit of her avarice and piracy in the James River colonies in 1620.

So elaborate and searching a study, however, is not necessary to the purposes of this work. A very brief mention of the principal landmarks of the long contest will serve to show the historical relation, and explain the phraseology, of its final issues.

The first of these great landmarks was the ordinance of 1787. All the States tolerated slavery and permitted the slave-trade during the Revolution. But in most of them the morality of the system was strongly drawn in question, especially by the abolition societies, which embraced many of the most prominent patriots. A public opinion, not indeed unanimous, but largely in the majority, demanded that the "necessary evil" should cease. When the Continental Congress came to the practical work of providing a government for the "Western lands," which the financial pressure and the absolute need of union compelled New York and Virginia to cede to the General Government, Thomas Jefferson, of pronounced anti-slavery views, proposed, among other features

† Williams, "Hist. Negro Race in America," Vol. I., pp. 333 to 369.

in his plan and draft of 1784, to add a clause prohibiting slavery in all the North-west territory after the year 1800. A North Carolina member, however, moved to strike out this clause. The form of the question put by the chairman was, "Shall the clause stand?" Sixteen members voted aye, and seven members voted no; but under the clumsy legislative machinery of the confederation these seven noes carried the question, since a majority of States had failed to vote in the affirmative.

Three years later, July 13, 1787, this first ordinance was repealed by a second, establishing our more modern form of territorial government. It is justly famed for many of its provisions; but its chief value is conceded to have been its sixth article, ordaining the immediate and perpetual prohibition of slavery. Upon this all the States present in Congress—three Northern and five Southern—voted in the affirmative; five States were absent, four Northern and one Southern. This piece of legislation is remarkable in that it was an entirely new bill, substituted for a former and altogether different scheme containing no prohibition whatever, and that it was passed through all the forms and stages of enactment in the short space of four days.* History sheds little light on the official transaction, but contemporary evidence points to the influence of a powerful lobby. Several plausible reasons are assigned why the three slave States of Maryland, Virginia, and North Carolina voted for this prohibition. First, the West was competing with the territory of Maine for settlers; second, the whole scheme was in the interest of the "Ohio Company," a newly formed Massachusetts emigrant aid society which immediately made a large purchase of lands; third, the unsettled regions south of the Ohio River had not yet been ceded to the General Government, and were therefore open to slavery from the contiguous Southern States; fourth, little was known of the extent or character of the great West; and, therefore, fifth, the Ohio River was doubtless thought to be a fair and equitable dividing line. The ordinance itself provided for the formation of not less than three nor more than five States, and under its shielding provisions Ohio, Indiana, Illinois, Michigan, and Wisconsin were added to the Union with free constitutions.

It does not appear that sectional motives operated for or against the foregoing enactment; they were probably held in abeyance by other considerations. But it must not be inferred therefrom that the slavery question was absent or dormant in the country. There was already a North and a South. At that very time the constitutional convention was

in session in Philadelphia. George Washington and his illustrious fellow-delegates were grappling with the novel problems of government which the happy issue of the Revolution and the lamentable failure of the Confederation forced upon the country. One of these problems was the presence of over half a million of slaves, nearly all in five Southern States. Should they be taxed? Should they be represented? Should the power to regulate commerce be allowed to control or terminate their importation? Vital questions these, which went not merely to the incidents but the fundamental powers of government. The slavery question seemed for months an irreconcilable element of discord in the convention. The slave-trade not only, but the domestic institution itself, was characterized in language which Southern politicians of later times would have denounced as "fanatical" and "incendiary." Pinckney wished the slaves to be represented equally with the whites, since they were the Southern peasantry. Gouverneur Morris declared that as they were only property they ought not to be represented at all. Both the present and the future balance of power in national legislation, as resulting from slaves already in, and hereafter to be imported into, old and new States, were debated under various possibilities and probabilities. Out of these divergent views grew the compromises of the Constitution. 1. The slaves were to be included in the enumeration for representation, *five* blacks to be counted as *three* whites. 2. Congress should have the right to prohibit the slave-trade, but not till the lapse of twenty years. 3. Fugitive slaves should be returned to their owners. Each State, large or small, was allowed two senators; and the apportionment of representatives gave to the North thirty-five members and fourteen senators, to the South thirty members and twelve senators. But since the North was not yet free from slavery, but only in process of becoming so, and as Virginia was the leading State of the Union, the real balance of power remained in the hands of the South.

The newly formed Constitution went into successful operation. Under legal provisions already made and the strong current of abolition sentiment then existing, all the Eastern and Middle States down to Delaware became free. This gain, however, was perhaps more than numerically counterbalanced by the active importation of captured Africans, especially into South Carolina and Georgia, up to the time the traffic ceased by law in 1808. Jefferson had meanwhile purchased of France the immense country west of the Mississippi known as the Louisiana

* Journals of Congress, 1787, p. 63.

Territory. The free navigation of that great river was assured, and the importance of the West immeasurably increased. The old French colonies at New Orleans and Kaskaskia were already strong outposts of civilization and the nuclei of spreading settlements. Attracted by the superior fertility of soil, by the limitless opportunities for speculation, by the enticing spirit of adventure, and pushed by the restless energy inherent in the Anglo-Saxon character, the older States now began to pour a rising stream of emigration into the West and the South-west.

In this race the free States, by reason of their greater population, wealth, and commercial enterprise, would have outstripped the South, but for the introduction of a new and powerful influence which operated exclusively in favor of the latter. This was the discovery of the peculiar adaptation of the soil and climate of portions of the Southern States, combined with cheap slave-labor, to the cultivation of cotton. Half a century of experiment and invention in England had brought about the concurrent improvement of machinery for spinning and weaving, and of the high-pressure engine to furnish motive power. The Revolutionary War was scarcely ended when there came from the mother-country a demand for the raw fiber, which promised to be almost without limit. A few trials sufficed to show Southern planters that with their soil and their slaves they could supply this demand, not only with a quality of cotton which would defy competition, but at a profit to themselves far exceeding that of any other product of agriculture. An insurmountable obstacle, however, seemed now to interpose itself between them and their golden harvest. The tedious work of cleaning the fiber from the seed apparently made its cheap preparation for export in large quantities impossible. A negro woman working the whole day could only clean a single pound.

It so happened that at this juncture, November, 1792, an ingenious Yankee student

from Massachusetts was boarding in the house of friends in Savannah, Georgia, occupying his leisure in reading law. A party of Georgia gentlemen from the interior, making a visit to this family, fell into conversation on the prospects and difficulties of cotton-culture and the imperative need of a rapidly working cleaning-machine. Their hostess, an intelligent and quick-witted woman, at once suggested an expedient. "Gentlemen," said Mrs. Greene, "apply to my young friend, Mr. Eli Whitney; he can make anything."* The Yankee student was sought, introduced, and had the mechanical problem laid before him. He modestly disclaimed his hostess's extravagant praises, and told his interviewers that he had never seen either cotton or cotton-seed in his life. Nevertheless, he went to work with such earnestness and success, that in a few months Mrs. Greene had the satisfaction of being able to invite a gathering of gentlemen from different parts of the State to behold with their own eyes the working of the newly invented cotton-gin, with which a negro man turning a crank could clean fifty pounds of cotton per day. This solution of the last problem in cheap cotton-culture made it at once the leading crop of the South. That favored region quickly drove all competitors out of the market; and the rise of English imports of raw cotton, from thirty million pounds in 1790 to over one thousand million pounds in 1860, shows the development and increase of that special industry, with all its related interests.† It was not till sixteen years after the invention of the cotton-gin that the African slave-trade ceased by limitation of law. Within that period many thousands of negro captives had been added to the population of the South by direct importation, and nearly thirty thousand slave inhabitants added by the acquisition of Louisiana,‡ and the formation of new slave States south of the Ohio River hastened in due proportion.§

It is a curious historical fact that, under

* *Memoir of Eli Whitney*, *American Journal Science*, 1832.

† The Virginia price of a male "field hand" in 1790 was two hundred and fifty dollars; in 1860 his value in the domestic market had risen to sixteen hundred dollars.—SHERARD CLEMENS, in *H. R. App. Globe*, 1860-61, 104-5.

‡ *Compendium*, 8th census, p. 13.

§ No word of the authors could add to the force and eloquence of the following from a recent letter of the son of the inventor of the cotton-gin (to the Art Superintendent of *THE CENTURY*), stating the claims of his father's memory to the gratitude of the South, hitherto apparently unfelt, and certainly unrecognized:

"NEW HAVEN, CONN., Dec. 4, 1886.

" . . . I send you a photograph taken from a portrait of my father, painted about the year 1821, by King, of Washington, when my father, the inventor

of the cotton-gin, was fifty-five years old. He died January 25th, 1825. The cotton-gin was invented in 1793; and though it has been in use for nearly one hundred years, it is virtually unimproved. . . . Hence the great merit of the original invention. It has made the South, financially and commercially. It has made England rich, and changed the commerce of the world. Lord Macaulay said of Eli Whitney: 'What Peter the Great did to make Russia dominant, Eli Whitney's invention of the cotton-gin has more than equaled in its relation to the power and progress of the United States.' He has been the greatest benefactor of the South, but it never has, to my knowledge, acknowledged his benefaction in a public manner to the extent it deserves—no monument has been erected to his memory, no town or city named after him, though the force of his genius has caused many towns and cities to rise and flourish in the South. . . .

"Yours very truly, E. W. WHITNEY."

the very remarkable material growth of the United States which now took place, the political influence remained so very evenly balanced between the North and the South for more than a generation. Other grave issues indeed absorbed the public attention, but the abeyance of the slavery question is due rather to the fact that no considerable advantage as yet fell to either side. Eight new States were organized, four north and four south of the Ohio, and admitted in nearly alternate order: Vermont in 1791, *free*; Kentucky in 1792, *slave*; Tennessee in 1796, *slave*; Ohio in 1802, *free*; Louisiana in 1812, *slave*; Indiana in 1816, *free*; Mississippi in 1817, *slave*; Illinois in 1818, *free*. Alabama was already authorized to be admitted with slavery, and this would make the number of free and slave States equal, giving eleven States to the North and eleven to the South.

The territory of Missouri, containing the old French colonies at and near St. Louis, had attained a population of 60,000, and was eager to be admitted as a State. She had made application in 1817, and now in 1819 it was proposed to authorize her to form a constitution. Arkansas was also being nursed as an applicant, and the prospective loss by the North and gain by the South of the balance of power caused the slavery question suddenly to flare up as a national issue. There were hot debates in Congress, emphatic resolutions by State legislatures, deep agitation among the whole people, and open threats by the South to dissolve the Union. Extreme Northern men insisted upon a restriction of slavery to be applied to both Missouri and Arkansas; radical Southern members contended that Congress had no power to impose any conditions on new States. The North had control of the House, the South of the Senate. A middle party thereupon sprang up, proposing to divide the Louisiana purchase between freedom and slavery by the line of 36° 30', and authorizing the admission of Missouri with slavery out of the northern half. Fastening this proposition upon the bill to admit Maine as a free State, the measure was, after a struggle, carried through Congress (in a separate act approved March 6, 1820), and became the famous Missouri Compromise. Maine and Missouri were both admitted. Each section thereby not only gained two votes in the Senate, but also asserted its right to spread its peculiar polity without question or hindrance within the prescribed limits; and the motto, "No extension of slavery," was postponed forty years, to the Republican campaign of 1860.

From this time forward, the maintenance of this balance of power,—the numerical equality of the slave States with the free,—

though not announced in platforms as a party doctrine, was nevertheless steadily followed as a policy by the representatives of the South. In pursuance of this system, Michigan and Arkansas, the former a *free* and the latter a *slave* State, were, on the same day, June 15, 1836, authorized to be admitted. These tactics were again repeated in the year 1845, when, on the 3d of March, Iowa, a *free* State, and Florida, a *slave* State, were authorized to be admitted by one act of Congress, its approval being the last official act of President Tyler. This tacit compromise, however, was accompanied by another very important victory of the same policy. The Southern politicians saw clearly enough that with the admission of Florida the slave territory was exhausted, while an immense untouched portion of the Louisiana purchase still stretched away north-westwardly toward the Pacific above the Missouri Compromise line, which consecrated it to freedom. The North, therefore, still had an imperial area from which to organize future free States, while the South had not a foot more of territory from which to create slave States.

Sagaciously anticipating this contingency, the Southern States had been largely instrumental in setting up the independent State of Texas, and were now urgent in their demand for her annexation to the Union. Two days before the signing of the Iowa and Florida bill, Congress passed, and President Tyler signed, a joint resolution, authorizing the acquisition, annexation, and admission of Texas. But even this was not all. The joint resolution contained a guarantee that "new States, of convenient size, not exceeding four in number, in addition to the said State of Texas," and to be formed out of her territory, should hereafter be entitled to admission—the Missouri Compromise line to govern the slavery question in them. The State of Texas was, by a later resolution, formally admitted to the Union, December 29, 1845. At this date, therefore, the slave States gained an actual majority of one, there being fourteen free States and fifteen slave States, with at least equal territorial prospects for the future.

If the North was alarmed at being thus placed in a minority, there was ample reason for still further disquietude. The annexation of Texas had provoked the Mexican war, and President Polk, in anticipation of further important acquisition of territory to the South and West, asked of Congress an appropriation of two millions to be used in negotiations to that end. An attempt to impose a condition to these negotiations that slavery should never exist in any territory to be thus acquired was the famous Wilmot Proviso. This particular measure failed, but the war ended, and New Mexico

and California were added to the Union as unorganized territories. Meanwhile the admission of Wisconsin in 1848 had once more restored the equilibrium between the free and the slave States, there being now fifteen of each.

It must not be supposed that the important political measures and results thus far summarized were accomplished by quiet and harmonious legislation. Rising steadily since 1820, the controversy over slavery became deep and bitter, both in Congress and the country. Involving not merely a policy of government, but a question of abstract morals, statesmen, philanthropists, divines, the press, societies, churches, and legislative bodies joined in the discussion. Slavery was assailed and defended in behalf of the welfare of the State, and in the name of religion. In Congress especially it had now been a subject of angry contention for a whole generation. It obtruded itself into all manner of questions, and clung obstinately to numberless resolutions and bills. Time and again it had brought members into excited discussion, and to the very verge of personal conflict in the legislative halls. It had occasioned numerous threats to dissolve the Union, and in one or more instances caused members actually to retire from the House of Representatives. It had given rise to resolutions of censure, to resignations, and had been the occasion of some of the greatest legislative debates of the nation. It had virtually created and annexed the largest State in the Union. In several States it had instigated abuse, intolerance, persecutions, trials, mobs, murders, destruction of property, imprisonment of free-men, retaliatory legislation, and one well-defined and formidable attempt at revolution. It originated party factions, political schools, and constitutional doctrines, and made and marred the fame of great statesmen.

New Mexico, when acquired, contained one of the oldest towns on the continent, and a considerable population of Spanish origin. California, almost simultaneously with her acquisition, was peopled in the course of a few months by the world-renowned gold discoveries. Very unexpectedly, therefore, to politicians of all grades and opinions, the slavery question was once more before the nation in the year 1850, over the proposition to admit both to the Union as States. As the result of the long conflict of opinion hitherto maintained, the beliefs and desires of the contending sections had by this time become formulated in distinct political doctrines. The North contended that Congress might and should prohibit slavery in all the territories of the Union, as had been done in the Northern half by the ordinance of 1787 and by the Missouri Compromise. The South declared that

any such exclusion would not only be unjust and impolitic, but absolutely unconstitutional, because property in slaves might go and must be protected in the territories in common with all other property. To the theoretical dispute was added a practical contest. By the existing Mexican laws slavery was already prohibited in New Mexico, and California promptly formed a free State constitution. Under these circumstances the North now sought to organize the former as a territory, and admit the latter as a State, while the South resisted and endeavored to extend the Missouri Compromise line, which would place New Mexico and the southern half of California under the tutelage and influence of slavery.

These were the principal points of difference which caused the great slavery agitation of 1850. The whole country was convulsed in discussion; and again more open threats and more ominous movements towards disunion came from the South. The most popular statesman of that day, Henry Clay of Kentucky, a slaveholder opposed to the extension of slavery, now, however, assumed the leadership of a party of compromise, and the quarrel was adjusted and quieted by a combined series of Congressional acts. 1. California was admitted as a free State. 2. The territories of New Mexico and Utah were organized, leaving the Mexican prohibition of slavery in force. 3. The domestic slave-trade in the District of Columbia was abolished. 4. A more stringent fugitive-slave law was passed. 5. For the adjustment of her State boundaries Texas received ten millions of dollars. These were the famous compromise measures of 1850. It has been gravely asserted that this indemnity of ten millions, suddenly trebling the value of the Texas debt, and thereby affording an unprecedented opportunity for speculation in the bonds of that State, was "the propelling force whereby these acts were pushed through Congress in defiance of the original convictions of a majority of its members."* But it must also be admitted that the popular desire for tranquillity, concord, and union in all sections never exerted as much influence upon Congress as then. This compromise was not at first heartily accepted by the people; Southern opinion being offended by the abandonment of the "property" doctrine, and Northern sentiment irritated by certain harsh features of the fugitive-slave law. But the rising Union feeling quickly swept away all ebullitions of discontent, and during two or three years people and politicians fondly dreamed they had, in current phraseology, reached a "finality" on this vexed quarrel. Grave doubts, however, found occa-

* Greeley, "Am. Conflict," Vol. I., p. 208.

sional expression and none perhaps more forcibly than in the following newspaper epigram describing "Finality":

"To kill twice dead a rattlesnake,
And off his scaly skin to take,
And through his head to drive a stake,
And every bone within him break,
And of his flesh mincemeat to make,
To burn, to sear, to boil, and bake,
Then in a heap the whole to rake,
And over it the besom shake,
And sink it fathoms in the lake —
Whence after all, quite wide awake,
Comes back that very same old snake!"

Little did the country think how soon the absurd prediction would find its fulfillment.

THE REPEAL OF THE MISSOURI COMPROMISE.

THE long contest in Congress over the compromise measures of 1850, and the reluctance of a minority, alike in the North and the South, to accept them, had in reality seriously demoralized both the great political parties of the country. The Democrats especially, defeated by the fresh military laurels of General Taylor in 1848, were much exercised to discover their most available candidate as the presidential election of 1852 approached. The leading names, Cass, Buchanan, and Marcy, having been long before the public, were becoming a little stale. In this contingency, a considerable following grouped itself about an entirely new man, Stephen A. Douglas of Illinois. Emigrating from Vermont to the West, Douglas had run a career remarkable for political success. Only in his thirty-ninth year, he had served as member of the legislature, as Attorney-General, as Secretary of State, and as judge of the Supreme Court in Illinois, and had since been three times elected to Congress and once to the Senate of the United States. Nor did he owe his political fortunes entirely to accident. Among his many qualities of leadership were strong physical endurance, untiring industry, a persistent boldness, a ready facility in public speaking, unfailing political shrewdness, an unusual power in running debate, with liberal instincts and progressive purposes. It was therefore not surprising that he should attract the admiration and support of the young, the ardent, and especially the restless and ambitious members of his party. His career in Congress was sufficiently conspicuous. As chairman of the Committee on Territories in the Senate, he had borne a prominent part in the enactment of the compromise measures of 1850, and had just met and overcome a threatened party schism in his own State, which that legislation had there produced.

In their zeal to push his claims to the presi-

dency, the partisans of Douglas now committed a great error. Rightly appreciating the growing power of the press, they obtained control of the "Democratic Review," a monthly magazine then enjoying prominent repute as a party organ, and published in it a series of articles attacking the rival Democratic candidates in very flashy rhetoric. These were stigmatized as "old fogies," who must give ground to a nominee of "Young America." They were reminded that the party expects a "new man." "Age is to be honored, but senility is pitiable"; "statesmen of a previous generation must get out of the way"; the Democratic party was owned by a set of "old clothes-horses"; "they couldn't pay their political promises in four Democratic administrations"; and the names of Cass and Marcy, Buchanan and Butler, were freely mixed in with such epithets as "pretenders," "hucksters," "intruders," and "vile charlatans."

Such characterization of such men soon created a flagrant scandal in the Democratic party, which was duly aired both in the newspapers and in Congress. It definitely fixed the phrases "old fogy," and "Young America" in our slang literature. The personal friends of Douglas hastened to explain and assert his innocence of any complicity with this political raid, but they were not more than half believed; and the war of factions, begun in January, raged with increasing bitterness till the Democratic National Convention met at Baltimore in June, and undoubtedly exerted a decisive influence over the deliberations of that body.

The only serious competitors for the nomination were the "old fogies" Cass, Marcy, and Buchanan on the one hand, and Douglas, the pet of "Young America," on the other. It soon became evident that opinion was so divided among these four that a nomination could only be reached through long and tedious balloting. Beginning with some twenty votes, Douglas steadily gained adherents till on the thirtieth ballot he received ninety-two. From this point, however, his strength fell away. Unable to succeed himself, he was nevertheless sufficiently powerful to defeat his adversaries. The exasperation had been too great to permit a concentration or compromise on any of the "seniors." Cass reached only one hundred and thirty-one votes; Marcy, ninety-eight; Buchanan, one hundred and four; and finally, on the forty-ninth ballot, occurred the memorable nearly unanimous selection of Franklin Pierce — not because of any merit of his own, but to break the insurmountable dead-lock of factional hatred. Young America gained a nominal triumph, old fogydom a real revenge, and the South a serviceable Northern ally.

The country was the only sufferer, for in due time Pierce was overwhelmingly elected, and the nation burdened with that costly luxury, an administration without either personal or party responsibility. Douglas and his friends were discomfited but not dismayed. Their management had been exceedingly maladroit, as a more modest championship would without doubt have secured him the coveted nomination. Yet sagacious politicians foresaw that on the whole he was strengthened by his defeat. From that time forward he was a recognized presidential aspirant and competitor, young enough patiently to bide his time, and of sufficient prestige to make his flag the rallying-point of all the free-lances in the Democratic party.

It is to this presidential aspiration of Mr. Douglas that we must look as the key or explanation of his agency in bringing about the repeal of the Missouri Compromise — perhaps the most momentous legislative act in American history. As already said, after some factious opposition the measures of 1850 had been accepted by the people as a finality of the slavery questions. Around this alleged settlement, distasteful as it was to many, public opinion gradually crystallized. Both the National Conventions of 1852 solemnly resolved that they would discountenance and resist, in Congress or out of it, whenever, wherever, or however, or under whatever color or shape, any further renewal of the slavery agitation. This determination was echoed and reëchoed, affirmed and reaffirmed, by the recognized organs of the public voice — from the village newspaper to the presidential message, from the country debating school to the measured utterances of Senatorial discussion. In support of this alleged “finality” no one had taken a more decided stand than Senator Douglas himself. Said he, “In taking leave of this subject I wish to state that I have determined never to make another speech upon the slavery question; and I will now add the hope that the necessity for it will never exist. . . . So long as our opponents do not agitate for repeal or modification, why should we agitate for any purpose? We claim that the compromise [of 1850] is a final settlement. Is a final settlement open to discussion and agitation and controversy by its friends? What manner of settlement is that which does not settle the difficulty and quiet the dispute? Are not the friends of the compromise becoming the agitators, and will not the country hold us responsible for that which we condemn and denounce in the abolitionists and Free-soilers? These are matters worthy of our consideration. Those who preach peace should not be the first to commence and reopen an old quarrel.”* In his Senate speeches, during the com-

promise debates of 1850, while generally advocating his theory of “non-intervention,” he had sounded the whole gamut of the slavery discussion, defending the various measures of adjustment against the attacks of the Southern extremists, and specifically defending the Missouri Compromise. Nay, more; he had declared in distinct words that the principle of territorial prohibition was no violation of Southern rights; and denounced the proposition of Calhoun to put a “balance of power” clause into the Constitution as “a retrograde movement in an age of progress that would astonish the world.”† These repeated affirmations, taken in connection with his famous description of the Missouri Compromise in 1849, in which he declared it to have had “an origin akin to the Constitution,” and to have become “canonized in the hearts of the American people as a sacred thing which no ruthless hand would ever be reckless enough to disturb,”‡ all seemed, in the public mind, to put it beyond the reach of possibility that their author would so soon become the subject of his own anathemas.

The personal details of this most remarkable of all our political intrigues are forever lost to history. We have only a faint and shadowy outline of isolated movements of a few chief actors, a few vague suggestions and fragmentary steps in the formation and unfolding of the ill-omened plot.

As the avowed representative of the restless and ambitious elements of the country, as the champion of “Young America,” Douglas had so far as possible in his Congressional career made himself the apostle of modern “progress.” He was a believer in “manifest destiny” and a zealous advocate of the Monroe doctrine. He desired — so the newspapers averred — that the Carribean Sea should be declared an American lake, and nothing so delighted him as to pull the beard of the British lion. These topics, while they furnished themes for campaign speeches, for the present led to no practical legislation. In his position as chairman of the Senate Committee on Territories, however, he had control of kindred measures of present and vital interest to the people of the West; namely, the opening of new routes of travel and emigration, and of new territories for settlement. An era of wonder had just dawned, connecting itself directly with these subjects. The acquisition of California and the discovery of gold had turned the eyes of the whole civilized world to the Pacific coast. Plains and

AFTER A PORTRAIT BY KING.

mountains were swarming with adventurers and emigrants. Oregon, Utah, New Mexico, and Minnesota had just been organized, and were in a feeble way contesting the sudden fame of the Golden State. The Western border was astir, and wild visions of lands and cities and mines and wealth and power were disturbing the peaceful dreams of the pioneer in his frontier cabin, and hurrying him off on the long, romantic quest across the continent.

Hitherto, stringent Federal laws had kept settlers and unlicensed traders out of the Indian territory, which lay beyond the western boundaries of Arkansas, Missouri, and Iowa, and which the policy of our early Presidents

fixed upon as the final asylum of the red men retreating before the irresistible advance of white settlers. But now the uncontrollable stream of emigration had broken into and through this reservation, creating in a few years well-defined routes of travel to New Mexico, Utah, California, and Oregon. Though from the long march there came constant cries of danger and distress, of starvation and Indian massacre, there was neither halting nor delay. The courageous pioneers pressed forward all the more earnestly, and to such purpose that in less than twenty-five years the Pacific Railroad followed Frémont's first exploration through the South Pass.

Douglas, himself a migratory child of fortune, was in thorough sympathy with this somewhat premature Western longing of the people; and as chairman of the Committee on Territories was the recipient of all the letters, petitions, and personal solicitations from the

tories. It is but just to his fame, however, to say that he comprehended equally well the true philosophical and political necessities which now demanded the opening of Kansas and Nebraska as a secure highway and protecting bridge to the Rocky Mountains and our new-found El Dorado, no less than as a bond of union between the older States and the improvised "Young America" on the Pacific coast. The subject was not yet ripe for action during the stormy politics of 1850-51, and had again to be postponed for the presidential campaign of 1852. But now Pierce was triumphantly elected, with a Democratic Congress to sustain him, and the legislative calm which both parties had adjoined in their platforms seemed propitious for pushing measures of local interest. The control of the territories was for the moment completely in the hands of Douglas. He was himself chairman of the Committee of the Senate; and his special personal friend and political lieutenant in his own State, Richardson of Illinois, was chairman of the Territorial Committee of the House. He could therefore choose his own time and mode of introducing measures of this character in either house of Congress, under the majority control of his party—a fact to be constantly borne in mind when we consider the origin and progress of "the three Nebraska bills."

The journal discloses that Richardson of Illinois, chairman of the Committee on Territories of the House of Representatives, on February 2, 1853, introduced into the House "A bill to organize the Territory of Nebraska."* After due reference, and some desultory debate on the 8th,† it was taken up and passed by the House on the 10th.‡ From the discussion we learn that the boundaries were the Missouri River on the east, the Rocky Mountains on the west, the line of 36° 30' or southern line of Missouri on the south, and the line

various interests which were seeking their advantage in this exodus toward the setting sun. He was the natural center for all the embryo mail contractors, office-holders, Indian traders, land-sharks, and railroad visionaries whose coveted opportunities lay in the Western terri-

of 43°, or near the northern line of Iowa, on the north. Several members opposed it, because the Indian title to the lands was not yet extinguished, and because it embraced reservations pledged to Indian occupancy in perpetuity; also on

the general ground that it contained but few white inhabitants, and its organization was therefore a useless expense. Howard of Texas made the most strenuous opposition, urging that since it contained but about six hundred souls, its southern boundary should be fixed at 39°

30', not to trench upon the Indian reservations. Hall of Missouri replied in support of the bill: "We want the organization of the Territory of Nebraska not merely for the protection of the few people who reside there, but also for the protection of Oregon and California in time

WILLIAM A. RICHARDSON. (PHOTOGRAPHED BY BRADY.)

of war, and the protection of our commerce and the fifty or sixty thousand emigrants who annually cross the plains."* He added that its limits were purposely made large to embrace the great lines of travel to Oregon, New Mexico, and California; since the South Pass is in $42^{\circ} 30'$, the territory has to extend to 43° north.

The incident, however, of special historical significance had occurred in the debate of the 8th, when a member rose and said: "I wish to inquire of the gentleman from Ohio [Mr. Giddings], who, I believe, is a member of the Committee on Territories, why the ordinance of 1787 is not incorporated in this bill? I should like to know whether he or the committee were intimidated on account of the platforms of 1852?"† To which Mr. Giddings replied that the south line of the territory was $36^{\circ} 30'$, and was already covered by the Missouri Compromise prohibition. "This law stands perpetually, and I do not think that this act would receive any increased validity by a reënactment. There I leave the matter. It is very clear that the territory included in this treaty [ceding Louisiana] must be forever free unless the law be repealed." With this explicit understanding from a member of the committee, apparently accepted as conclusive by the whole House, and certainly not ob-

jected to by the chairman, Mr. Richardson, who was carefully watching the current of debate, the bill passed on the 10th,‡ ninety-eight yeas to forty-three nays. Led by a few members from that region, in the main the West voted for it and the South against it; while the greater number, absorbed in other schemes, were wholly indifferent, and probably cast their votes upon personal solicitation.

On the following day the bill was hurried over to the Senate, referred to Mr. Douglas's committee, and by him reported back without amendment, on February 17th; but the session was almost ended before he was able to gain the attention of the Senate for its discussion. Finally, on the night before the inauguration of President Pierce, in the midst of a fierce and protracted struggle over the appropriation bills, while the Senate was without a quorum and impatiently awaiting the reports of a number of conference committees, Douglas seized the opportunity of the lull to call up his Nebraska bill. Here again, as in the House, Texas stubbornly opposed it. Houston undertook to talk it to death in a long speech; Bell protested against robbing the Indians of their guaranteed rights. The bill seemed to have no friend

but its author when, perhaps to his surprise, Senator D. R. Atchison of Missouri threw himself into the breach.

SAM HOUSTON.

* *Globe*, p. 559. † *Ib.*, p. 543. ‡ *Ib.*, p. 565.

Prefacing his remarks with the statement that he had formerly been opposed to the measure, he continued: "I had two objections to it. One was that the Indian title in that territory had not been extinguished, or at least a very small portion of it had been. Another was the Missouri Compromise, or, as it is commonly called, the Slavery Restriction. It was my opinion at that time — and I am not now very clear on that subject — that the law of Congress, when the State of Missouri was admitted into the Union, excluding slavery from the territory of Louisiana north of 36° 30', would be enforced in that territory unless it was specially rescinded; and whether that law was in accordance with the Constitution of the United States or not, it would do its work, and that work would be to preclude slaveholders from going into that territory. But when I came to look into that question, I found that there was no prospect, no hope, of a repeal of the Missouri Compromise excluding slavery from that territory. . . . I have always been of opinion that the first great error committed in the political history

of this country was the ordinance of 1787, rendering the North-west territory free territory. The next great error was the Missouri Compromise. But they are both irremediable. There is no remedy for them. We must submit to them. I am prepared to do it. It is evident that the Missouri Compromise cannot be repealed. So far as that question is concerned, we might as well agree to the admission of this territory now as next year, or five or ten years hence."*

Mr. Douglas closed the debate, advocating the passage of the bill for general reasons, and by his silence accepting Atchison's conclusions; but as the morning of the 4th of March was breaking, an unwilling Senate laid the bill on the table by a vote of twenty-three to seventeen, here, as in the House, the West being for and the South against the measure. It is not probable, however, that in this course the South acted with any mental reservation or sinister motive. The great breach of faith was not yet even meditated. Only a few hours afterward, in a dignified and stately national ceremonial, in the midst of foreign

* *Globe*, p. 1113.

DAVID R. ATCHISON. (FROM A DAGUERRETYPE.)

ministers, judges, senators, and representatives, the new President of the United States delivered to the people his inaugural address. High and low were alike intent to discern the opening political currents of the new administration, but none touched or approached this particular subject. The aspirations of "Young America" were not toward a conquest of the North, but the enlargement of the South. A freshening breeze filled the sails of "annexation" and "manifest destiny." In bold words the President said: "The policy of my administration will not be controlled by any timid forebodings of evil from expansion. Indeed, it is not to be disguised that our attitude as a nation and our position on the globe render the acquisition of certain possessions not within our jurisdiction eminently important for our protection, if not in the future essential for the preservation of the rights of commerce and the peace of the world."† Reaching the slavery question, he expressed unbounded devotion to the Union, and declared slavery recognized by the Constitution, and his purpose to enforce the compromise measures of

† Pierce, Inaugural Address, March 4, 1853.

WILLIAM AIKEN. (PHOTOGRAPHED BY BRADY.)

1850; adding, "I fervently trust that the question is at rest, and that no sectional or ambitious or fanatical excitement may again threaten the durability of our institutions, or obscure the light of our prosperity."

When Congress met again in the following December (1853), the annual message of President Pierce was, upon this subject, but an echo of his inaugural, as his inaugural had been but an echo of the two party platforms of 1852. Affirming that the compromise measures of 1850 had given repose to the country, he declared, "That this repose is to suffer no shock during my official term, if I have the power to avert it, those who placed me here may be assured." In this spirit, undoubtedly, the Democratic party and the South began the session of 1853-4; but unfortunately it was very soon abandoned. The people of the Missouri and Iowa border were becoming every day more impatient to enter upon an authorized occupancy of the new lands which lay a day's journey to the west. Handfuls of squatters here and there had elected two territorial delegates, who hastened to Washington with embryo credentials. The subject of organizing the West was again broached; an Iowa Senator introduced a territorial bill. Under the ordinary routine it was referred to the Committee on Territories, and on the 4th day of January Douglas reported

back his second Nebraska bill, still without any repeal of the Missouri Compromise. His elaborate report, accompanying this second bill, shows that the subject had been most carefully examined in committee. The discussion was evidently exhaustive, going over the whole history, policy, and constitutionality of prohibitory legislation. Two or three sentences are quite sufficient to present the substance of the long and wordy report. First, that there were differences and doubts; second, that these had been finally settled by the compromise measures of 1850; and, therefore, third, the committee had adhered not only to the spirit but to the very phraseology of that adjustment, and refused either to affirm or repeal the Missouri Compromise.

This was the public and legislative agreement announced to the country. Subsequent revelations show the secret and factional bargain which that agreement covered. Not only was this territorial bill searchingly considered in committee, but repeated caucuses were held by the Democratic leaders to discuss the party results likely to grow out of it.

The Southern Democrats maintained that the Constitution of the United States recognized their right and guaranteed them protection to their slave property, if they chose to carry it into Federal territories. Douglas and other Northern Democrats contended that slavery was subject to local law, and that the people of a territory, like those of a State, could establish or prohibit it. This radical difference, if carried into party action, would lose them the political ascendancy they had so long maintained, and were then enjoying. To avert a public rupture of the party, it was agreed "that the territories should be organized with a delegation by Congress of all the power of Congress in the territories, and that the extent of the power of Congress should be determined by the courts."* If the courts should decide against the South, the Southern Democrats would accept the Northern theory; if the courts should decide in favor of the South, the Northern Democrats would defend the Southern view. Thus harmony would be preserved, and party power prolonged. Here we have the shadow of the coming Dred Scott decision already projected into political history, though the speaker protests that "none of us knew of the existence of a controversy

* Senator Benjamin, Senate debate, May 8, 1860. *Globe*, p. 1966.

then pending in the Federal courts that would lead almost immediately to the decision of that question."* This was probably true; for a "peculiar provision"† was expressly inserted in the committee's bill, allowing appeals to the Supreme Court of the United States in all questions involving title to slaves, without reference to the usual limitations in respect to the value of the property, thereby paving the way to an early adjudication by the Supreme Court.

Thus the matter rested till the 16th of January, when Senator Dixon of Kentucky, apparently acting for himself alone, offered an amendment in effect repealing the Missouri Compromise. Upon this provocation, Senator Sumner of Massachusetts the next day offered another amendment affirming that it was not repealed by the bill. Commenting on these propositions two days later, the administration organ, the "Washington Union," declared they were both "false lights," to be avoided by all good Democrats. By this time, however, this subject of "repeal" had become bruited about the Capitol corridors, the hotels, and the caucus rooms of Washington, and newspaper correspondents were on the *qui vive* to obtain the latest developments concerning the intrigue. The secrets of the Territorial Committee leaked out, and consultations multiplied. Could a repeal be carried? Who would offer it and lead it? What divisions or schisms would it carry into the ranks of the Democratic party, especially in the pending contest between the "Hards" and "Softs" in New York? What effect would it have upon the presidential election of 1856? Already the "Union" suggested that it was whispered that Cass was willing to propose and favor such a "repeal."‡ It was given out in the "Baltimore Sun" that Cass intended to "separate the sheep from the goats." Both statements were untrue; but they perhaps had their intended effect, to arouse the jealousy and eagerness of Douglas. The political air of Washington was heavy with clouds and mutterings, and clans were

ARCHIBALD DIXON. (FROM A DAGUERRETYPE.)

gathering for and against the ominous proposition.

So far as history has been allowed a glimpse into these secret communings, three principal personages were at this time planning a movement of vast portent. These were Stephen A. Douglas, chairman of the Senate Committee on Territories; Archibald Dixon, Whig Senator from Kentucky; and David R. Atchison of Missouri, then president *pro tempore* of the Senate, and acting Vice-President of the United States. "For myself," said the latter in explaining the transaction, "I am entirely devoted to the interests of the South, and I would sacrifice everything but my hope of heaven to advance her welfare." He thought the Missouri Compromise ought to be repealed; he had pledged himself in his public addresses to vote for no territorial organization that would not virtually annul it; and with this feeling in his heart, he desired to be the chairman of the Senate Committee on Territories when a bill was introduced. With this object in view, he had a private interview with Mr. Douglas, and informed him of what he desired—the introduction of a bill for

NATHANIEL P. BANKS. (PHOTOGRAPHED BY BRADY.)

Nebraska like what [*sic*] he had promised to vote for, and that he would like to be the chairman of the Committee on Territories in order to introduce such a measure; and if he could get that position, he would immediately resign as president of the Senate. Judge Douglas requested twenty-four hours to consider the matter, and if at the expiration of that time he could not introduce such a bill as he (Mr. Atchison) proposed, he would resign as chairman of the Territorial Committee in Democratic caucus, and exert his influence to

get him (Atchison) appointed. At the expiration of the given time, Senator Douglas signified his intention to introduce such a bill as had been spoken of."*

Senator Dixon is no less explicit in his description of these political negotiations. "My amendment seemed to take the Senate by surprise, and no one appeared more startled than Judge Douglas himself. He immediately came to my seat and courteously remonstrated

* Speech at Atchison City, September, 1854, reported in the "Parkville Luminary."

against my amendment, suggesting that the bill which he had introduced was almost in the words of the territorial acts for the organization of Utah and New Mexico; that they being a part of the compromise measures of 1850, he had hoped that I, a known and zealous friend of the wise and patriotic adjustment which had then taken place, would not be inclined to do anything to call that adjustment in question or weaken it before the country.

"I replied that it was precisely because I had been and was a firm and zealous friend of the compromise of 1850, that I felt bound to persist in the movement which I had originated; that I was well satisfied that the Missouri Restriction, if not expressly repealed, would continue to operate in the territory to which it had been applied, thus negating the great and salutary principle of *non-intervention*, which constituted the most prominent and essential feature of the plan of settlement of 1850. We talked for some time amicably, and separated. Some days afterwards Judge Douglas came to my lodgings, whilst I was confined by physical indisposition, and urged me to get up and take a ride with him in his carriage. I accepted his invitation, and rode out with him. During our short excursion we talked on the subject of my proposed amendment, and Judge Douglas, to my high gratification, proposed to me that I should allow him to take charge of the amendment and ingraft it on his territorial bill. I acceded to the proposition at once, whereupon a most interesting interchange occurred between us.

"On this occasion Judge Douglas spoke to me in substance thus: 'I have become perfectly satisfied that it is my duty, as a fair-minded national statesman, to coöperate with you as proposed in securing the repeal of the Missouri Compromise restriction. It is due to the South; it is due to the Constitution, heretofore palpably infracted; it is due to that character for consistency which I have heretofore labored to maintain. The repeal, if we can effect it, will produce much stir and commotion in the free States of the Union for a

season. I shall be assailed by demagogues and fanatics there without stint or moderation. Every opprobrious epithet will be applied to me. I shall be probably hung in effigy in many places. It is more than probable that I may become permanently odious among those whose friendship and esteem I have heretofore possessed. This proceeding may end my political career. But, acting under the sense of the duty which animates me, I am prepared to make the sacrifice. I will do it.'

"He spoke in the most earnest and touching manner, and I confess that I was deeply affected. I said to him in reply: 'Sir, I once recognized you as a demagogue, a mere party manager, selfish and intriguing. I now find you a warm-hearted and sterling patriot. Go forward in the pathway of duty as you propose, and though all the world desert you, I never will.'"*

Such is the circumstantial record of this most remarkable political intrigue left by two prominent and principal instigators, and never denied nor repudiated by the third. Gradually, as the plot was developed, the agreement embraced the leading elements of the Democratic party in Congress, reënforced by a majority of the Whig leaders from the slave States. A day or two before the final introduction of the repeal, Douglas and others held an interview with President Pierce,[†] and obtained from him in writing an agreement to adopt the movement as an administration measure. Fortified with this important adhesion, he took the fatal plunge, and on January 23d introduced his third Nebraska bill, organizing two territories instead of one, and declaring the Missouri Compromise "inoperative." But the amendment—monstrous Caliban of legislation as it was—needed to be still further licked into shape to satisfy the grasping rapacity of the South and appease the alarmed conscience of the North. Two weeks later, after the first outburst of debate, the following phraseology was substituted: "Which being inconsistent with the principle of non-intervention by Congress with slavery in the States and territories, as recognized

* Archibald Dixon to H. S. Foote, October 1, 1858. "Louisville Democrat" of October 3, 1858.

† Jefferson Davis, who was a member of President Pierce's Cabinet (Secretary of War), thus relates the incident: "On Sunday morning, the 22d of January, 1854, gentlemen of each committee [House and Senate Committees on Territories] called at my house, and Mr. Douglas, chairman of the Senate Committee, fully explained the proposed bill, and stated their purpose to be, through my aid, to obtain an interview on that day with the President, to ascertain whether the bill would meet his approbation. The President was known to be rigidly opposed to the reception of visits on Sunday for the discussion of any political subject; but in this case it was urged as necessary, in order to

enable the committee to make their report the next day. I went with them to the executive mansion, and, leaving them in the reception-room, sought the President in his private apartments, and explained to him the occasion of the visit. He thereupon met the gentlemen, patiently listened to the reading of the bill and their explanations of it, decided that it rested upon sound constitutional principles, and recognized in it only a return to that rule which had been infringed by the compromise of 1820, and the restoration of which had been foreshadowed by the legislation of 1850. This bill was not, therefore, as has been improperly asserted, a measure inspired by Mr. Pierce or any of his Cabinet."—Davis, "Rise and Fall of the Confederate Government," Vol. I., p. 28.

by the legislation of 1850 (commonly called the Compromise measures), is hereby declared inoperative and void; it being the true intent and meaning of this act not to legislate slavery into any territory or State, nor to exclude it therefrom, but to leave the people thereof perfectly free to form and regulate their domestic institutions in their own way, subject only to the Constitution"—a change which Benton truthfully characterized as "a stump speech injected into the belly of the Nebraska bill."

The storm of agitation which this measure aroused dwarfed all former ones in depth and intensity. The South was nearly united in its behalf, the North sadly divided in opposition. Against protest and appeal, under legislative whip and spur, with the tempting smiles and patronage of the administration, after nearly a four-months' struggle, the plighted faith of a generation was violated, and the repealing act passed—mainly by the great influence and example of Douglas, who had only five years previously so fittingly described the Missouri Compromise as being "akin to the Constitution," and "canonized in the hearts of the American people as a sacred thing which no ruthless hand would ever be reckless enough to disturb."

THE DRIFT OF POLITICS.

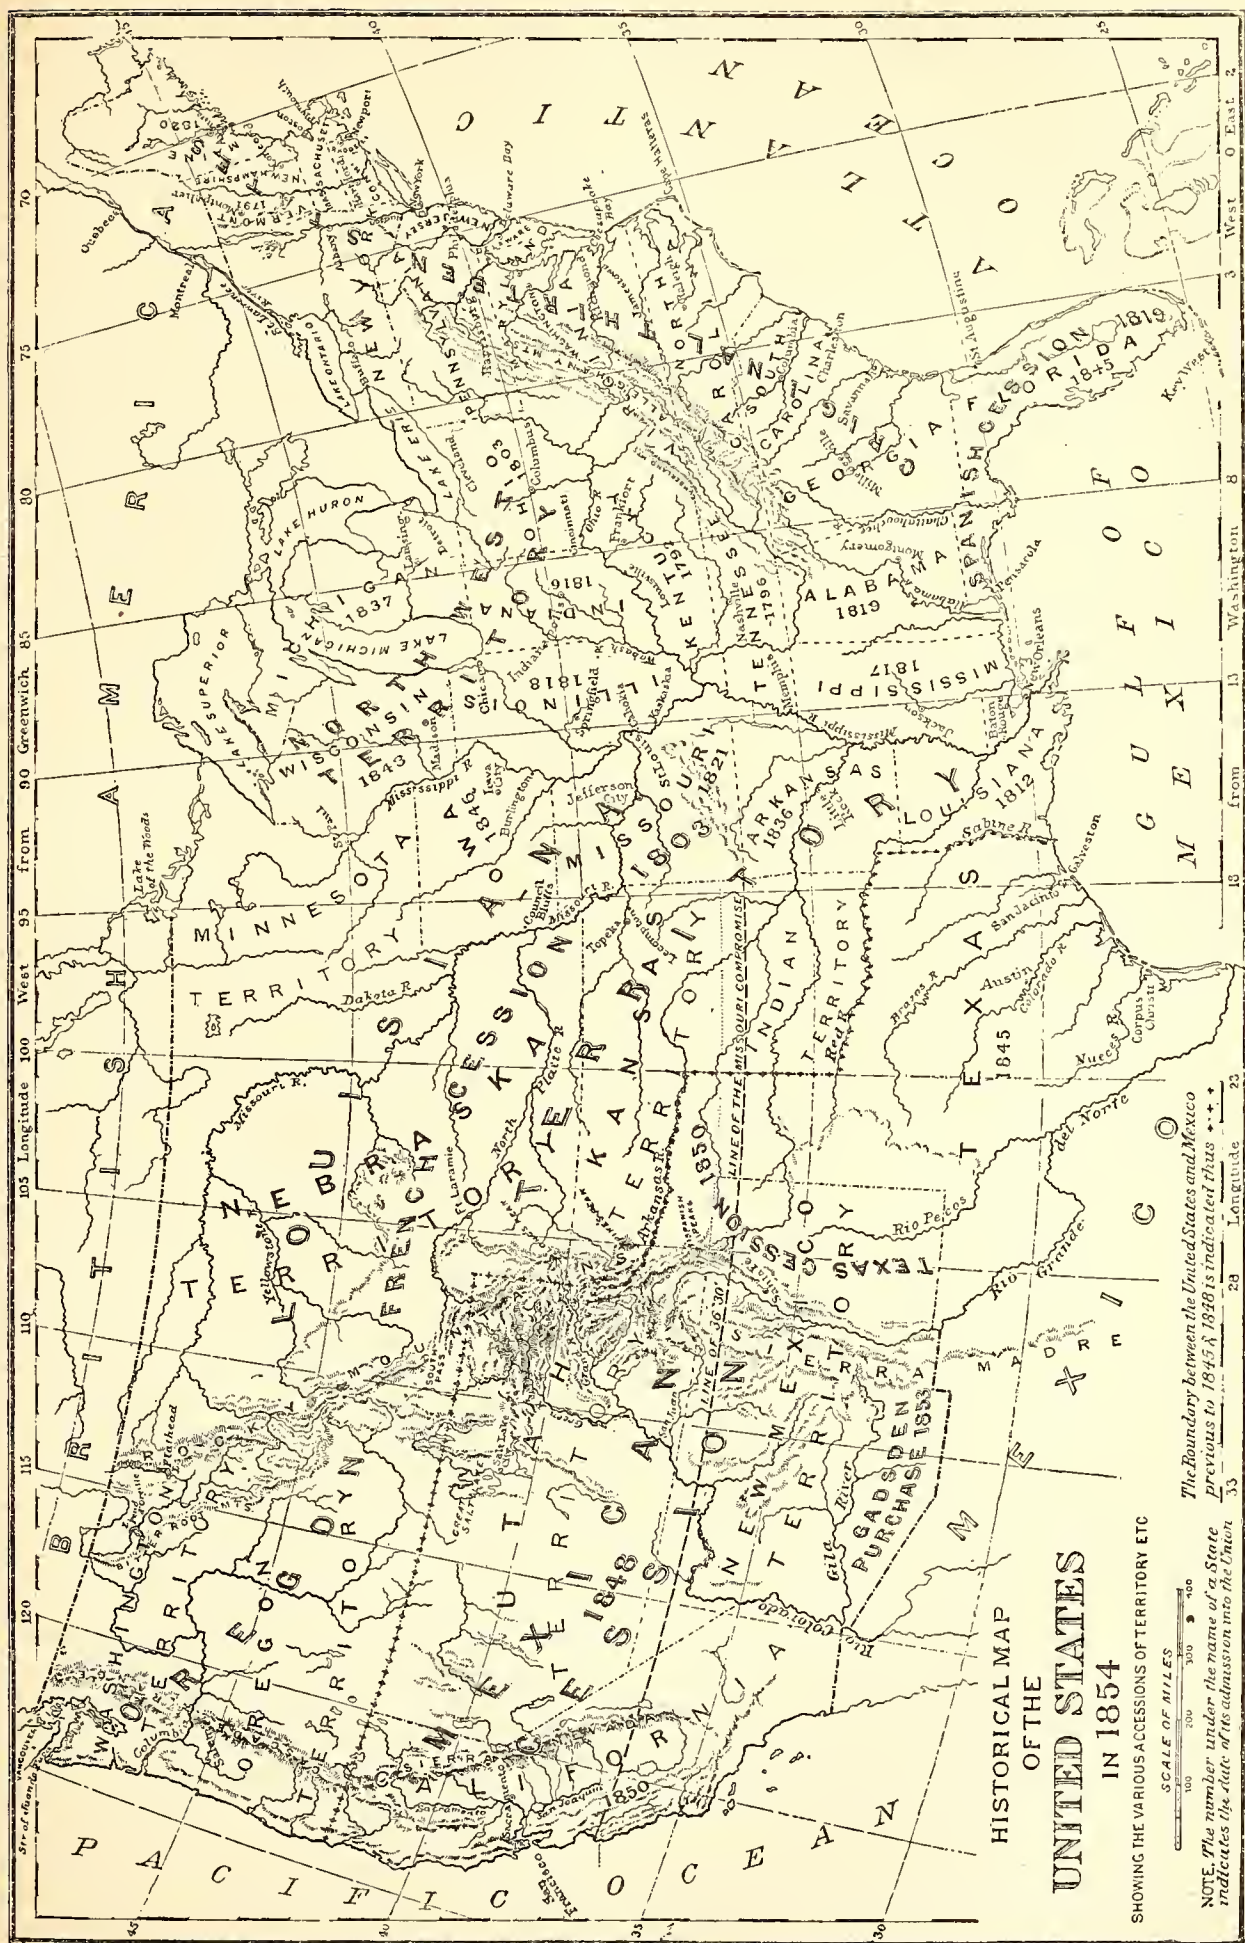

THE repeal of the Missouri Compromise made the slavery question paramount in every State of the Union. The boasted finality was a broken reed; the life-boat of compromise a hopeless wreck. If the agreement of a generation could be thus annulled in a breath, was there any safety even in the Constitution itself? This feeling communicated itself to the Northern States at the very first note of warning, and every man's party fealty was at once decided by his toleration of or opposition to slavery. While the fate of the Nebraska bill hung in a doubtful balance in the House, the feeling found expression in letters, speeches, meetings, petitions, and remonstrances. Men were for or against the bill—every other political subject was left in abeyance. The measure once passed, and the Compromise repealed, the first natural impulse was to combine, organize, and agitate for its restoration. This was the ready-made, common ground of coöperation.

It is probable that this merely defensive energy would have been overcome and dissipated, had it not just at this juncture been inspired and led by the faction known as the Free-soil party of the country, composed mainly of men of independent antislavery views, who had now during four presidential

campaigns been organized as a distinct political body, with no near hope of success, but animated mainly by the desire to give expression to their deep personal convictions. If there were demagogues here and there among them, seeking merely to create a balance of power for bargain and sale, they were unimportant in number, and only of local influence, and soon became deserters. There was no mistaking the earnestness of the body of this faction. A few fanatical men, who had made it the vehicle of violent expressions, had kept it under the ban of popular prejudice. It had long been held up to public odium as a revolutionary band of "abolitionists." All the abolitionists were doubtless in this party, but the party was not all composed of abolitionists. Despite all oburgation and contempt, however, it had become since 1840 a constant factor and a growing influence in politics. It had operated as a negative balance of power in the last two presidential elections, causing, by its diversion of votes, and more especially by its relaxing influence upon parties, the success of the Whig candidate, General Taylor, in 1848, and the Democratic nominee, Franklin Pierce, in 1852.

This small army of antislavery veterans, over one hundred and fifty-eight thousand voters in the aggregate, and distributed in detachments of from three thousand to thirty thousand in twelve of the free States, now came to the front with spirit and alacrity, and with its newspapers and speakers trained in the discussion of the subject, and its committees and affiliations already in action and correspondence, bore the brunt of the fight against the repeal. Hitherto its aims had appeared Utopian, and its resolves had been denunciatory and exasperating. Now, however, combining wisdom with opportunity, it became conciliatory, and, abating something of its abstractions, made itself the exponent of a demand for a present and practical reform—a simple return to the ancient faith and landmarks. It labored specially to bring about the dissolution of the old party organizations and the formation of a new one, based upon the general policy of resisting the extension of slavery. Since, however, the repeal had shaken but not obliterated old party lines, this effort succeeded only in favorable localities.

For the present, party disintegration was slow; men were reluctant to abandon their old-time principles and associations. The united efforts of Douglas and the administration held the body of the Northern Democrats to his fatal policy, though protests and defections became alarmingly frequent. On the other hand, the great mass of Northern Whigs promptly opposed the repeal, and now formed the bulk of

the opposition, nevertheless losing perhaps as many pro-slavery Whigs as they gained anti-slavery Democrats. The real and effective gain, therefore, was the more or less thorough alliance of the Whig party and the Free-soil party of the Northern States: wherever that was successful it gave immediate and available majorities to the opposition, which made their influence felt even in the very opening of the popular contest following the congressional repeal.

It happened that this was a year for electing congressmen. The Nebraska bill did not pass till the end of May, and the political excitement was at once transferred from Washington to every district of the whole country. It may be said with truth that the year 1854 formed one continuous and solid political campaign from January to November, rising in interest and earnestness from first to last, and engaging in the discussion more fully than had ever occurred in previous American history all classes and constituent elements of our whole population.

In the Southern States the great majority of people welcomed, supported, and defended the repeal of the Missouri Compromise, it being consonant with their pro-slavery feelings, and apparently favorable to their pro-slavery interests. The Democratic party in the South, controlling a majority of slave States, was of course a unit in its favor. The Whig party, however, having carried two slave States for Scott in 1852, and holding a strong minority in the remainder, was not so unanimous. Seven Southern Representatives and two Southern Senators had voted against the Nebraska bill, and many individual voters condemned it as an act of bad faith—as the abandonment of the accepted “finality,” and as the provocation of a dangerous antislavery reaction. But public opinion in that part of the Union was fearfully tyrannical and intolerant; and opposition dared only to manifest itself to Democratic party organization—not to these Democratic party measures. The Whigs of the South were therefore precipitately driven to division. Those of extreme pro-slavery views, like Dixon of Kentucky,—who, when he introduced his amendment, declared, “Upon the question of slavery I know no Whiggery and no Democracy,”—went boldly and at once over into the Democratic camp, while those who retained their traditional party name and flag were sundered from their ancient allies in the Northern States by the impossibility of taking up the latter’s antislavery war-cry.

At this juncture the political situation was further complicated by the sudden rise of an entirely new factor in politics, the American party, popularly called the “Know-Nothings.”

Essentially, it was a revival of the extinct “Native-American” faction of 1835–7, based upon a jealousy of and discrimination against foreign-born voters, desiring an extension of their period of naturalization, and their exclusion from the franchise of office; also upon a certain hostility to the Roman Catholic religion. It had been reorganized as a secret order in the year 1853; and seizing upon the political disappointments following General Scott’s overwhelming defeat for the presidency in 1852, and profiting by the disintegration caused by the Nebraska bill, it rapidly gained recruits both North and South. Operating and organizing in entire secrecy, the country was startled by the sudden appearance in one locality after another, on election day, of a potent and unsuspected political power, which in many instances pushed both the old organizations not only to disastrous but even to ridiculous defeat. Both North and South its forces were recruited mainly from the Whig party, though malcontents from all quarters rushed to group themselves upon its narrow platform, and to participate in the exciting but delusive triumphs of its temporary and local ascendancy.

When, in the opening of the anti-Nebraska contest, the Free-soil leaders undertook the formation of a new party to supersede the old, they had, because of their generally democratic antecedents, with great unanimity proposed that it be called the “Republican” party, thus reviving the distinctive appellation by which the followers of Jefferson were known in the early days of the republic. Considering the fact that Jefferson had originated the policy of slavery restriction in his draft of the ordinance of 1784, the name became singularly appropriate, and wherever the Free-soilers succeeded in forming a coalition it was adopted without question. But the refusal of the Whigs in many States to surrender their name and organization, and more especially the abrupt appearance of the Know-Nothings on the field of parties, retarded the general coalition between the Whigs and the Free-soilers which so many influences favored. As it turned out, a great variety of party names were retained or adopted in the congressional and State campaigns of 1854, the designation of “anti-Nebraska” being perhaps the most common, and certainly for the moment the most serviceable, since denunciation of the Nebraska bill was the one all-pervading bond of sympathy and agreement among men who differed very widely on almost all other political topics. This affiliation, however, was confined exclusively to the free States. In the slave States, the opposition to the administration dared not raise the anti-Nebraska banner, nor

could it have found followers; and it was not only inclined but forced to make its battle either under the old name of Whigs, or, as became more popular, under the new appellation of "Americans," which grew into a more dignified synonym for Know-Nothings.

Thus confronted, the Nebraska and anti-Nebraska factions, or, more philosophically speaking, the pro-slavery and antislavery sentiment of the several American States, battled for political supremacy with a zeal and determination only manifested on occasions of deep and vital concern to the welfare of the republic. However languidly certain elements of American society may perform what they deem the drudgery of politics, they no longer shrink from it when they hear warning of real danger. The alarm of the nation by the repeal of the Missouri Compromise was serious and startling. All ranks and occupations therefore joined with a new energy in the contest it provoked. Particularly was the religious sentiment of the North profoundly moved by the moral question involved. Perhaps for the first time in our modern politics, the pulpit vied with the press, and the Church with the campaign club, in the work of debate and propaganda.

The very inception of the struggle had provoked bitter words. Before the third Nebraska bill had yet been introduced into the Senate, the then little band of "Independent Democrats" in Congress — Chase, Sumner, Giddings, and three others — had issued a newspaper address calling the repeal "a gross violation of a sacred pledge"; "a criminal betrayal of precious rights"; "an atrocious plot," "designed to cover up from public reprehension meditated bad faith," etc. Douglas, seizing only too gladly the pretext to use denunciation instead of argument, replied in his opening speech, in turn stigmatizing them as "abolition confederates" "assembled in secret conclave" "on the holy sabbath while other Senators were engaged in divine worship" — "plotting," "in the name of holy religion"; "perverting," and "calumniating the committee"; "appealing with a smiling face to his courtesy to get time to circulate their document before its infamy could be exposed," etc.* The key-notes of the discussion thus given were well sustained on both sides, and crimination and recrimination increased with the heat and intensity of the campaign. The gradual disruption of parties, and the new and radical attitudes assumed by men of independent thought, gave ample occasion to indulge in such epithets as "apostates," "renegades," and "traitors." Unusual acrimony grew out of the zeal of the Church and its ministers.

* Sheahan's "Life of Douglas," p. 194.

The clergymen of the Northern States not only spoke against the repeal from their pulpits, but forwarded energetic petitions against it to Congress, three thousand and fifty clergymen of New England of different denominations joining their signatures in one protest. "We protest against it," they said, "as a great moral wrong, as a breach of faith eminently unjust to the moral principles of the community, and subversive of all confidence in national engagements; as a measure full of danger to the peace and even the existence of our beloved Union, and exposing us to the righteous judgment of the Almighty."† In return, Douglas made a most virulent onslaught on their political action. "Here we find," he retorted, "that a large body of preachers, perhaps three thousand, following the lead of a circular which was issued by the abolition confederates in this body, calculated to deceive and mislead the public, have here come forward with an atrocious falsehood, and an atrocious calumny against this Senate, desecrated the pulpit, and prostituted the sacred desk to the miserable and corrupting influence of party politics." All his newspapers and partisans throughout the country caught the style and spirit of his warfare, and boldly denied the moral right of the clergy to take part in politics otherwise than by a silent vote. But they, on the other hand, persisted all the more earnestly in justifying their interference in moral questions wherever they appeared, and were clearly sustained by the public opinion of the North.

Though the repeal was forced through Congress under party pressure, and by the sheer weight of a large Democratic majority in both branches, it met from the very first a decided and unmistakable popular condemnation in the free States. While the measure was yet under discussion in the House in March, New Hampshire led off by an election completely obliterating the eighty-nine Democratic majority in her Legislature. Connecticut followed in her footsteps early in April. Long before November it was evident that the political revolution among the people of the North was thorough, and that election day was anxiously awaited merely to record the popular verdict long since decided.

The influence of this result upon parties, old and new, is perhaps best illustrated in the organization of the Thirty-fourth Congress, chosen at these elections during the year 1854, which witnessed the repeal of the Missouri Compromise. Each Congress, in ordinary course, meets for the first time about one year after its members are elected by the people, and the influence of politics during the interim needs always to be taken into account.

† *Globe*, March 14, 1854, p. 617.

In this particular instance this effect had, if anything, been slightly reactionary, and the great contest for the Speakership during the winter of 1855-6 may therefore be taken as a fair manifestation of the spirit of politics in 1854.

The strength of the preceding House of Representatives, which met in December, 1853, had been: Whigs, 71; Free-soilers, 4; Democrats, 159—a clear Democratic majority of 84.* In the new Congress there were in the House, as nearly as the classification could be made, about 108 anti-Nebraska members, nearly 40 Know-Nothings, and about 75 Democrats; the remaining members were undecided.† The proud Democratic majority of the Pierce election was therefore annihilated.

But as yet the new party was merely inchoate, its elements distrustful, jealous, and discordant; the feuds and battles of a quarter of a century were not easily forgotten or buried. The Democratic members, boldly nominating Mr. Richardson, the House leader on the Nebraska bill, as their candidate for Speaker, made a

long and determined push for success. But his highest range of votes was about 74 to 76; while through 121 ballotings, having continued from December 3d to January 23d, the opposition remained divided, Mr. Banks, the anti-Nebraska favorite, running at one time up to 106—within seven votes of an election. At this point, Richardson, finding it a hopeless struggle, withdrew his name as a candidate, and the Democratic strength was transferred to another, but with no better prospects. Finally, seeing no chance of otherwise terminating the contest, the House yielded to the inevitable domination of the slavery question, and resolved, on February 2d, by a vote of 113 to 104, to elect under the plurality rule after the next three ballotings. Under this rule, notwithstanding the most strenuous efforts to rescind it, Nathaniel P. Banks of Massachusetts was chosen Speaker by 103 votes, against 100 votes for William Aiken of South Carolina, with 30 scattering. The “ruthless” repeal of the Missouri Compromise had effectually broken the legislative power of the Democratic party.

IN THE LANE.

AND art thou then, my heart, too old
Ever to leap with love again,
To feel the strong blood-torrent rolled
Through heaving breast and teeming brain?
Is it no more, my heart, for thee
Life's one unquestioned ecstasy?

Are faded quite those dim, far days
When music mothered every sound,
When up and down youth's happy ways
Fared glories on eternal round?
Has chill of years killed every joy
That blossomed for the wandering boy?

These are the trees once known so well
We felt to them all but beknown;
Their very shadow we could tell
From others by the forest thrown.
The same glad songs from bush and bough—
As once we heard, we hear them now.

And these sweet flowers beneath my feet,
Their young eyes greet us as of yore.
The hope, there! Still they think to meet
Her glance that shall not answer more:
To us alone it cannot be
They're looking up so tenderly.

This is the same gray path we took
Behind the slowly going day;
As they do now, the light leaves shook
When evening breezes blew this way;
And there's the glow upon the dome,
And here the cows are coming home.

Ah, no, good heart, thou still canst stir,
Still lives the love first bid thee leap:
Still are we at the side of her
They laid away 'neath yonder steep.
Though clods be on her and a stone,
In the dear old lane we're not alone.

John Vance Cheney.

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null,"
"The Casting Away of Mrs. Lecks and Mrs. Aleshine," etc.

XII.

ON the day of Mr. Stratford's arrival in the city, and very soon after he had parted from Enoch Bullripple, the latter received a letter from his nephew, John People.

It was a long letter, and full of indignation and reproach. In the strongest terms which John's sense of duty would allow him to use towards a respected relative, he protested against the injustice and injury which had been done him by the unwarrantable trick played upon him by his uncle. Mr. Bullripple's letter had assured him that it was all intended for his good, but this declaration made no impression on John. He had been ruthlessly forced to break his faith with his employer, and to desert and neglect the interests which had been intrusted to him. Nothing on earth could have tempted him voluntarily to do what he had been tricked into doing. Instead of this enforced absence being a benefit to him, he felt sure it would work him an injury. He had written to his employer explaining the whole affair, but he had no reason to believe that his explanations would clear him from condemnation by that person; and disaster, both to his fortune and to the business, must certainly result from his uncle's deplorable action.

John further stated that, instead of writing, he would have hastened home himself, but that he had no money by which to come by rail, and that the steamer on which he had a return ticket would not start North for several days. He had written for money to be telegraphed to him, and would be in the city at the earliest possible moment.

When Mr. Bullripple had read this letter his countenance was not that of a man whose conscience had been touched by the reproaches of one he had wronged. On the contrary, he allowed himself a smile of much content as he folded the letter and slipped it into an inner pocket of his coat.

"Written to the boss, has he?" he said to himself. "That's all right; and now we'll wait and see what happens next. If the boss can

stand that punch without comin' out of his hole and showin' himself, he's got more grit than anybody I've met yit on this planet."

The fact that John had not been able immediately to set out on his return to the city was a comfort and relief to the soul of Mr. Bullripple, for he had found that the task of ferreting out the concealed proprietor of Vatoldi's was more difficult than he had expected it to be, and for the past day or two he had feared that his nephew might make his appearance and prevent the successful working out of his plans. But now there was some time yet in which, with his perceptive faculties keener than ever, he could keep a bright lookout for the other man to whom John had written.

When Mr. Stull received his letter it was a happy thing for him that he was alone, for he fairly roared with fury. He had thought that his detestation of Enoch Bullripple could not be greater than it had become during the time that the old man had had sole charge of Vatoldi's; but now Mr. Stull found that he had been mistaken. Nothing that Bullripple had done could compare with this act of demoniacal villainy. If ever a man had been revenged on another, he would be revenged on this old farmer. It was not necessary for him to show himself, nor to do anything at the present moment. It would not be long before John People would return, and then he could act, as before, unseen and unknown. The first thing he would do would be to order his manager immediately to send his uncle and his mother to their home in the country; and then Mr. Stull determined to devote all the energy of his intellect to schemes by which that reprobate of a Bullripple should be made to suffer for his sins, without knowing who caused him his pangs and his agony. There were weak places in Mr. Bullripple's affairs which Stull knew, and it was at these spots he intended to strike until he had reached the very heart of his victim.

During the rest of that day, and a great part of the night, the mind of Mr. Stull was almost entirely given over to schemes for the ruin of the man who in such scoundrelly fashion had thrust himself into his path.

The next day he lunched at Vatoldi's, as was his custom. No matter what happened,

he said to himself, he would make no change in his ordinary habits, and give no one reason to suppose that what was occurring there was of the slightest concern to him.

But the difficulty of restraining himself to his prescribed line of action was now greater than he ever imagined it could be. To look at Enoch Bullripple without hurling knives, forks, and imprecations at him induced a strain which few minds except that of J. Weatherby Stull could have withstood. He ate with assumed appetite the meal which he had ordered, and no knives, forks, or imprecations flew through the air. But his soul writhed, groaned, and gritted its teeth within him, and he longed for the coming of John People, and the beginning of his vengeance. Not only the uncle, but the nephew, should suffer. He had to be very careful in his treatment of the only person who held his secret, but he would not allow himself to forget that John had been weak and foolish enough to be led away by a most flimsy trick from his post of duty at a time when it was so necessary that he should be there. Mr. Stull had not yet determined how John should be punished, but that this punishment should take place he most solemnly promised himself.

Mr. Stull was a man who, if he had anything to do, liked to go to work and do it as soon as possible; and the very next morning he set on foot some particular inquiries in regard to the tenure by which Enoch held his farm. He thought that said tenure probably resembled that by which he held his own farm; and, if this should prove to be the case, he had conceived a plan by which the meddling old man could be brought to a just punishment, and that, too, without knowing who had brought it upon him.

He ate his luncheon at Vatoldi's that day with a good appetite, for the prospect of making himself even with old Enoch, and the knowledge that John would very soon return, had restored his mental and physical systems to something of their ordinary condition. His indignation against Enoch received, however, fresh fuel to-day. New placards had been hung upon the wall, one announcing that certain puddings would be furnished with "Boycotter Sauce"; and the general vulgarity and low tone of the place seemed to be on the increase. Before the receipt of John People's letter Mr. Stull had believed old Bullripple to be a stupid blunderer, who, knowing nothing of the business he had undertaken, had done everything in the way it should not be done; but now he believed him to be a designing rascal, who, hating anything better than that to which he was accustomed, was taking a vicious delight in pulling Vatoldi's down to his own level, for nothing but the depraved love of power, and

the desire to make the restaurant what his groveling soul thought it ought to be, could have induced the old man to take so much trouble to get his nephew out of the way.

Shortly before three o'clock that afternoon Mr. Stull was astounded, almost paralyzed, in fact, by beholding the entrance, unheralded by announcement or knock, of Enoch Bullripple into his private room at the bank. His astonishment was instantly succeeded by an influx of savage fury at this intrusion, and rising to his feet, he was about to launch his indignation against the old man, but Enoch spoke first. Holding out a large wallet stuffed with bank notes, the exuberance of which was restrained by a piece of twine, he said:

"I want to know, Mr. Stull, what I'm to do with this money? There hain't been none deposited in the bank since John went away, and there's a good deal more of it now than ought to be kep' in that little safe under the desk. Now I don't know whether I'm to deposit it in John's name, or in your name. You know I haven't got no account at this bank."

Mr. Stull sat down. His face was gray, his eyes were wide open. Mr. Bullripple took a chair on the opposite side of the table, on which he laid his wallet.

"Sick?" said he, looking over at the other.

Stull's face now began to work. "What do you — what do you mean," he stammered, "by bringing that to *me*?" And he made a faint motion as if he would push the wallet from the table.

Enoch leaned back in his chair, half closed his eyes, and grinned. "It appears to me," he said, "that the man that owns a lot of money is the best person to ask what's got to be done with it. Game's up, Jonathan Stull," he added. "'Tain't no more use keepin' in your hole; you might jus' as well walk right out and show yourself."

Dumb, gray, and open-eyed, Mr. Stull still stared at the old man. One thought only filled his mind: that arch-fiend on the other side of the table possessed his secret. When John People was his only confidant Mr. Stull had felt safe and satisfied. The incalculable importance of secrecy had been made known to John. The young man was honest and faithful, and he would as soon have thought of stealing his employer's money as of betraying his sacred confidence.

But now the secret was known to a black-hearted wretch. Mr. Stull said nothing, because no words would come to him; but it was unnecessary to say anything. No questioning was needed to make him see plainer than he saw now that Enoch Bullripple knew that he was the owner of Vatoldi's.

The old man had no intention of forcing

his victim to express himself, nor of prolonging the interview merely to enjoy his triumph, and he proceeded at once to business. "Now, Jonathan Stull," he said, leaning forward on the table, "you and me has got somethin' to talk about, and the sooner we git at it the better. You're a good deal took back, I can see, and don't appear to be ready to be very glib with your words. But that ain't needed. All you've got to do jus' now is to listen; and when I'm through, and you've come a little to your senses, you can tell me what you've made up your mind to do."

It may be here remarked that not for one moment did Mr. Stull suspect that John had betrayed him to Bullripple. The tone of the young man's letter to him, and the fact that his uncle found it necessary to get rid of him, made it plain to Mr. Stull that John's integrity had not been shaken. He knew, as well as if he had been told, that in some way he had betrayed himself to that sharp-eyed old wolf who was now glaring at him. A tidal wave of rage came rolling back upon him. It was necessary to restrain himself, but he could look upon Enoch only as a venomous creature from whom it was difficult to withhold a blow.

"Be quick," he said savagely. "What do you want? Is it that?" And he pointed to the wallet.

Enoch struck the table with his fist. He, too, was roused, but he felt under no restraint. "Get out with you!" he said. "What do you suppose I want with your pancake and molasses money? But I'll let you know what I do want—and in short order too. It's not been very long since I've found out that the person who was working my nephew John by day and by night, and givin' him mighty little for it and no show for himself, was a mean sneak, who, for some reason or other, was afraid to show his face, even when his own business was goin' to rack and ruin; and ever sence this was made clear and plain to me, I've jus' given myself up to the business of rooting out that feller, and have left my farm to be took charge of by a hired man; and how much I've lost I don't know, nor I don't keer, for I've got him out. He's settin' right here in front of me. By George!" the old man exclaimed, while an enormous grin elevated his wrinkled cheeks, "you must 'a' been tored up wuss than a sas-safras field that's bein' grubbed and plowed when you seed me turnin' your eatin' house upside down, and a-doin' everythin' I knowed was agin the creed and catechism of whoever it was who owned the place. It took a good deal longer to fetch that rat out than I thought it would, fur he had more grit than I give him credit fur. But I did it. By George! I did it. When I got John's letter, and he said he'd

wrote to the owner, I says to myself, 'That feller's bound to show up now, if ever he does.' And, sure enough, he did. I'd had my eye on you for a good while, though there was times when I thought you couldn't be fool enough to let me rip and stave jus' as I pleased, without ever liftin' your finger or sayin' a word. But from what I'd had to do with you afore, I knowed you was the man to do anythin' mean and sneakin' if it was called fur; and your comin' there so constant made me suspicion you. It wasn't like you to be eatin' every day in a place like that if there wasn't a better reason for it than what you said about your allus bein' in the habit of comin'. And yesterday, when you got John's letter, you came in a-glarin' like a two-eyed locomotive, and I could 'a' swore before an alderman you was the man. But I wasn't quite ready to come out on you, fur I hadn't got my accounts all squared up. But I was glad I waited, for the way you looked at me this day while you was eatin' made the thing as sure as if *you'd* gone before an alderman and swore it. And here I am; and there's the money on hand, up to two o'clock to-day; and inside the wallet is a statement of all I've took in and all I've spent. And now I'll come to the p'int. If you've got any reason fur keepin' yourself hid and out of sight, that's your affair, and not mine. But if you want me to keep mum about it, you've got to come to my terms, and them's these: John must be took into the business, and have a decent share of the profits; and he's not to be kep' slavin' at it neither, but he's to have help enough so's he can git off now and then, like other people. I've made up my mind that he's to have a clean two weeks to begin with, to come down into the country to see his mother and me. That trip down South ain't to be counted in at all. He didn't git no pleasure out of it, and it jus' went in in the way of business. What in the name of common sense made him stick to you as he has stuck is more than I can tell. It's out and out beyond me. But he's got to be paid for it now. As soon as he comes home I'm goin' to set the whole thing fair and square before him, and I'll see to it that you and him makes out the right kind of a contract. Now, then, Jonathan Stull, you see what's before you. And if you back out, and say you are not the owner of Vatoldi's—well, then, by George! John and me will keep the place and run it ourselves until the real owner turns up. Now, then, there's the money; and what have you got to say?"

Into the gloomy ferocity of Mr. Stull's soul there entered a gleam of satisfaction. The scheme of the old man was not one of simple malicious vengeance. He wanted something.

He desired to make a bargain. This showed a way out of the difficulty. The bargain could be entered into, and everything go on as before; and Mr. Stull had confidence enough in his own ability to feel sure that he could carry out the plan of vengeance he had devised. He did not strongly object to giving John a moderate share in the business. On some accounts it might be a very wise thing to do. But, whatever arrangement might be made, and whatever good might come of it, he would never forgive the wretched old scoundrel who had ferreted out his secret and forced himself into his affairs.

He stood up suddenly, almost overturning his chair as he did so. Seizing the bulging wallet with one hand, he waved the other toward the door. "Now you can go!" he snarled to Enoch.

Mr. Bullripple did not immediately move. "I'll go when I'm ready," he said. "And, as I've nothin' more to say, I'll go now. And you see to it, Jonathan Stull, when I come to you about that contract, that you're ready to make it."

Thereupon he slowly rose and went out. He knew his man would be ready.

The next evening Mr. Bullripple called upon Mr. Stratford at his city apartments to inform that gentleman that he and Mrs. People would return next morning to the farm-house, where they would be glad to welcome their friend and lodger as soon as he chose to return, and to make him as comfortable as he had been accustomed to be in their house.

"We've been away a good deal longer than we expected," said Enoch, "and I hope you didn't feel yourself druv to come to town."

"Not at all," said Mr. Stratford. "I should have come to the city in any case. But how have you succeeded in the complicated scheme of which you told me the other day? And are you ready to show me my hundredth man?"

"Oh, I've got him! I've got him!" cried Enoch, his eyes sparkling. "But the mischief of it is, I can't show him to you. It would just tickle me to death if I could p'int him out, but things is fixed so it can't be done."

"I suppose, from what you told me the other day," said Stratford, "that you have discovered the owner of Vatoldi's."

"That's the feller!" cried Enoch. "And, by George! he squealed when I made him come out of his hole. But out he came, and I fixed it all right with him. And I tell you, Mr. Stratford, if I could take you where that man is, and p'int him out, and let you know what he's done and what he didn't do, you'd say, 'Enoch Bullripple, that's my hundredth man, and I needn't look no further.'"

Mr. Stratford laughed. "And yet you can't show him?" said he.

"No, sir," said Enoch. "I've agreed to let him go back in his hole, and have promised not to rout him out no more so long as he sticks to what he says he'll do. But I've made a pretty good thing of it for John. He's to have a share in the business, and has got to be treated more like a man and less like a plow-horse."

"Did John agree to your stepping in in this way," inquired Stratford, "and arranging his affairs for him in this extraordinary fashion?"

"He couldn't do nothin' else but agree to it," said Enoch. "I got my thumb on both of 'em, and if either of 'em had skipped from under, all I had to do was to wash my hands of the whole business, and to tell you and everybody else what I'd found out; and that would 'a' knocked the eatin' house proprietor higher'n a kite. And John knowed it. He was as mad as hops when he got back last night, but that didn't hurt nobody; and this afternoon he and the other feller jus' walked up to the scratch, and the contract between 'em was signed and sealed. And that's why me and Mrs. People is goin' home, havin' no more to do here, and lots to do there. And I hope it won't be long before you'll be comin' too."

"You'll see me in a day or two," said Stratford; "and it strikes me that you needn't trouble yourself about not being able to show me the hundredth man. I am not sure about it, but I expect I can put my finger upon him before very long."

"Now look here, Mr. Stratford," said Enoch, a little anxiously; "if you do find him, I hope it won't be on account of anythin' I've said. I've promised to keep him shady, and I'm not a man to go back on my word."

"Be perfectly easy on that point," said Mr. Stratford. "I am not thinking of the owner of Vatoldi's, and I have no desire to seek him out."

"You wouldn't be likely to find him, if you tried," said Enoch, rising to depart; "and I can't help you. And as it's my opinion there ain't no other one like him, I advise you to give up the search for your hundredth man."

XIII.

SHORTLY after Mr. Stratford's arrival in the city he was called upon by his friend Arthur Thorne, who had a grievance.

"Do you know," said Thorne, "that you got me into a pretty scrape up there at Cherry Bridge?"

"How so?" asked Stratford.

"By not telling me that Miss Armatt was engaged. When you told me that you were not her lover, I made up my mind that as I am her lover, I would win her if I could. I never supposed that any one else was in the way. I wrote

to Mrs. Justin asking permission to go there and push my suit, and I've had a letter from her telling me that for more than a year the young lady has been engaged to be married. Now, what a position is this for me to place myself in? Why didn't you tell me that she was engaged?"

"Because I do not approve of the engagement," said Stratford, "and think it well to say as little of it as possible."

Mr. Thorne gazed at his friend in amazement. "What in the name of common sense," he asked, "have you to do with it? And what matters it whether you approve of it or not? She is not related to you?"

"Not in any way," said Stratford. "But I wished to be a good friend to her, and, at least, intend to try to be. And now let me tell you how things stand." Thereupon Stratford proceeded to speak of Gay Armatt. He told his friend what sort of girl she was, what her career had been, what her aspirations were, and what her future ought to be. He told how she had been engaged, while yet a student, and a very girl in all social matters, to a man whose marriage with her would degrade her, put an end to her mental development, and make only a hard-worked housekeeper of one who now had everything to hope for that was open to a woman. He proceeded to say that he believed that the girl should be saved from such a fate; and that, as there was no one else to do it, he intended to save her himself, if possible. And then he detailed his plans regarding Miss Armatt.

"By which you mean," cried Arthur, when he had finished, "that you intend to break off this engagement, and then marry her yourself."

Stratford shook his head. "I shall do nothing of the kind. If the engagement comes to an end, as I hope it may, I shall greatly desire that Miss Armatt shall marry some man worthy of her; and all that I shall do will be to endeavor to carry her over the gap between the present engagement and one which shall be suitable."

"Monstrous!" cried Arthur. "You might as well try to break up a marriage because you think the man and his wife are not suited to each other; and I am surprised to hear you speak as you have done about a wife's position as mistress of her house. There is no nobler place for a woman. I have no doubt Miss Armatt looks forward with most joyous anticipations to those household duties and pleasures which you have decided that she ought not to have."

"You do not grasp the situation," said Stratford. "I know exactly what Miss Armatt looks forward to. She expects to be mistress of a household, and to be happy in that position. Her hopes in this direction are vague and ill-defined, while her views in regard to her future intellectual life are as clear and definite as those

of any brain-worker who ever lived. But she does not know, as I do, that her marriage with Crisman will totally wreck this intellectual life, and make her a disappointed and unhappy woman."

Thorne arose suddenly, and began to walk up and down the room. "It angers me," he said, "to hear you talk in this way. How on earth do you know what her life will be? Is she not a rational being, able to plan out such things for herself?"

"She is not as able to do it as I am," said Stratford; "for she does not know Crisman as I know him."

For answer Mr. Thorne snapped his fingers, and then laughed derisively. "I speak mildly," he said, "when I call this a most unusual way of getting a wife. It is courtship after the eagle and fish-hawk fashion."

"I tell you," said Stratford, turning sharply upon him, "that I have no intention of making love to or of marrying Miss Armatt."

"Do you mean to say," asked Thorne, stopping in his restless walk, "that if you succeed in convincing this girl that there are much better men in the world than the man she is engaged to, and a much better kind of love than the love which exists between him and her, and that there is for her a happiness which is far greater than anything she could expect if she married Crisman, and in this way break off the match — do you mean to say, I ask, that you would then be willing for another man to step in, myself, for instance, and try to win her?"

"Entirely willing," said Stratford. "Nothing would please me better than to see her married to you."

Thorne burst out into a loud, contemptuous laugh, and taking up his hat, he walked away without a word. Never since he had been a man had he been guilty of such a breach of good manners.

Stratford was left with his temper somewhat aroused, but it soon cooled down. He was discovering that he could not expect sympathy in the task he had undertaken.

Arthur Thorne did not so soon cool down. It was not very easy to warm him up; but when he became heated, the reduction of his mental temperature was generally a slow process. He was angry with Stratford. He had persuaded himself, since the receipt of the letter from Mrs. Justin, that, as an honorable man, he had given up, absolutely and utterly, all amatory ideas in regard to Miss Armatt. She belonged to another person, and he had no right even to think of her in that sort of way. It was very hard for him to do this, for the girl had made an impression on him such as he had never received before. He believed that it was his duty to marry, and he wanted to marry;

and when he was living in the house with Miss Armatt, and his friend Stratford had told him that he had no matrimonial intentions toward her, it had come to him much more forcibly than things usually came to him, that here was the woman out of all the world whom he would like to make his wife. But he believed he had been torn from every thought of this kind, and had gone to Stratford merely with the intention of mildly upbraiding him for having allowed him to put himself in a false position.

But now, as has been said, he was very angry with his friend, and the more he thought of it, the more he thought he perceived a very strong element of jealousy in this anger. But why should he have feelings of jealousy in regard to Miss Armatt? He had no right to such feelings, and could have none. It was a vile and wretched state of affairs, and Stratford had led him into it. Therefore was he angry.

It was on a Tuesday morning, and several days after Mr. Stratford had concluded the business which brought him to town, that Miss Gay Armatt sat on the porch of the Cherry Bridge house writing a letter. The paper lay upon a portfolio on her lap, and on the floor by her side stood her little traveling inkstand with its two tops open at angles which invited upset on the slightest provocation. She was writing very slowly, stopping often to think what she should say. She wished to be very careful to make this letter exactly what it ought to be, for it was to go to Mr. Stratford, and it was the first one she had ever written to him. Her work, although slow, did not seem to be irksome to her; on the contrary, she appeared very much interested in it. Whenever she held her pen motionless, raised a little above the paper, and gazed up into the trees or the vines about her, there came into her eyes a brightness, and on her cheeks a faint deepening of their warmer tones, which made those eyes and cheeks more charming than in ordinary times, while her lips moved as though she might smile or speak or even hum a tune before she began to write again. On the tulip poplar near by, there sat a little bird which looked very like the bird to which, not long ago, she had told the secret of her birthday. If it had been truly the same bird, it would have been easy to imagine that his little breast was filled with wonder that that young creature sitting down there, in the shade, and in the fragrance of the honeysuckle vines, writing a letter on her knee, could be really twenty-one years old, and a very woman.

If the little bird could have looked into her brain, he would have seen that it was stored with the result of years of study and conscientious intellectual work; and if he could have looked into her heart, he would have seen that

it was filled with impulses and emotions which were truly womanly. But could he have known her cheerful, half-blown notions about men, women, and the world, and could he have understood that joyousness of disposition which sprang from lovers' words, or woodbine scents, or clusters of wild strawberries, he might have said to himself that many a wiser bird than he would think that this young creature, writing a letter in the shade of the vines, was mistaken in supposing that she was no longer a girl.

Gay had heard only the evening before that Mr. Stratford had returned to the Cherry Bridge neighborhood; and as she had something to say to him, she thought it her duty to write without loss of time: and that it was a duty she did not in the least shrink from might easily have been perceived by any human being or bird capable of making deductions of this kind. Mr. Crisman had been with her on the previous Sunday; and she had noticed, or had thought she noticed, that he was a little, a very little, wearied by what he called the monotony of the country. Now she was very desirous that he should not become wearied by Cherry Bridge. This was a region which could never be monotonous to her, but she could easily see that it might be so to Charley. He spent no whole day there except Sunday, and there was so little a person of his tastes could do in this part of the country on Sunday. He was fond of fishing, but he arrived too late on Saturday afternoons for any diversion of that sort; and, besides, he had told her that he did not like to go wandering about by himself with a fishing rod. If there were pleasant fellows along, that was another thing, but solitary fishing was too lonesome a business for him. He might sometime stay over Monday for a day's fishing; but as there was no one to go with him, there was no use talking about it. Gay offered to go with him herself; but he laughed at her in a very good-humored and superior way, and told her that if he ever found a stream where the fish were too plentiful and needed to be frightened and made gamy, he would take her along. She assured him that Mr. Stratford told her that she could, in time, learn to fish very well; but at this Crisman laughed again, and said that Stratford probably did not know women as well as he did. When it came to a real day's fishing, he thought that Mistress Gay would be much better pleased in a hammock on the lawn, with a novel and a box of caramels.

Gay did not dispute this point, for she knew that Charley was not fond of having his propositions controverted, and she herself took no pleasure in arguments; but she said she did not doubt that Mr. Stratford would go fishing with him, and he could have no better companion, for that gentleman knew the country

so well he could take him where the best fishing was to be found. This proposal suited Mr. Crisman very well. If Stratford would go with him, he would make his arrangements to stay up some Monday, and have a long day's tramp among the trout streams. Gay said she would ask Mr. Stratford about it as soon as he came back; and when she heard of his return, she did not wait until he should call on them, but set herself to work to write him a letter.

The letter, when finished, was a very good one, and explained the situation in a satisfactory manner. Gay gave it to Mrs. Justin to read, who was surprised when told it had been written, but who, on reading it, could find nothing in it to which reasonable objection could be made. On general principles she objected to Gay's writing to Mr. Stratford on any subject, or in any manner whatever. But as this was really Mr. Crisman's affair, and as he had desired that Gay should write the letter, Mrs. Justin of course had no right to interfere. She read the neatly written pages a second time, but she could discover nothing in them which would lead the recipient to suppose that the writer thought of aught else but that her lover should have a pleasant day's fishing, with an agreeable companion and competent guide.

Gay was anxious that her epistle should be dispatched as soon as possible, because, if Mr. Stratford would go fishing on the following Monday, she wanted to write immediately and let Mr. Crisman know. Mrs. Justin said she was going to send a man to the village, and that he could ride on and take the letter to Mr. Stratford. Gay went back to the porch to put it into an envelope and address it, and when she was pressing it down on her portfolio while sealing it, a thought came into her head. Taking up her pen, she wrote on the back of the envelope: "Are you *ever* coming to see us again?" When the man came she gave him the note, and he rode away.

At luncheon time the returning messenger brought back an answer. Mr. Stratford wrote that he would be much pleased to accompany Mr. Crisman on a fishing excursion on the day proposed, and he felt under obligations to Miss Armatt for giving him this opportunity of serving her friend. It was a very pleasant note, and a very polite one; but when Gay had read it through, there was a shade of disappointment on her face.

"He doesn't say a word," she exclaimed, "about coming to see us!"

Mrs. Justin was a little surprised that Gay should expect any such word, and she remarked that probably Mr. Stratford did not think it necessary to announce any intention of that kind.

The fishing expedition came off the following Monday; and in order to stay out of town for

that day, Mr. Crisman came to Cherry Bridge on Sunday, instead of Saturday, as was his custom. This made his visit to Gay a comparatively short one; but as she was easily brought to see that putting on time to one end of his visit made it necessary to take off some from the other, she did not complain.

Mr. Stratford's motives in agreeing to the proposal for a day's fishing were of varied kinds. He had no particular desire to gratify the piscatorial propensities of Mr. Crisman, but he was more than willing to do anything which should be asked of him by Miss Armatt. But his principal object in consenting to be Mr. Crisman's companion for a whole day was to give that young man an opportunity of changing the opinion which he had formed of him. "It may be," Stratford had said to himself, "that I am mistaken in my estimate of the man. There may be qualities in him which will counterbalance those to which I so greatly object. At present he is very decidedly commonplace and vulgar; but his nature may be weaker than I take it to be, and he may be susceptible to the impressions which Gay would make upon almost any one, and thereby be drawn under her influence. If there is a possibility of anything of that kind, the marriage may be well enough. There is no reason to suppose that she could elevate him very much, but she might raise him high enough to enter with some sort of sympathy into her pursuits and purposes. He must always be a drag upon her, but he might not be able to pull her down. And, again, he may have points which are so good in themselves as to overbalance some of the bad ones I have noticed in him. If that be the case, I will let Mrs. Justin and Thorne have their way. If there is anything good in the man, it is bound to come out in the course of a day's tramp."

Stratford was perfectly honest in his intentions towards his companion. He did not like Crisman, and would have been sorry, under any circumstances, to see him married to Gay, whose nature was of an entirely different order from that of her lover. But if there was any reason to believe that the marriage would not prove the wreck and ruin of which he thought so much and spoke so frequently, then he would consider it his duty not to interfere with the course events were taking. He did not intend during this day with Crisman to be a spy upon him; in fact, he made up his mind to avoid saying or doing anything which would be calculated to bring into view the bad points of the young man: he had seen enough of them, and desired to know no more concerning them. What he would make it his business to discover was the good that might be in Crisman.

The day was an admirable one for trout fish-

ing. The sky was slightly overspread by clouds; there was breeze enough, and none too much; and if Crisman had been a fellow inclined to grumble, which he was not, he would have found no reason for discontent this day. He had not known before what an agreeable and talkative companion Stratford could be, and what a generous fellow too, as was shown by his constantly surrendering favorable fishing opportunities to the younger man. There was another thing which Crisman very much liked in Stratford: he obtruded no advice. Crisman had not had very much practice with the rod and fly, and his only mental objection, when Gay proposed this expedition, was founded on the fear that Stratford, whom he knew to be a skillful angler, would be continually telling him what he ought to do. Stratford had too much good feeling, as well as tact, for this. He knew that the young man had come out for a day's fishing, and not a day's teaching; and he felt quite sure, too, that Crisman was not the man to submit to the presumption that teaching was necessary. So they got on capitally together, each fishing in his own way, and Crisman catching a good many trout, and rejoicing a great deal in his fortune.

About the middle of the day they sat down in the shade of a great pine-tree to rest and eat the luncheon they had brought with them. When Crisman had satisfied his appetite, which was a very fine one, he lighted a cigar and stretched himself upon the ground, covered thickly with sweet-scented pine needles, to have a smoke and enjoy the situation. Stratford sat near by, looking upon the young man with an expression in which there was an odd mixture of kindly feeling and antipathy. He had found in Crisman much of that buoyant good nature which was so noticeable in Gay, and it seemed difficult to believe that under any circumstances he would be aught but a cheery and heartening companion; and this disposition should count against a great many shortcomings in a matrimonial partner. But at the same time there was an air of self-assertion about Crisman which was unpleasant to the other. There was no occasion for his asserting himself against anything, or in favor of anything; and this assertion seemed to be a habit consequent upon a belief in a man's right to demand from others the recognition of his merits. His theories, his creeds, and his prejudices were placed, so to speak, in his shop window, and he stood at his door calling upon the passers-by to look upon them.

"There's something very jolly and independent in all this," said Crisman as he unlaced and kicked off one of his heavy boots. "There are no bonds of slavery here; no goods to sell, no books to keep, no customers, no firm, no women."

"Do you number women among your bonds of slavery?" asked Stratford.

"That depends," answered Crisman. "There are moments when a woman is a good deal of a clog. For instance, if we had brought the ladies with us, I could not have made myself comfortable by kicking off that boot."

"Very true," said Stratford.

"I don't want you to think," continued Crisman, after a puff of tobacco smoke had leisurely curled itself up from his mouth, as he lay stretched upon his back, his head resting on his coat, which he had rolled up for a pillow, "that I've got anything to say against women. I am the last man in the world to do that. I suppose you know I am going to marry, and one of the finest human beings to be found on this planet will be my wife. If you knew Miss Gay Armatt as I know her, you'd agree to that."

"I agree perfectly," said Stratford.

"I truly believe," continued Crisman, "that there isn't a girl like her. I'm not fool enough to say she is absolutely perfect,—an angel all but the wings,—but I will say this: that with the exception of the way she has been over-educated,—and that, in my opinion, was the fault of other people more than her own,—she can't be improved upon."

"Over-educated?" remarked Stratford.

"Yes, sir," said Crisman; "that's exactly the word. She spent four solid years in learning things which will be of no more use to her than another pair of legs would be to that bird which you see flying along up there. When she entered that college she was seventeen years old, and as well educated as any girl on earth need want to be; and yet she has wasted four years of her life in slaving at mathematics, Latin, and Greek, and I don't know what else besides which are of no use whatever to a woman who expects to be a wife and a mother and the head of a family. I don't say this to Gay, because it is done now and can't be helped, and there's no use raking up trouble about it. And I don't say it to Mrs. Justin, because she had a very large finger in the pie, having pushed Gay on in this college business more than anybody else. But I say it to you, because you are a man, and can understand how I feel about it. I speak warmly on this matter, because I know lots of other girls who are going on in the same way Gay has gone, and I think it's a shame that they are allowed to waste a good part of their lives in stuffing their minds with what to them is no more than dead leaves and ashes. Now, look at Gay Armatt. You wouldn't believe it, but she's twenty-one years old, and she might as well have been married three years ago. In that case she wouldn't have married me, because I didn't know her then; but that doesn't alter the princi-

ple of the thing. Now, allow one year for courting, just look at the four years of absolute happiness that have been taken out of her life by this absurdity of sending her to college. If it had been really necessary for her to earn her living as a teacher, that would have been another thing; but her friends ought to have known that for a girl like her there would be no necessity for anything of that kind. And that's the case with nine-tenths of the girls who go to college. They don't intend to be teachers; and as soon as they get themselves graduated they begin to be interested in the things which really concern them, and forget all they have been taught at college in a confounded sight less time than it took them to learn it. The education that sticks to them is what they got before they went to college. Now I want you to understand I'm not saying anything against Gay Armatt. She has lost a lot of time, but that can't be helped; and what she has learned isn't going to hurt her. She talks a great deal about keeping up her studies after we are married, and making herself mistress of this and that thing which I don't understand, and which, to tell the truth, I never tried to. I don't say a word against all this, but just leave it to her own good sense to find out that when she has got her hands full of what makes up a woman's real work in this world, she will have to give these other things the go-by."

"But suppose she doesn't see that for herself?" asked Stratford.

"My dear sir," said Crisman, sitting up and throwing away his cigar, "I am one of the most indulgent men in the world, and an easier-going temper than mine you won't meet with often; but if I had a wife who didn't see that her true duty in life had nothing to do with the higher mathematics and Greek verbs, I'd make it my business that she did see it. There won't be anything of this kind necessary with Gay, because she's not the sort of girl to want to make my life miserable by poking among rubbish of that sort. When she knows I don't like it, she'll stop it."

At that moment a drinking cup of glass which Stratford had been holding in his hand came heavily to the ground.

"Anything broken?" asked Crisman, with a quick turn of his head.

"Yes," said Stratford, rising; "I think there is."

Crisman looked at the fragments of the cup, and laughingly remarking that that was a case past mending, put on his coat, and took up his rod and basket.

XIV.

WHEN Mr. Crisman, toward the end of the afternoon, returned from his fishing excursion,

he was seen from afar by Miss Gay, who ran to meet him. As she came up to him she first inquired why Mr. Stratford had not come back with him, and then asked if he had had a good day's sport. She might have asked the second question first had it not been, in fact, only a matter of form; for she saw in her lover's face and demeanor that he had been enjoying himself.

"Success!" he exclaimed. "I should say so!" And he lifted the lid of his basket. "Look at that! I should have caught a lot more, for they were rising just as well as ever, but Stratford said we had all that the two families could possibly eat, and he didn't see the use of catching any more. That is not my way, for when I go fishing, I go to catch all I can get and make a big count; but, of course, as I was using his tackle and things, I didn't press the matter, and we stopped an hour or two sooner than there was any need to. I did suggest that he should come back with me, but he didn't seem to take to the idea."

Gay thought that when people had caught all the fish for which they had any use, it was a very sensible and humane thing to stop fishing. And she thought, moreover, that Mr. Stratford appeared to have good ideas on a great many different subjects; but she did not speak her thoughts. She had no doubt that, as Charley grew older, he would discover for himself a great many of the things which Mr. Stratford had discovered for himself.

At dinner that evening the apparent disinclination of Mr. Stratford to visit at Cherry Bridge was mentioned both by Gay and Crisman; and although Mrs. Justin passed the matter over without comment, her mind was a good deal disturbed. It was an abnormal and exceedingly unpleasant state of affairs when her old friend Stratford lived at the Bullripple farm and did not come to Cherry Bridge. Not only did Mrs. Justin regret it because it deprived her of the company of her friend, but she feared very much that Stratford's absence might be noticed, and that the people in the neighborhood might connect it in some way with Gay's presence at Cherry Bridge. Gossip of this sort would be painful and even abhorrent to Mrs. Justin, and she determined to put an end to what she considered a very unnatural condition of things.

After Mr. Crisman's departure the next morning, she drove herself over to the Bullripple farm, where she was fortunate enough to find Mr. Stratford mending some fishing-tackle under the shade of a great oak in the front yard.

"I have come to have a very plain talk with you," she said.

"I am glad of it," said Stratford; "and here is the easiest outdoor chair the place affords."

"It may not be a very long conversation," she said, "for I hope you will readily agree with me that it is absolutely wrong, from whatever point it may be looked at, for an old friend, such as you are, to live so near my house without visiting it. Of course I know the reason; but I don't think there ought to be any such reason. I trust you have come to the conclusion that you are altogether mistaken in your ideas about the engagement of Mr. Crisman and Gay, and that you no longer think it your duty to interfere in the matter. That being the case, I am most anxious to tell you how earnestly I desire that you should visit my house as you used to, and be the same good friend to all of us that you once were."

Mrs. Justin leaned forward as she spoke, and there was a touch of moisture in her beautiful eyes.

Stratford looked at her steadily for a moment before he spoke. "Mrs. Justin," he said, "you cannot imagine what pain it gives me to hear you speak in that way, and to answer you as I must."

"It often seems to me," said Mrs. Justin, drawing herself a little back, "that when persons do things that not only give themselves pain but greatly grieve their friends, it should be self-evident that the way to make everybody happy is to stop doing those things."

Stratford smiled. "That quick way out of trouble won't answer in this case. I have the greatest possible desire to visit your house, but I must also state that since our last conversation your views and mine concerning Miss Armatt's engagement have become more widely different than they were before. I now believe that it would be an actual crime to allow that man to marry her."

"And you still persist," said Mrs. Justin, "in your intention of endeavoring to win her away from him."

"If the end can be accomplished in no other way, I most certainly do," said Stratford.

"Then, of course," said Mrs. Justin, her face paling a little as she spoke, "it will not do for you to visit Cherry Bridge while Gay is there."

She made a motion as if she were about to rise, but Stratford quickly said: "Do not go. There is much more I wish to say to you."

She kept her seat, and, leaning back in her chair, she sighed. "Oh," she said, "if you would only tell me that you had determined to let these two be happy in their own way, how thankful I should be!"

"I have been thinking over this matter a very great deal," said Stratford, "and if you will be willing to join with me in what I wish to do, I will make an entire change in my plan."

"Join you!" exclaimed Mrs. Justin.

"That is exactly what I mean," he continued. "I want you to help me save this girl—your friend, whose promise and worth you know so thoroughly—from an absolutely unfit marriage."

"Mr. Stratford," said she, "you know very well that I would sooner cut off my hand than to try to make a girl and a young man break the solemn promises that they have made to each other, especially when I know that they love each other with all their hearts."

"I have believed," said Stratford, "and still believe, that the very best way of making Gay Armatt understand the wrong position she has taken in engaging herself to Crisman is to give her an opportunity of becoming acquainted with other men; and I do not think I have flattered myself very much when I drew her attention to myself as a better man than Crisman. I do not hesitate to say to you that I believe that, had I the opportunity, I could make her understand what a companionship for life ought to be, and that she could never expect such a companionship in Crisman."

"It is perfectly horrible to hear you talk that way," said Mrs. Justin.

"But I do not intend to insist," said Stratford, "that this plan of mine is the only one by which Gay Armatt can be saved from the fate which threatens her; and if you will undertake to make her perceive that it is a duty she owes to herself not to marry Crisman, I will give up my scheme which is so objectionable to you, and will retire absolutely from the affair."

"Why do you talk to me in that way?" said Mrs. Justin. "You know perfectly well that I would never consent to do anything of the kind."

"I thought it right to give you the opportunity," said Stratford. "I knew you could exert a powerful influence on your young friend; but, in spite of that, I should have very great fears for your success. The arguments of parents and friends against the suitability of lovers are generally but words wasted. In such cases it is better to divert the stream than to try to dam it. But, as I said before, notwithstanding my preference for my own plan, I am perfectly willing if you will undertake this work—"

"Which I won't," interrupted Mrs. Justin. — "to put it into your hands. But, as you decline to take it, I feel it my duty to go on with it, if I shall have the opportunity."

"Mr. Stratford," said his companion, leaning forward towards him again, "do you know anything terrible about Mr. Crisman, which makes you so relentless towards him? Has he committed a crime, or what is the matter with him, that you stand up so obstinately and declare that he shall not marry the woman

of his choice? It cannot only be that he is of a lower intellectual grade than she. There must be something more than that which makes you wish to interfere between persons with whom you have no connection whatever."

"If you will look upon the matter with unbiased judgment," said Stratford, "I think you must see that Crisman, for his own benefit and advantage, purposes to commit a crime." And then, more minutely and forcibly than he had ever spoken of it before, he told Mrs. Justin what he had found Crisman to be, and deduced from that the disastrous result to Gay of her marriage with him.

Mrs. People sat at one of the open windows of the farm-house, shelling peas and looking across the yard at the two who were talking under the great oak-tree. It was very easy to see that their business was important, and she hoped, from the bottom of her heart, that Mr. Stratford was making up his mind to buy a certain outlying portion of Mrs. Justin's estate. Often and often had Mrs. People urged that purchase upon him, and she did trust that now her words were beginning to come to something. To be sure, she would be very sorry not to have him live with them every summer, but all that might stop at any time; and he would make a most excellent summer neighbor, both to herself and brother, and to Mrs. Justin. And, more than that, the fact that a city man came to Cherry Bridge and bought property and built, would help the sale of land in the neighborhood, and might put money into Enoch's pocket and, ultimately, into that of her son John. Therefore she did most truly trust that Mr. Stratford was telling Mrs. Justin just exactly what he was willing to give, and that she would agree to it.

Stratford talked earnestly and steadily and a long time; and when he had finished, Mrs. Justin arose from her chair.

"You have convinced me but of one thing," she said, "and that is, you truly believe your motive is a good one. What you say of Mr. Crisman may be true now, but he is still young, and I cannot believe that it will always be true; and, in any case, there is the fact before us that the two have promised to marry each other."

She moved towards her pony carriage, he walking by her side. "I see that I can make no impression on you," she said; "but still I do not intend to give up my object of restoring the old condition of friendly intercourse between us. I cannot say now what I shall do, but the thing must be done. If necessary, Gay's visit to me shall be brought to a close."

(To be continued.)

"I beg of you," said Stratford earnestly, "not to think of anything of that sort. I will go away myself."

"How will that help to restore our friendship, and give me an opportunity of discussing with you all those points I have set down in my memorandum-book? No, you must stay here; and in a day or two I'll let you know what I've determined upon. I will do nothing without first advising you of it."

And she stepped into her phaeton, and took the reins which Stratford handed to her.

When Mr. Stratford returned from a long drive at the close of the next day, he was handed a note from Mrs. Justin which had arrived for him in the morning. It read as follows:

"DEAR MR. STRATFORD: From the moment you read this I wish you to understand that you are to come to see us just as often and stay as long as your important engagements with trout and mountain views will permit. Do not imagine from this that I have exiled my dear Gay. Her presence here need not have the slightest effect on your coming, and your coming will not have the slightest effect upon her. This may appear a little cruel, but I must admit that I take a certain wicked pleasure in writing it. As I do not wish to mystify you any longer, I will immediately state that I have had a long conversation with Gay, and I find that you and I might have saved ourselves the trouble of discussing the subject of her engagement. She is perfectly devoted to Mr. C——, and I am positive that there is no person living who could divert her affections from him. I always knew she loved him most sincerely, but I never imagined the strength and depth of her affection until I had that talk with her last evening. And, more than that, if you could hear, which you shall not, the plans which this dear girl, now opening her soul for the first time in fullest confidence to a friend, has made for work with him and for him, you would long for the power to deny to yourself that you had ever thought of interfering with their happiness. One of the strongest points in favor of her complete success in carrying out her plans is that she knows his shortcomings, and, in my opinion, has most admirable ideas with regard to the way in which they ought to be treated. She will be a guardian angel to him, and I firmly believe that, in one year after their marriage, Mr. Crisman will be an entirely different person from the young man whom we now know. So you see, my dear philanthropist, that your schemes for this young lady's benefit can come to nothing; that is, they cannot produce the result which you desire. Their only effect will be that her studies will be assisted, her knowledge of the world will be increased, and her mind will receive that polish from contact with the mind of a thoroughly well-educated and cultured man which I desired when I planned for the frequent companionship of yourself and Gay. Yours, in a most delighted state of mind,

"LILIAN JUSTIN.

"P. S. Of course, in my conversation with Gay, I never alluded to you in any way.

"In reading over this letter, I cannot help feeling a little sorry for you. I know I ought not to have such a feeling, but I have it — just a little."

BERNARD PALISSY.

FRENCH SCULPTORS.

BARRIAS, DELAPLANCHE, LE FEUVRE, FRÉMIET.

BARRIAS, M. Delaplanche, and M. Le Feuvre have each of them quite as much spontaneity as M. Falguière, though the work of neither is as important in mass and variety. M. Delaplanche is always satisfactory, and beyond this there is something large about what he does that confers dignity even in the absence of quick interest. His proportions are simple, his outline flowing, and the agreeable ease of his compositions makes up to a degree for any lack of sympathetic sentiment or impressive significance: witness his excellent "Maternal Instruction" of the little park in front of Sainte Clothilde. M. Le Feuvre's qualities are very nearly the reverse of these: he has a fondness for integrity quite hostile in his case to simplicity. In his very frank appeal to one's susceptibility he is a little careless of sculptural considerations, which he is prone to sacrifice to pictorial ends. The result is a mannerism that in the end ceases to impress and even becomes disagreeable. As nearly as may be in a French sculptor it borders on sentimentality, and finally the swaying attitudes of his figures become limp, and the startled-fawn eyes of his maidens and youths appear less touching than lackadaisical. But his being himself too conscious of it should not obscure the fact that he has a way of his own. M. Barrias is an artist of considerably greater powers than either M. Le Feuvre or M. Delaplanche; but one has a vague perception that they are limited, and that to desire in his case what one so sincerely wishes in the case of M. Dubois, namely, that he would "let himself go," would be unwise. Happily, when he is at his best there is no temptation to form such a wish. The "Premières Funérailles" is a superb work — "the chef-d'œuvre of our modern sculpture," a French critic enthusiastically terms it. It is hardly that; it has hardly enough spiritual distinction — not quite enough of either elegance or elevation — to merit such sweeping praise. But it may be justly termed, I think, the most completely representative of the masterpieces of that sculpture. Its triumph over the prodigious difficulties of elaborate composition "in the round," — difficulties to which M. Barrias succumbed in the "Spar-

tacus" of the Tuileries Gardens, — and its success in subordinating the details of a group to the end of enforcing a single motive, preserving the while their individual interest, are complete. Nothing superior in this respect has been done since John of Bologna's "Rape of the Sabines."

M. Emmanuel Frémiet occupies a place by himself. There have been but two modern sculptors who have shown a more pronounced genius for representing animals — namely, Barye and his clever but not great pupil Cain. Barye is well enough known to every one. The tigress in Central Park, perhaps the best bronze there (the competition is not exacting), and the best also of the many variations of the theme of which, at one time, the sculptor apparently could not tire, familiarizes Americans with the talent of Cain. In this association Rouillard, whose horse in the Trocadéro Gardens is an animated and elegant work, ought to be mentioned, but it is hardly as good as the neighboring elephant of Frémiet as mere animal representation (the *genre* exists and has excellences and defects of its own), while in more purely artistic worth it is quite eclipsed by its rival. Indeed, it is perhaps an injustice to M. Frémiet to find his superior in Cain, judging the two strictly within the limits of the Cain *genre*; some of Cain's works are incontestably inferior to anything of the sort which Frémiet has signed. But if *fauna* is interesting in and of itself, which no one who knows Barye's work would controvert, it is still more interesting when, to put it brutally, something is done with it. In his ambitious and colossal work at the Trocadéro, M. Frémiet does in fact use his *fauna* freely as artistic material, though at first sight it is its zoölogical interest which appears paramount. The same is true of the elephant near by, in which it seems as if he had designedly attacked the difficult problem of rendering embodied awkwardness decorative. Still more conspicuous of course is the artistic interest, the fancy, the humor, the sportive grace of his Luxembourg group of a young satyr feeding honey to a brace of bear's cubs, because he here concerns himself more directly with his idea and gives his genius freer play. But it is when he leaves this kind of thing entirely, and, wholly forgetful of his studies at the Jardin des Plantes, devotes himself to purely monumental work, that he is at his best. And in saying

INSTRUCTION.

ENGRAVED BY JOHN P. DAVIS.

this I do not at all mean to insist on the superiority of monumental sculpture to the sculpture of *fauna*; it is superior, and Barye himself cannot make one content with the exclusive consecration of admirable talent to picturesque anatomy illustrating distinctly unintellectual passions. M. Frémiet in ecstasy over his picturesque anatomy at the Jardin des Plantes would scout this; but it is nevertheless true that in such works as his "Louis d'Orleans," in the quadrangle of the restored Château de Pierrefonds; his "Jeanne d'Arc," in the Place des Pyramides; and his "Torch-bearer" of the Middle Ages, destined for the new Hotel de Ville of Paris, not only is his subject a subject of loftier and more enduring interest than his elephants and deer and bears, but his own genius finds a more congenial medium of expression. In other words, any one who has seen his "Torch-bearer" or his "Louis d'Orleans" must conclude that M. Frémiet is losing his time at the Jardin des Plantes. In monumental works of the sort he displays a commanding dignity that borders closely upon the grand style itself. The "Jeanne d'Arc" is indeed criticised for lack of style. The horse is fine, as always with M. Frémiet; the action of both horse and rider is noble; and the homogeneity of the two, so to speak, is admirably achieved. But the character of the Maid is not perfectly satisfactory to *a priori* critics, to critics who have more or less hard and fast notions about the immiscibility of the heroic and the familiar. The "Jeanne d'Arc" is of course a heroic statue, illustrating one of the most puissant of profane legends; and it is unquestionably familiar and, if one chooses, defiantly unpretentious. Perhaps the Maid as M. Frémiet represents her could never have accomplished legend-producing deeds. Certainly she is the Maid neither of M. Chapu, nor of M. Bastien Lepage, nor of the current convention. She is rather pretty, childishly sympathetic, *mignonne*; but M. Frémiet's conception is an original and a gracious one, and even the critic addicted to formulæ has only to forget its title to become thoroughly in love with it; beside this merit *a priori* shortcomings count very little. But the other two works just mentioned are open to no objection of this kind or of any other, and in the category to which they belong they are splendid works. Since Donatello and Verrocchio there has been nothing done which surpasses them; and it is only M. Frémiet's fancy for animals, and his fondness for exercising his lighter fancy in comparatively trivial *objets de vertu*, that obscure in any degree his fine talent for illustrating the grand style with natural ease and large simplicity.

I have already mentioned the most representative among those who have "arrived" of the school of French sculpture as it exists to-day. There is no looseness in characterizing this as a "school"; it has its own qualities and its corresponding defects. It stands by itself — apart from the Greek sculpture and its inspiration, from the Renaissance, and from the more recent traditions of Houdon, or of Rude and Carpeaux. It is a thoroughly legitimate and unaffected expression of national thought and feeling at the present time, at once splendid and simple. The moment of triumph in any intellectual movement is, however, always a dangerous one. A slack-water period of intellectual slothfulness nearly always ensues. Ideas which have previously been struggling to get a hearing have become accepted ideas that have almost the force of axioms; no one thinks of their justification, of their basis in real truth and fact; they take their place in the great category of conventions. The mind feels no longer the exhilaration of discovery, the stimulus of fresh perception; the sense becomes jaded, enthusiasm impossible. Dealing with the same material and guided by the same principles, its production becomes inevitably hackneyed, artificial, lifeless; the *Zeit-Geist* is really a kind of Sisyphus, and the essence of life is movement. This law of perpetual renewal, of the periodical quickening of the human spirit, explains the barrenness of the inheritance of the greatest men; shows why originality is a necessary element of perfection; why Phidias, Praxiteles, Donatello, Michael Angelo (not to go outside of our subject), had no successors. Once a thing is done it is done for all time, and the study of perfection itself avails only as a stimulus to perfection in other combinations. In fact, the more nearly perfect the model the greater the necessity for an absolute break with it in order to secure anything like an equivalent in living force; in *its* direction at least everything vital has been done. So its lack of original force, its over-carefulness for style, its inevitable sensitiveness to the criticism which is based on convention, make the weak side of the French sculpture of the present day, fine and triumphant as it is. That the national thought and feeling are not a little conventional, and have the academic rather than a spontaneous inspiration, is, however, just now beginning to be distinctly felt as a misfortune and a limitation by a few sculptors whose work may be called the beginnings of a new movement out of which, whatever may be its own limitations, nothing but good can come to French sculpture, but of which any adequate account merits a paper by itself.

DRAWN BY WYATT EATON.

THE CATHEDRAL CHURCHES OF ENGLAND.

(INTRODUCTORY PAPER.)

I.

CERTAIN Oriental artists have attained a rare skill in cherry-pit sculpture, and inside the more generous frame of a horse-chestnut shell they can be positively panoramic. I am no fellow-craftsman of theirs to paint

the full semblance of England's cathedrals within a scant half-score of chapters.

Nor, were my canvas ever so widely stretched, could I pretend to be qualified for such a task. Historian, social philosopher, architect, ecclesiologist,—all of these he ought to be who would attempt it; and a prose-poet, too, to translate a charm beyond the reach of unwinged words, and to keep true and sensitive tally of those hour-to-hour impressions which may give a reflection of things and facts almost more interesting than their mere portrayal,—showing a vision of ourselves as we should be, touched in our inner fiber by their inmost essence. Truly, if a title were a promise, if in its sound were implied a pledge to exhaust its suggestiveness, I might well be daunted by the sound of mine.

But I recognize no such pledge or promise. I take these very first words to confess myself a mere desultory sketcher with an amateur's outfit. And if, nevertheless, I sit myself down

before one of the finest, most complicated, most exacting subjects in the world, I do no more than fall in with the traditional practice of my kind. I know that traditional ridicule attends this practice—often enough have we been told that if angels, for instance, were in our shoes, their methods of advance would be different from ours. Yet we have a very valid excuse to make for ourselves. The angel it is—the divine master with brush or pen—who can take a little subject and make it big with interest. He it is who can manufacture his own charm, evolve his own significance, weave his own poetry out of some dry and small suggestion his outer eye has noted; his weaker brother must depend upon *what* he paints for all the value of the outcome.

Yet I cannot venture here to draw for help upon all the stores in this vast magazine of ready-made beauty and interest. Some ten or a dozen cathedral churches must suffice me, selected from the whole list (which numbers nearly as many as did those delightful pilgrims

TOWER OF NORWICH CATHEDRAL. (NORMAN.)

who once ambled forth from the Tabard Inn to seek the most famous of all), partly because of their greatness as buildings, and partly because of their length and richness of life as cathedrals.

II.

FREQUENT, I imagine, is the misconception which confuses the two claims — which sees in “cathedral” but a synonym for a church-building of the first architectural rank. Architecture has really nothing to do with the cathedral name, nor (and least of all in England) has the greatness of the city in which the building stands. A “cathedral church” is simply a church which is the ecclesiastical center of a diocese, which holds a bishop’s official chair, his *cathedra*. With the setting-up of this chair comes the cathedral title; with its removal the title goes: there is no other cause or definition of it. Yet, though size and splendor do not make a church a cathedral church, it is but natural that they should always have seemed inseparable from its being. It is but natural that her churches of highest ecclesiastical rank should be among England’s greatest and most splendid.

Among her greatest, I say. Not they alone absorbed the architect’s noblest efforts; not in

them alone lie petrified the most lavish gifts of hands made generous by piety, or ostentation, or remorseful terror. The mere abbey or collegiate church often equaled the cathedral church in all but dignity of service. Sometimes even this was added unto it at a day long subsequent to its day of birth. Often, on the other hand, it was shattered into splendid fragments under that hammer, curiously called “Reform,” with which the sixteenth century warred against monasticism. Yet still at this late moment some of the mightiest fanes in England stand intact. Some of these, however, are beyond the limits of our title. If I name Westminster Abbey only I shall give sufficient illustration.

III.

WHEN it is said that least of all in England should we think of a cathedral church as necessarily the chief church in some town chief itself among its neighbors, one hints at facts in which lies fossilized a record of the very first beginnings of English dominion in the land.

The earliest island Church, we know, had not a drop of English blood in its veins, but was British and Roman in a union whose elements we cannot now distinctly balance. When the Romans went and the English came (those Jutes and Saxons and Angles we are used to calling the Anglo-Saxons), their heathen triumph swept Briton and Church away together — not wholly out of the island-world, yet out of most of those districts which are now England proper. However the sparks of

WEST FRONT OF IFFLEY CHURCH. (NORMAN.)

LANCET WINDOWS, CHESTER CATHEDRAL.

Christianity may have lingered here, dimmed, confused, and scarce perceived amid British serfs and bondwomen, a Christian *Church* lived on only in Ireland and in those portions of the larger isle which lay beyond the conquered north or bordered on the western sea.

Later on, this elder Church threw out fresh shoots and played a distinct part in the re-evangelizing of the land. But the main influence toward this result, the stock which budded first when the land was a land of Englishmen, and afterward absorbed and assimilated all the potency of the ancient sap, came, toward the end of the sixth century, direct from Rome, at the bidding of Pope Gregory the Great and with St. Augustine as its first apostle.

The state of England in the constructive times which were then beginning was very different from the state of Gaul or Italy or the Rhine lands at the time when their still-existing Churches had been given coherence of form and fixity of feature. The destruction of Roman or semi-Roman civilization — wreck and ruin which had had no parallel elsewhere — had meant the destruction of all but a few of the larger towns and the establishment of a number of petty rulers who were rulers of *tribes*; who, so far from basing their authority on preëxisting civic authority, had often no such thing as an even nominal capital.

So when the first English bish-

oprics were laid out (Theodore of Tarsus doing much of the work as Archbishop and agent of Rome in the later years of the seventh century), the first thing considered was the demarcations of these tribal settlements, the limits of those little kingdoms among which the land was divided up. In accordance with political boundaries ecclesiastical boundaries were laid down; and then the best spot was chosen for the planting of the bishop's chair. Sometimes the choice fell naturally upon one of the few remaining great ancient burghs — as on London, as on York. But sometimes it fell on a town like Canterbury which had never been very conspicuous before, and sometimes perforce upon one of those isolated ecclesiastical foundations which missionary hands had set and watered in the wilderness.

Of course the voice of time did not always indorse the first selection of the early planner. With changing conditions came many changes of cathedral station, as when certain southern sees, defenseless in their rural isolation against the Danish devastator, were shifted to more easily protected spots; as when the Norman conqueror used his strong hand, and the Church of England proved as plastic as the State beneath it. But many of the cathedrals still stand where they stood at first, and the aspect of all, looked at collectively, is characteristic in the extreme.

Total is its unlikeness to the general aspect of the cathedral churches of those continental lands where a multitude of cities had held dominion over their encircling districts for centuries before Christianity was preached. There naturally it was first preached to these cities, first accepted by their indwellers; and naturally they absorbed the new ecclesiastical in addition to the old temporal supremacy. French dioceses still follow the lines of Roman districts, and their present cathedral towns are the ancient Roman centers. Even in the etymology of *pagan* we can read the history of continental Christianizing.

But north of the Channel there were no such great municipal entities, neither in the earliest English times nor at any time thereafter. Long-divided as was the realm, it was never split up between rival towns; torn asunder as it often has been since, no part has ever been the prize of civic duels. And these facts and their still persisting influence upon English life and sentiment speak very

CLUSTERED COLUMN,
EXETER CATHEDRAL.
(EARLY ENGLISH.)CLUSTERED COLUMN,

clearly through the voice of the cathedral churches, despite the Conqueror's efforts to bring about a state of things more like the one he knew at home, and despite that general modern impulse toward centralization from which even England has not been wholly free. If, for example, it is true that one of the new bishops of our day has had his chair set for him in the great town of Manchester, he has been given a still younger brother at Southwell and another at St. Albans — two spots where not the town at all but the great old church-building only can seem to continental eyes to deserve the cathedral name.

And thus the cathedrals of England show not merely a general unlikeness to their foreign rivals but also a marvelously delightful diversity among themselves. Now we find St. Paul's of London and the great minsters of Lincoln and of York standing in towns which were great at the dawn of history and show relics of an art much older than their own. Again, as around the towers of Durham or the spire of Salisbury, we see a town that now has considerable size and independent dignity, but which owed its first beginnings, and still visibly confesses the indebtedness, to the setting-up of its *cathedra*. And yet again there are cathedral cities* — Ely and Wells are the extreme examples — that are but little parasitical growths around the base of the church; whose life lives only, even in our day, in the life of the great fane itself.

Not holding some strong military position, not rising close above the steep steps of the

* Accurately speaking, a "city" in England is any cathedral town however small, and no other town however great. Such an interpretation sounds oddly in our ears; but interestingly if we may explain it — I have no idea whether we really may or not — as reflecting, in a faint verbal mirror, that continental state of things to which reference already has been made.

roofs of a city, not pressed close about by the homes of laymen and the crowds of street and market-place, stand those English cathedrals which are most purely and typically English in expression; but set about with great masses of foliage and swept about by wide peaceful lawns, the very norm and model of England's greenery — telling, however, by the fragmentary walls and crumbling gateways which keep distant guard about them, that after all they were not built in such piping times of peace as ours. Even when the church does not stand in the most typically English manner, still it is charming to see how its expression will not wholly give the lie to national characteristics. Even St. Paul's has some shreds of dusty foliage to show, and though the huge façade of Lincoln looks out on a small paved square, and though our first glimpse of York shows us the long south side through the narrow perspective of a street in the oldest and densest portion of the town, even so as we turn the mighty shoulder we find the broad, grassy spaces which prove we are in England still. Therefore, there is one thing quite indisputable: we may do as we like across the Channel, but an English pilgrimage must be made with the tree in leaf and the sward in flower.

IV.

WHEN in the earlier ages a cathedral was established, it became (in a far truer sense than it remains in our own day) the hearth and focus of the religious life of its district. It needed a large staff of clergy specially devoted not only to the services within its walls but to the general work of the diocese; specially charged and enabled to be the bishop's helpers as those could not be who were parish priests with definite local duties of their own. In a large town this staff of clergy,

PLATE TRACERY, LILLINGTON CHURCH.
FROM THE IMPERIAL DICTIONARY.

this cathedral "chapter," scarcely needed definite creation. But in England the peculiar circumstances I have tried to explain naturally brought about an intimate union between the cathedral establishment and some great collegiate or monastic body. Sometimes a body of this sort was formed to meet the cathedral's need; but often its prior existence was the fact which dictated the position of the local bishop's chair.

The union once accomplished, both parties waxed great by mutual aid. The "house" was ennobled by the episcopal rank of its head; the bishop's arm was strengthened by the wealth and influence of the house; and the great edifice was the work and the home and the glory of both alike.

In some cases, I say, the cathedral chapter was collegiate and in some cases was monastic. That is, its members were sometimes mere "secular" priests, bound by no vows save those which all priests assumed, living as members of a collegiate foundation but not living in common, each one having his own individual life and home — which often meant in earlier times his own lawful wife and children; and again they were monks, were bound by monastic vows, were called "regulars" because they lived in common according to some monkish rule.

I need not try to note the way that many chapters were meddled with in many ages according as those in authority above them gave personal preference to the monkish or to the "secular" life. But the interference of the Reformation has left its traces in a nomenclature which demands a word of explanation. The merely collegiate chapters were allowed by the Reformers — that is, by their mighty master Henry — to live on in a generally unchanged condition. Catholic priests eventually became Protestant clergymen, and thereby their functions and their lives were largely altered; but the chapter as such was not annihilated, and so a cathedral which has a chapter of this sort

is known to-day as a cathedral "of the Old Foundation." But it went harder with the monkish chapters. These were dissolved and done away with in the clean sweep which Henry made of all monastic things. With one or two exceptions, due to the abolition of the see itself, they were reorganized with new blood in quite another shape; and here and there fresh sees were established with their Protestant bishops, deans, and canons. A cathedral whose history reads thus is to-day, by contrast, "of the New Foundation."

So, we see, a cathedral of the New Foundation is not of necessity new as regards the building or even as regards the cathedral title. It may be a church as old as Peterborough or as Gloucester, each of which was but an abbey church until the sixteenth century. Or it may be a cathedral which has held its rank since such rank was first given in its district — may be Rochester or Worcester, may be Canterbury even, the hoary mother-church of all. "Old" and "New" are used of the constitution of the chapter only.

I am sorry to dwell so long in dusty definitions. But they will be picturesquely illustrated by and by through things whose interest we should wholly miss but for some such little reading of ecclesiastical history. As we pass from one cathedral to another we shall see how great, how radical, how delightful to the eye are the architectural differences that have resulted from the former existence here of secular canons, a collegiate chapter, and there of regular canons, a monastic chapter. And the general fact that such chapters existed in so dignified an estate, in so intimate a union with the episcopal seat, is another great cause of the general difference in aspect between the English cathedrals and their sisters over-sea.

I have told of the wide, lordly spaces in which they most often stand — showing that they were first and the cities only second and subordinate in importance. But within these

GEOMETRICAL TRACERY, RIPON CATHEDRAL.
FROM THE IMPERIAL DICTIONARY.

spaces they did not stand in self-centered isolation, in grave hierarchic solitude, but side by side with the homes of those who served their altars and labored for their interests and dispensed their bounty and swung their spiritual, and sometimes, too, their temporal, sword; side by side with chapter-houses and dormitories and cloisters and refectories and libraries, with schools and infirmaries and bishops' palaces and canons' dwellings; yes, and with warriors' castles too. There is scarcely a variety of mediæval architecture whose traces we may not study while keeping a narrow path from one of England's cathedral gateways to another, scarcely one from the most gorgeously ecclesiastical to the most simply domestic, most purely utilitarian, most frankly military. And the fact is characteristically English; no cathedral series elsewhere is so all-embracing, so infinitely diversified. There is nothing on the continent which parallels the wide, green, shaded acres in which Salisbury, for example, first appears to us, and there is nothing which matches the palace beyond, set in its fairy-land of garden. There is nothing abroad, with a great cathedral church as its central feature, which reveals the cloister-life of the middle ages as do the ruins of the monastic establishment at Canterbury—ruined because it *was* monastic; or which reveals the collegiate life of the same period as does the marvelous group of still-existing homes at Wells—still existing because they were *not* monastic.

v.

NOT so wholly as in continental lands does the history of ecclesiastical architecture in England mean the history of large and sumptuous or city churches. England has in her myriad rural parish churches a treasure nowhere equaled. Yet it is of course to her greater structures we must look if we would see the high-water mark of her artistic current. The lowlier the task, the lowlier the talent that may achieve success. If she had never built aught else than her parish churches, uniquely lovely though she made them, she would have confessed herself out of the race with the great building-nations of the mediæval world. It is to her cathedrals and abbey churches we must look (just here, as I have said, to her cathedrals only), if we would see how age by age she kept pace with these.

Almost every step of her development may be read in them. The only blank that occurs is at the very beginning; the only lack is of ante-Norman relics. And even this blank is due, not to any want of early effort with the higher problems of the art, but in part to Danish torches and in part to a later (and

what may seem to us a misdirected) energy of reconstruction. When architecture was a vital art, growing from year to year, developing from hand to hand, altering logically and inevitably to meet each new requirement, to suit each generation's novel taste, there was small reverence felt for work that was out of date, for work that was out of touch with the current time alike in practical and in æsthetic ways. For long years before the Conquest, there had been cathedral churches in England, large and stately, we may believe, and insularly individual. But they melted like snow beneath the hand of that Norman in whose virile soul zeal for religion and love for building were as potently developed as rage for battle, dominion, and earthly pelf. Standing though they sometimes do on sites that have been cathedral sites from the dawning of Christianity, not one among the cathedrals of England shows above

FLOWING TRACERY, WELLS CATHEDRAL. (DECORATED STYLE.)

the level of the soil a stone of its pre-Norman predecessor. The architectural history of England, as her cathedrals show it, begins with the coming of the Norman. But thence it may be traced through every age of arched construction down to that of the classic revival. And this age, too, fortunately found its best expression—left what is not so much a type as the one only splendid flower of English Renaissance effort—in the cathedral of St. Paul in London. With it our series will come to a full stop, and for our purpose there will be in the subject no break, no gap, which might profitably be filled. English architecture, truly to be so called, comes itself to a full stop with this last of its cathedral churches.

The style the Normans brought with them from the continent (it began to come a little earlier than the Conquest, with the Norman

ONE BAY OF THE "ANGEL CHOIR," INTERIOR, LINCOLN CATHEDRAL. (DECORATED STYLE.)

influx to the Confessor's court) was a development, proper to themselves, of that round-arched, "Romanesque" manner which was the common inheritance from Rome of all western Christendom. The so-called "Saxon" style which it displaced, as we know from still-existing small examples, was a more primitive branch of the same common stock; more primitive, not only because it was wrought with a ruder hand, but because it showed less divergence from the early Christian pattern of the south.

It was displaced, I say, by its Norman sister, but not suddenly and for a time not entirely. Even long after the Conquest the old English manner seems to have guided in lowly structures and remote localities; and its influence somewhat modified even the largest and most nobly placed. Insular Norman work is very like continental Norman, but it is not quite the same.

That cruciform ground-plan which had been unknown in any land in the very earliest ages of the Church, was already well established when William crossed the sea. Our cut on page 724 of the plan of Norwich (which has suffered less alteration than any other Anglo-Norman cathedral) will show its principal features,—the long nave with its aisles to right and left, the transepts forming the arms of the cross, and the choir forming its upper, and always its eastern, extremity. This was the plan of a large church in the eleventh century; and it survived through all later ages, essentially the same, though with modifications that were nowhere so boldly made as on English soil.

In our second illustration we see the interior design of a great Norman church,—the piers supported by massive piers or pillars marking off nave from aisle; then the triforium-gallery above; and then the upper range of windows standing free above the aisle roofs and called by the expressive name of clerestory.

With the roof the first insular peculiarity reveals itself. In the eleventh century the Norman church at home was roofed throughout with vaults of stone; but the Anglo-Norman had its wide central spaces covered by a flat wooden ceiling. Vaults were used only above its narrower aisles.

Should we lay this divergence to timidity, to the mechanical incompetence of those native workmen who must have labored for the foreign artist? Perhaps; but perhaps more truly to a strange incorporation of tastes native to the soil. For a love of wooden ceilings was ever after singularly characteristic of the island architect. Though he could not but yield largely to the nobler titles of the vault, yet he often simulated the stone forms of this with wood; and in the very latest and, mechanically speaking, cleverest days of Gothic art he frequently built instead a highly decorated open timber roof—not, it is true, in his greatest churches, but in his smaller ones and in his vast and splendid civic halls.

The exterior of a Norman cathedral was very long and comparatively low, its outline diversified by the semicircular eastern apse, by a great square tower above the crossing of nave and transepts, and usually by two smaller towers flanking the western or entrance front. Norwich is the only cathedral which keeps its Norman central tower unaltered; and no crowning spire of so remote a date survives.

The great tower was open to the eye as a "lantern" far above the level of the other ceilings, and the four huge angle-piers and tremendous arches which sustained it both relieved and emphasized the long perspective. Ornament was more profuse in the later than

in the earlier periods of the style, but was always more profuse in smaller structures than in the very greatest. Though the fact seems curious at first, is it not in truth quite sensible? Are not vast proportions, structural features on a magnificent scale, so effective in themselves that they have comparatively little need of superficial decoration? The doorways were the most highly ornamented features. Here rude but picturesquely "telling" figure-sculpture and thickly woven leaf-like designs mingle often in rich luxuriance. And though within the building the strong capitals and vast arches are sometimes severely plain or are emphasized with sculptured patterns that are simple, primitive, almost barbarically bold and few,—great zigzags and billet-moldings cut, in the earlier examples, with a mere clever hatchet and not a chisel even,—we must not forget that the whole interior, now scraped to stony whiteness, was originally plastered and covered with designs in color.

VI.

BUT if even Norman work had its insular peculiarities, these were far more strongly marked when, with the dawn of the thirteenth century, the round arch gave place to the pointed, and what the world with obstinate incorrectness call "Gothic" architecture started on its splendid course. The why and the how of the advent and adoption of the pointed arch could hardly be discussed just here. Nor can we pause over the vexed question whether in England or in France was seen the first "complete" development of the style it ruled. The word "complete" admits of too many interpretations dependent for their understanding upon a knowledge of too many details. It is sufficient to say that though in France* without a doubt the pointed arch was first coherently and consistently used to the exclusion of its rival, and though the idea of its use came without a doubt from France to England, yet England's first expression of the new idea, first development of the new system, was singularly logical and complete and singularly individual too. So different indeed was her early treatment of the pointed arch from its early treatment elsewhere, and from her own later method (which was far less individual), that she may fairly claim to have one style more to show than any other land. Her "Lancet-pointed" or "Early English" style stands, lovely and perfect, midway between that Norman and that full-blown Gothic which, on the mainland, passed into

each without any such clearly marked halting-place between. England, that is to say, developed a perfect pointed style before she ever essayed to use the *window tracery* which elsewhere was attempted almost from the very first. In the beginning she built her pointed windows very tall and slender, and grouped them together in diverse ways without actually uniting them as the traceried lights of the typical Gothic opening. It is true that Lancet windows were used in other lands, but nowhere as they were used in England—nowhere so variously, so magnificently, so exclusively as the ruling features of a style which was perfectly balanced, perfectly homogeneous, perfectly distinct from the next to follow. Lancet windows there were in other lands—but no true Lancet style.

All proportions, all features, now grew in height and slenderness. The massive round or rectangular pier became lighter and was set about with smaller shafts, in more or less intimate union, to form a reed-like group. The capital abandoned its square top or abacus for a circular one. The chisel showed a marvelous new skill and a wholly different choice of motive in the infinitude of deep-cut moldings which defined the graceful outline of the arch, and in the crown of quaint, non-natural, but lovely curling leaves which was set about the capital. And the pointed vault replaced the primitive flat wooden ceiling, the aspiring lines of the supports finding their completion in its ribs.

Conspicuous too with the advent of the thirteenth century is the alteration of the ground-plan. In the first place the eastern arm of the cross becomes much longer. This change—a characteristically English one—is the architectural expression of the growth of saint and relic worship. No great "house" was so poor in history but that it could supply some local sainted founder, patron, bishop, martyr, when the popular love of pilgrimages was at its height; and none was so blind to the chance of spiritual profit and temporal wealth and glory but that it could perceive the obligation to give him noble sepulcher. The crypt beneath the choir had sufficed in earlier days; but now behind the high altar in the choir itself his bones were laid in greater state, his relics shown in a more splendid pageant, and his miracles performed in presence of far vaster throngs of worshipers. And thus the eastern arm was obliged to stretch itself out to a length which has of course become wholly useless under the changed conditions of our unemotional time.

When speaking architecturally we can hardly help always calling this eastern arm "the choir." But in Norman days it did not hold the true choir, the "ritual choir," the place set apart for

* When I say France of course I do not mean Normandy. It was the Ile-de-France, the *domaine royal*, which led the world's advance in pointed architecture.

TWO BAYS OF NAVE, INTERIOR, WINCHESTER CATHEDRAL.
(PERPENDICULAR STYLE.)
FROM SHARPE'S "SEVEN PERIODS OF ENGLISH ARCHITECTURE."

those who performed the complicated choral service. This true choir was a fenced-in space beneath the lantern, extending sometimes far into the nave, and closed to the westward — closed off from the lay congregation — by a massive screen. Beyond this ritual choir, in the short east limb, the "constructive choir," was the presbytery for the higher clergy, the sanctuary and high altar. Such arrangements occasionally persisted even down to the most recent day. But usually, at one Gothic period or another, the screen was moved back till it stood between the angle-piers beyond the transepts; the singers' inclosure, with its rows of stalls, stretched further eastward from pillar to pillar, leaving the aisles free on either hand; and the ritual choir became a part of the constructive.

An English impulse it was which then sometimes threw out a second, smaller pair of transepts eastward of the larger — perhaps to give fresh architectural voice to the ritual distinction between choir and presbytery. The long east limb and these doubled transepts show in our plan of Salisbury (p. 727); and there we see still another English innovation and a most important one. The circular termination — the

apse — with which the Norman finished the eastern limb, and often the transept ends as well, was retained, only altered into polygonal shapes, all through the middle ages in all continental countries. But already in the early thirteenth century it was abandoned in England in favor of a flat east end with great groups of lofty windows; and this device (the windows varying of course) was ever after as persistent, as characteristic in England as was the apse elsewhere.

Whither are we to look for the explanation of so marked a difference in times when no nation built in self-contained privacy, but each helped the other with ideas and inventions and often with exported artists too? Doubtless, once more, to the singular persistence of ante-Norman tastes; to the singular strength of preferences native to the soil, inherent in the air, suppressed so long as the dominating Norman was still an alien in the land but ready to reappear so soon as his acclimatizing had been brought about. And if we may believe the logical-seeming deductions of certain careful students, this ante-Norman influence was ante-English even; the true first-birth of the flat east end must be looked for in those little Irish chapels which are the only relics in the whole island realm of the days when the whole island Church was *British*.

A love of longitudinal rather than of lateral extension was very marked in the English builder. It showed itself not only in the unusual length of the choir, but also in the fact that beyond this choir he almost invariably built out further chapels of no inconsiderable size. "Lady chapels" they were most often — dedicated to that Holy Mother whose cult, like that of all lesser saints, received so potent an impulse in the twelfth century. Sometimes they are of the full height of the choir itself, forming part and parcel of its fabric proper. But more often they are lower buildings, into which we look through the main arches of the flat choir end, but above the roof of which this end rises far aloft with its vast windows and its gable finishing the true body of the church. But, as we see again from the plan of Salisbury, all the minor terminations are flat as well as the main one. The apse has disappeared altogether, only to be resuscitated now and then in works where foreign influences guided.

VII.

GRADUALLY — nay, rapidly, in less than a century — the Lancet-pointed gave place to the full-blown Gothic, commonly, but not very sensibly, named in England the "Decorated" style. Window tracery was now developed,

passing through its successive stages as "plate" and "geometrical" and "flowing"; and the sculptor went more directly to nature for the more varied patterns of his leafage. Now, as I have hinted, the scheme of the island architect was very nearly that of his foreign brother. But his peculiar ground-plan preserved its difference, and in certain matter of proportion and of exterior feature (as we shall see hereafter) in this as in every epoch he was markedly himself.

And when the purest time of flowering was over, when each great building nation entered upon a period which, though still vigorous, though still admirable, and indeed more luxuriant than any other, was nevertheless a period of incipient decline and in a certain sense of exaggeration and a pushing to extremes, then the English architect became again more wholly individual in mood; then, in truth, insular peculiarities were more strongly marked than ever in the past.

Late French Gothic became incomparably exuberant and unfettered — twisted and wove its window traceries, for instance, into such flame-like, wavy, stone-denying forms (see cut, page 734) that its name, *Flamboyant*, is picturesquely lucid. But late English Gothic stiffened into a fashion which is just as excellently termed *Perpendicular*.* The mullions of its windows almost abandoned their curves and were cut across by strong horizontal transoms; and the panel-like forms thus produced were carried over as superficial decorations upon the wall spaces between. And while in both countries the arch was taking on a wide variety of complex shapes, its most characteristic shape in France was the reversed or "ogee" curve and in England the low "four-centred" — the former somewhat over-free, the latter somewhat over-rigid in expression.

VIII.

IN the contrast of these two styles — produced at that late day when art was least reserved, least temperate, most individual and willful and therefore most perfectly expressive of national prepossessions, of local aspirations, gifts, and failings — we seem to see in English work what may be called architectural prose and in French work architectural poetry. The prose is very sensible and very clever and often extraordinarily majestic; supremely scientific in construction and in its details very gorgeous. But it is without that indefinable accent of purely æsthetic feeling

which breathes from the poetry of France — seductive, imaginative, full of passion and fire, though now run a little wild, grown a little over-daring, over-fanciful, and freakish.

And the same qualities which come out most strongly in this latest epoch somewhat mark, I think, all the developments which had gone before. There is nothing more entirely characteristic of English architecture through all its many phases than its *love of lowness*; or, if this be too strong a phrase, its neglect of those magnificent effects of interior height which French Gothic loved more than aught besides. That love of wooden ceilings which reappeared from time to time may perhaps be taken as a sign and symbol of that love for *low* ceilings which persisted always, no matter what the forms and material used, and was paralleled by a love for low-pitched roofs above. In this national instinct against extreme elevation (extreme elevation meaning, of course, very daring constructive processes), we seem to read signs of a national spirit of caution and self-restraint and practical common sense — a trifle prosaic, I say, in quality — as incarnate in the English architect; a spirit

"PERPENDICULAR" WINDOW, WEST FRONT, NORWICH CATHEDRAL. (INSERTED IN NORMAN WALL.)

shores which at all resembles her Perpendicular. I need hardly call attention to a point which is clearly shown in our illustration, — the way in which the old, lofty, open triforium-gallery has now shrunk and changed its character.

* Here we find the converse of the facts I noted with regard to Lancet features. Flamboyant windows may be seen in England's Decorated work, but she never used a homogeneous Flamboyant style. On the other hand, there is nothing away from her

FRENCH FLAMBOYANT TRACERY, ROUEN CATHEDRAL.

which is in strong opposition to the audacious, experimental, emotional, imaginative impulse of his Gallic brother.

Yet, somewhat more prosaic though it is in general temper and idea, English architecture has certain attractive qualities quite peculiar to itself. Less imaginative in its main constructive programme and also in its decorative details—for figure-sculpture plays an infinitely less important part in English work than it does in French—it was, on the other hand, less strictly molded by precept and precedent and authority. The art of England in every age and in every branch—architectural, pictorial, poetic—has shown less tendency than has the art of France to crystallize into homogeneous schools, to formulate ideas and aims and tastes into well marked schemes, and to follow those schemes with general accord. Hence many of its defects; but hence also a persistent revelation of individuality which is certainly not without its charm. We may prefer the French architecture of any given epoch to its island rival; but when examining their several results we find that the latter gives us more variety within its own especial limits. It is not so easy to pick out a *typical* English church as a typical French one; and if this fact means something less in the way of perfection, it means something more of “the element of the unexpected.” And few of us have so tender an artistic conscience—at least when shod with our pilgrim shoon—that we cannot delight ourselves in novelty solely for its own sake.

Again,—and this time I note a more indisputable excellence,—while the general proportions beloved of English architects give us less of beauty from one point of view, they give us distinctly more from another; they give us less beauty inside the church, but much more without. The Frenchman loved height and breadth, but before all height—a hundred and forty feet from the floor he sometimes closed the vaults of his greatest naves. But the Englishman loved length most and cared least of all for height—built Salisbury, for example, with a length of four hundred and thirty feet, and gave it a ceiling that rises only eighty-one. Westminster Abbey (which, by the way, is really a French building in a foreign land) is, with its one hundred and one feet, the loftiest church in England; and frequently the other large churches measure even less than Salisbury or than York with its ninety-two feet. Ninety or eighty or even seventy feet may sound tremendous to transatlantic ears; may even look tremendous to transatlantic eyes which are taking their first lessons in the majesty of ancient art. But imagine what such a height must mean if *doubled*; or go to the Ile-de-France, or to the Gothic churches of Normandy, or to Cologne (which, again, is a French church, though not on Gallic soil), and see what it means. See the extraordinary beauty, the extraordinary sublimity of such proportions; feel their mystery, their poetry, their overwhelming impressiveness—spiritual, emotional, and not coldly intellectual in quality. Height, in truth, in an interior, is the great enchanter, the great soul-subduer, the great poetizer and awe-inspirer. Length is seen and understood and valued at its worth. Height is *felt*; and the longer we submit ourselves to its influence, the more mysterious, the more bewildering, the more supernal it remains.

If you have seen such things and felt such things before you go to England, there is disappointment in store for you; there you will not find their like. But if you make acquaintance with England first, why, then there is disappointment of another kind awaiting you across the Straits. It is not only that the English cathedrals are very beautifully placed. They have also an incomparable external beauty of their own; and this, I say, by virtue of their very lowness.

More than a hundred feet of height means, outside a church, that the noblest towers seem dwarfed and the loftiest spires seem stunted and the greatest length seems all too short; and means, moreover, a very conspicuous use of flying-buttresses. Used in moderation, no architectural features could be finer; but used to excess, used everywhere in close succession and carried up story after

story, arch within arch, flight over flight, as in so many continental churches, they are more wonderful to the scientific eye than delightful to the artistic. Seen near at hand, it is true, their intricacy, their boldness, their beauty of form and detail, or the mysterious effects of light and shadow their intricacy works, cannot but enchant. But from a little distance, when we view the structure as a whole, they seem not so much to help the walls as to do all the work that walls should do, not so much to give the church stability as to confess its lack thereof; seem less like an intrinsic part of the fabric than like extrinsic props and stays, like stupendous after-thoughts or vast temporary scaffoldings. In many of the tall French churches the huge body is majestic through size alone and not through beauty; seems shapeless by reason of ungraceful proportioning and also by reason of the many buttresses which confuse its outline and conceal its features.

But perhaps the best thing about the long, low sky-line was the way in which it permitted the English architect to give his towers extraordinary dignity, and, moreover, to keep the central one supreme. The tower above the crossing where nave and choir and transepts meet was always supreme in Norman days; but as the Gothic body grew tall in France, this tower inevitably dwindled in the same proportion, dwindled into a mere lantern or spirelet while its whilom subordinates, flanking the western front, usurped its vanished glory. But in England it kept more than its early size and all its comparative importance; and though, as we shall see, the west front suffered by the fact, yet the composition as a whole profited vastly both in beauty and expression.

I should note, however, that it was not only the lowness of the English church which helped the central tower to its full development; its narrowness, which also seems a fault inside, was a fortunate circumstance without, for it permitted, nay, compelled, the transept arms to spread far beyond the line of nave and choir; and their projection meant for the tower that firm lateral support the eye demands. Thus through the spreading of his transepts and the soaring of his central tower the island architect gave his exterior at once more symmetry, more unity, and more variety; gave it a pyramidal shape in which all parts and forms led up to a dominant common center, and gave it equal beauty from every point of view. And, I repeat, the gain is expressional

as well as artistic; for the greatest emphasis is laid not on the west front, the mere place of entrance, but on that vital spot which is the very heart of the great architectural body.

IX.

OF course I have been marking extremes. Of course there are many French churches very beautiful without, and certain English churches much too long and low for true perfection. But all the same, English excess is less painful to the eye than French, English perfection still more perfect, and the English average beyond a doubt more charming. As a general thing, I should say, the English exterior is almost, though not quite, as superior to the French as is the French interior to the English; or I will be a little bolder and say *quite*, if I may reckon up not only its intrinsic merits but also those extrinsic lovelinesses of environment wherein no other land can dare set up a counter-claim to England's.

Yet, after all, we need not greatly concern ourselves with the nice weighing of counter-claims. To enjoy them all we must recognize all diversities as such, but without trying to hold a critical balance true between them—simply being glad that they exist. Why, indeed, should we, pilgrims from afar, whose grandsires bought us better blessings at the sacrifice of our artistic heritage, feel bound to criticise the fact of its very richness when we turn back a moment to study what it was? Why should we ask which is better—complete interior, complete exterior beauty? Surely the best thing possible is that we should find one here and the other there. Why should we quarrel over the greater virtue of apse or no apse? Surely it is well that we have now the shadowy mystery of circling aisles and chapels and again the great square east wall—at Ely with its Lancet groups, at Wells with its arched vista into lower further spaces, at Gloucester with its vast translucent tapestry of glass. The more variety, since variety means different virtues, different charms, and not different degrees of one success, the better, I say, for us who are mere lovers of loveliness; whatever may be the case with the pedant or the Puritan in taste, or with the responsible professor bent on theoretic preachments, or with the practical student forced to choose a text for his own new effort amid the rivaling suggestions of so many varied rhapsodies in stone.

M. G. van Rensselaer.

CAMPING OUT IN CALIFORNIA.

CAMPING OUT is a common family amusement in California; but when our party took to the woods the experiment was regarded by friends with curiosity and some mistrust. We had chosen a very difficult country, and yet we meant to live in unusual comfort. We were going into the mountains of southern California, far from roads or settlements, and our scheme was to carry into this wilderness all the equipments of a modest summer home, and to live there for a few months with a degree of luxury which the guides had never seen in such a region. Our attempt was entirely successful. The camp was maintained in excellent style for ten weeks, and was then abandoned only because there was no more forage for the horses. In these pages I purpose telling how we lived without hardship on a remote mountain, hunting, fishing, exploring wild places, and idling in the shade of the pines.

We were five comrades, including one lady, and we were served by a guide and a Chinese cook. Our point of departure and base of supplies was the little hamlet of Nordhoff, which lies in a mountain valley full of live-oaks and flowers, fifteen miles from the coast and forty miles from the town of Santa Barbara; and our objective point was a long ridge called Pine Mountain, which rises boldly to a height of six or seven thousand feet among branches of the Coast Range, twenty-five or thirty miles from Nordhoff.

The mountain can only be reached by a rude and arduous bridle-trail, so little traversed that in many places it is nearly lost in the woods and chaparral; and the serious work of our expedition was to pack our abundant luggage on horseback over this path, and to get fresh supplies at frequent intervals by the same route. I say frequent fresh supplies, for we determined at the outset not to depend upon the coarse bacon and canned provisions which form so large a part of the ordinary campers' fare. Our load when we started was not less than one thousand five hundred pounds, including tents, bedding, cooking utensils, tableware, clothing, and about ten days' rations; and as a good burden for a horse on a hard mountain trail is two hundred pounds, we had enough to pack at least seven animals, besides the seven for our own riding. But a train of fourteen horses was more than we could eas-

ily subsist on the road, nor did we wish for the care of such an extensive stable. We moved, therefore, by short marches in two divisions. The guide went first, with four baggage horses and two riders, and as soon as camp was pitched for the night he returned for the rest of the party, driving all the horses in a string before him. The next day the rear division closed up with the advance. In this way seven horses were made to serve for the whole work. It is true that the guide and the animals had to go over the entire route twice, and that we made slow progress; but we were in no hurry; and some of the pleasantest days of our summer were those we spent on leisurely marches or consecrated to rest for the tired beasts.

Happily we were able to make our first start with becoming parade and in one imposing body; for there was a wide wagon-track leading from Nordhoff a few miles into the mountains, and we made use of this to have our baggage transported on wheels as far as we could, while we rode after it in a picturesque procession. It was a little after sunrise on a bright morning in early June, when Soper, the stalwart and good-natured guide, drove into the yard at Nordhoff, with a stout farm-wagon, and began to pack into it our bales and bags, while the gentlemen, coatless, in flannel shirts, rough trousers, and leggings, and the lady, in a dress of striped canvas, suitable for riding astride, busied themselves with their horses, and prepared the bundles which were to be strapped to the saddles. We were all ready, when we missed the cook. "Hing! I say, Ah Hing!" shouted everybody; and presently the placid Chinaman came up from the cellar, carefully holding in both hands a wide-mouthed, uncovered jar containing some sloppy substance which spilled a little at every step. "Come, Hing! it's time to go. Where is your baggage?"

"Where my baggage? This my baggage."

"No, no; I mean your clothes."

"My clothes, I give him my brother. Got no baggage only this."

"Why, you can't take that up the mountain. What is it?"

"This yeast; oh, I make yeast. Bakin' powder no good; no make good blead. I make yeast, make blead. No blead, all same, no eat. Oh, I make heap good blead." And then he added, addressing himself to the lady

with a childlike smile, a bow, and an impressive wave of the hand, "Damn good bleed."

It almost broke his heart to give up the jar; but he saved a bottleful of the precious leaven, and mounted with it to the top of the luggage, where I believe that not more than half was spilled on the mattresses during the journey to the first camp. And so our merry party, with much cheering, and with handkerchiefs waving from windows and doorways, rode out of the village.

But I have forgotten the cow! When we first spoke of taking a cow into a mountain camp, people thought we were joking. Then they came to the conclusion that we were rather "too fresh" for California. But we saw no reason why a cow could not go where a horse could go; and Soper, being consulted, gave the plan his entire approval. The handsome and amiable little Jersey which we thereupon chartered for the expedition proved one of the most valuable members of the company, and gave us no serious trouble. Two or three times, indeed, she slipped away, and started for home with uncommon energy, like a cow that knew her own mind; but the very clearness of her purpose made it easy to find her, for she kept in the trail, and, though she traveled fast, we always caught her after a moderate chase. If she had reached Nordhoff, I do not know whether we should have cared about reclaiming her at the cost of facing the hilarious villagers.

We cantered across the upland, through fields of grain which brushed the horses' shoulders; we threaded a live-oak wood, where all the ground under the trees was dotted with brilliant flowers; and when we reached the wall of mountain which bounds the valley on the north, we found ourselves at the mouth of a rough and burning ravine called the Matilija Cañon, strewn with bowlders, faced by bare rocks or thinly clad hills, and populous with horned toads, rattlesnakes, and other interesting reptiles. This was the forbidding gateway to the picturesque region we had chosen for our camp. A rapid brook runs down the cañon, shrinking into the deserted bed of what must once have been a broad river, and here and there the gravel spreads far over the desolate bottom. But soon after entering the ravine, the eye is relieved by patches of wood and verdure which at short intervals break in upon the sand. The rocks, taking imposing and fantastic forms, nearly close upon the trail, which crosses the stream repeatedly, as it is crowded from each steep bank in turn. Even the rudest stretches of the Matilija are famous for their flowers. The glory of the meadows and barley-fields, of which all travelers in this gorgeous State have said so much, was fading when

we began our journey, but in the Matilija the blossoms linger later and attain a richer color and an ampler size than in the open country.

The brush was all in full flower as we rode past; a wilderness of sage burdened the air with perfume; many of the slopes were vast masses of blue and yellow bloom; and myriads of bees so filled the valley with noise and excitement that I could only think of the Matilija as a great honey-factory. The wagon-track, in fact, was made for the convenience of a few bee-ranches set up here in the midst of the chaparral (one of them belongs to our guide), and at the bars of the last of these rude inclosures the mark of wheels comes to an abrupt end.

We made our first halt near the head of the Matilija, where a flat basin among the hills, with a grassy bottom fringed by sycamores and willows, a thicket of alder on the banks of the stream, and a profusion of flowers at every turn, made a tempting spot for the pitching of our camp. We turned the horses loose, and while the lady and the cook prepared our first meal, the rest of us unloaded the wagon and opened bales and boxes. We established the Chinaman in a commodious kitchen, consisting of a willow-tree, a sheet-iron stove, and an open fire for the kettle; and presently we were seated on the ground disposing of a miscellaneous picnic lunch, to which exercise and exhilaration contributed great appetites. We had a merry and busy afternoon, setting up our tents on the edge of the wood; building a dinner-table (for which we brought the top in short sections of light half-inch redwood), and spreading an awning over it; cutting branches for our beds; making rustic shelves around the trunks of trees; and arranging our stores. A late dinner of steak and potatoes closed the day, and we went to bed tired and happy.

We spent two weeks in this pleasant camp; and how short and delightful were the days! There was no worry about weather, for between May and November no rain ever falls in this region; and although the sea fogs sometimes reached us at night, the days were always bright, the heat was moderate, and we were high enough above the ocean-level—one thousand eight hundred feet—to catch fresh breezes that were not felt in the valleys below us. A cold spring tumbled into the brook a few rods from our tents. In mid-stream was a shady island of smooth gravel, where the gentlemen spread their rugs in the afternoon, smoked, and read novels; and there was a clean, deep pool in which they bathed. Fishing was the principal sport, for the Matilija abounds with trout. Every morning before light two or three of our party crawled from their couches, took a

slice of bread and a draught of milk at the willow-tree which we called the pantry, and were ready at the first glimmer of dawn to whip the stream. Every evening after dinner they took their rods again and fished as long as they could see. Sometimes they made all-night excursions to the upper waters of the Matilija in the mountains, and followed them down to the camp. There was a flavor of adventure in these expeditions into the dark and lonely woods, with the suppers of bacon and freshly caught trout, and the late lingering over the camp-fire coffee; but the fishing was quite as good near home. The Dolly Varden trout, which is caught in these California brooks, is named from the brilliant and varied colors of its sides and belly. Certainly it is gayly and coquettishly adorned; but it does not excel the exquisite speckled trout of our own waters either in beauty or in flavor, nor will it rank very high as a game fish. No special art is needed to take it; worms, flies, grasshoppers, bits of bread or of meat,—it swallows them all with indiscriminating appetite. If it has any preference in the matter of diet, it is for the eyes of its own companions. When other bait ceased to allure, we used to put a trout's eye on the hook, and the sport revived. I think that with a few accidental exceptions we had trout at every meal as long as we remained in this camp. Farther up we afterward found still finer fishing. There was a spot on the left fork of the Matilija where the doctor and the Chinaman, resting a day on the march to the mountain, hooked trout almost as fast as they could throw their lines. Here Ah Hing performed his great exploit of catching forty-eight fish with one worm, which has always seemed to me the most remarkable illustration of Chinese thrift in my experience. There is no doubt about the fact; no worms are found in the arid valley, and as our supply, brought from Soper's ranch, was small, the doctor put Ah Hing on an allowance of three, two of which he afterward returned.

Venison was scarce at our first camp, and although the guide and two or three of the most earnest of the party made long marches and spent watchful nights on the mountains, they saw only one deer, and him they did not kill. The deer-hunting was to come later. There was other game, however, in plenty. Wild pigeons abounded; and the beautiful crested valley quail—a much handsomer bird than our eastern bob-white, but not such good eating—could be got with very little trouble. We had no dogs, but we seldom lost a bird, and our larder, a convenient branch overhanging the pantry-shelves, rarely lacked the materials for a pie. Nobody seemed to make

a business of gunning. It was the recreation of odd moments—I was going to say of idle moments, but we were always idle in those happy halcyon days. When a man was tired of his pipe and his novel, he strolled into the grove or up the cañon, and came back presently with a good bag. Even the cook took his share in this easy sport; but to him, unlike the others, the enterprise was one of wild excitement. He crept after birds with the stealthy tread of a cat. He never risked a long shot, and never was quick enough to fire both barrels, but his luck upon the whole was very fair, and when he returned the hills echoed with his exultant cry, "Ho, I catchum pigeon—t'ree, four pigeon!" He brought in rabbits also, for the stewing of which he had a great knack; and we recognized the shout, "Ho, I catchum labbit!" as the prelude to a savory dinner.

Guides and ranchmen and hunters told us stories about bears in the neighboring hills—not very near us, for bears are like chills and fever: they never have them just here, but only on the other side of the valley; yet there was an element of the grotesque as well as the marvelous about these tales which disposed us to skepticism, and even the lady slept secure. There was a hunting party on one of the forks of the Matilija, in whose camp one of our fishermen had been hospitably entertained at breakfast, and on the march to the mountain we met these men going home. They had the skins of a black bear and two cubs: they shot a cub by accident, and this led to a difficulty with the rest of the family. But our guide, who hardly felt that anything less than a grizzly ought to be called a bear, treated the adventure with contempt. He rode on in silence for some time, and then he gave a short, scornful laugh. "I don't call that any kind of bear-shooting. *Black* bears!" Further back in the mountains we talked with a French lad who was tending sheep. He had built his bed eight feet above the ground, with the foot of it resting against a tree, which served him for stairs, and he told us that he did this on account of "the bears."

"Bears? What kind of bears?"

"I don't know how you call them in English; they are about so long"—indicating three inches. We never found out what he meant.

When the forage began to fail we broke camp and entered upon the difficult part of our march. We had come to the end of the road, and the mountain trail which lay before us was so rough, so steep, so crooked, and so much overgrown that the pack-horses had to be loaded with extreme care, lest a too prominent pot or projecting broom-handle, catch-

ing in the brush or striking a rock, should throw them from the insecure path. When the last of us, after an early breakfast, rode out of the dismantled camp, we looked back with a sentimental regret upon the shady thicket, the acres of flowers, and the rustic chairs and tables left as relics of the occupation. We should have been melancholy indeed if we had known that the spot would never look beautiful to us again. When we returned at the end of summer, the hills above it had been swept by fire, the axe had been laid to the trees, and an adventurous ranchman was clearing the land for pasture.

A little way above the camp the Matilija Cañon splits into three narrow ravines, each traversed by a fork of the stream, and each shut in by high mountains. Our route lay up the pass on our right hand, and after we had twice forded the water we turned sharply at the foot of a projecting height, and began to ascend. We twisted and doubled so often around spurs of the range that we soon lost the points of the compass. The trail kept close to the brook (when it was not actually in the brook), and indeed there was no room for it elsewhere. We threaded defiles, we crept through dense copses, we bent low over the horses' necks to penetrate stretches of wood, we forced our way through the bush by main strength and left rags fluttering on the thorns; now and then we crossed a broad, flower-spangled basin, or trod a treacherous path on the sandy flanks of a mountain amphitheater. Grandeur of outline, splendor of color, and variety of character are the distinctive charms of the California hill-country, and in this entrancing journey we had a rapid succession of pictures not less remarkable for their contrasts than for their beauty. The ascent was steady and rapid, and whenever we came to a clear height we looked back in surprise at the cañon below. Sometimes a magnificent vista of blue mountains and broad valleys suddenly opened before us, fading in a hazy and mysterious distance; and when we reached the crest of the divide which separates the head-streams of the Sespe and Ventura rivers, we turned and saw beyond the mountains the Pacific Ocean like a pale mist. The journey was principally a scramble, and the lady had ample reason to applaud the sagacious guide who advised her to use a man's saddle; a side-saddle would certainly have brought her to grief. The last stage of the ascent of the divide — an unnamed portion of the Santa Ynez range — was a terrible climb of about two thousand feet through stunted shrubs. We had hardly breathing-time on the narrow top before we plunged into a dark pine wood, and began an equally deep but more gradual

descent. The gloom of the forest was intensified by the blackened remains of burnt trees. Nearly half the timber had been scarred by fire, and much of it killed. Mighty trunks, six feet in diameter, lay stretched along the ground. Here and there the fires were still smoldering. Looking forward we sometimes saw sunlight on the foliage in the distance far below, but our somber path through the black valley was like one of those weird scenes beloved by Doré, in which dense shadow lies under towering, gigantic branches. At the foot of the ravine we issued into a broad, hot, sandy valley, overgrown with tall grasses; and in front of us, parallel with the range we had just crossed, stretched the long ridge of Pine Mountain, upon which we were to pitch our final camp. After we had crossed the valley we had a hard climb of three or four hours, first through a narrow gorge, and then along the crests of the outlying ridges; and at last, in the heat of the afternoon, we reached the grateful shade of the pine-covered summit, and rode in a beautiful open wood, free from undergrowth, where the eye lost itself in innumerable charming vistas beneath the lofty boughs.

We spent a week on the road from our first camp to the mountain. Once we set up our tabernacle in a group of bay-trees, and made our beds of the fragrant branches. Again we halted in a copse by the Sespe River, where we caught trout of prodigious fatness, and refreshed our horses in a succulent pasture, while Soper went back to Nordhoff for supplies. We did not pitch our tents during these wayside stops; we spread our blankets under the trees, and reduced the art of living to its simplest elements, so that the packs should not be disturbed more than was necessary. Even after we reached the mountain, it was ten days before we resumed the luxurious habits of our camp in the Matilija. We went first to a deep and narrow glen on the south face of the mountain, where a beautiful spring of water issued from a cave; but this spot had no recommendation as a camping-place except the water, and we presently settled ourselves on the summit. Here we had incessant breezes, abundant shade, space, variety, verdure, forage, and a superb outlook over valleys and mountain ranges, with the sea and its islands in the distance. But, alas, we had no water; that had to be brought from the glen, about a mile distant, the trail comprising a breakneck ascent of five hundred feet which was much worse than anything we had passed on the journey. If we had realized the full extent of the water difficulty before starting, we should have directed our expedition elsewhere; and indeed I must confess that in

many respects Pine Mountain, as a camping-place, is open to objections. I will not rehearse them all, for I am more concerned to show how one can live comfortably in camp than where one can so live. Having determined to pack water from the spring to the summit, we obtained four square tin honey-cans, each holding five gallons; they were furnished with screw-tops, and were set in two oblong wooden boxes, to which cords were attached for lashing them to a pack-saddle. A horse-load was thus twenty gallons, weighing, with the boxes, nearly two hundred pounds, and we used, with great economy, three loads in two days. Getting water over that nearly impossible trail was hard work for both man and horse, and it made a dreadful inroad upon the day, especially when it happened, as it often did, that the horses could not be found when they were wanted. The horses ran loose all over the mountain-top, and though they often wandered far, they never went down into the valley, or let more than a day pass without paying us a friendly visit.

Soper got the water-vessels for us the first time he went down for supplies, and as soon as they arrived we moved our camp. The spot we chose was a gentle slope looking toward the south, well-shaded by an open growth of huge white pines, quite clear of brush, and reaching in front to the edge of the mountain, while in the rear "big bunches of rock," as our guide called them, divided it from a beautiful little depression in the very crest of the ridge, and from the denser growth of timber which extended thence down the northern slopes to the foot of the range. The parallel ridges in this part of the country, running east and west, are thickly wooded on their north face, and treeless on the south. From our mountain-top we could look both ways. I never got used to the startling change in the effect of the landscape produced by merely turning around. But in one respect it was all alike: neither on the side of the dark-green forest nor in the melancholy quarter of bare red hills and sandy wastes was there a sign of human life—not a house, nor a fence, nor a road, nor a tilled field.

In the midst of our grove we set up a capacious table, which not only served us for meals but marked a place for social gatherings. We leveled a broad platform, raised a stout awning-frame, made benches of split logs, and built on the north, or windward side, a thick screen of wattled hemlock branches, which we hung with sundry housekeeping articles, and decorated, after a while, with deer-skins and other trophies of the chase. At one side was suspended a vessel of drinking-water; at the other was a little covered fire-place, with

a flue running so far back into the hillside that the smoke would not annoy us. Here we made the coffee and kept the dishes hot, while Ah Hing held undisturbed possession of the kitchen. That department was about two rods distant, in a clump of fine trees, and was nearly surrounded by a wind-screen of hemlock boughs and odd pieces of canvas. With poles, and lengths of split pine, and a few empty boxes, the cook made a dresser and a set of shelves. We had an excellent stove of sheet-iron, highly effective and easily transported. It was about three feet long, eighteen inches high, and eighteen inches wide; it had no bottom, no legs, nothing that would break; the pipe telescoped and went inside; the weight of the whole was eight pounds, and the shape was convenient for packing. On the march we turned the stove upside down and filled it with saucepans and the camp library, this collection of books comprising a large supply of portable literature in the Franklin Square series and similar publications. As an appendix to the stove, we had a deep sheet-iron roasting-pan, with a tight cover; a Dutch-oven served for baking bread and pies, and there was a huge open fire-place, backed with stone, before which we hung haunches of venison too big for the roaster. We built a substantial meat-safe, with sides and top of mosquito-netting. Shelves around the trunks of trees held our other stores, and a close cupboard, fastened to the trunk of a tall pine, answered for a dairy. As it never rained, and insects were not troublesome, our groceries needed no protection except from the sun and the dust.

In our sleeping arrangements there was a great deal of diversity. The different members of the party placed their beds far enough from one another and from the common center to secure a reasonable degree of privacy, and sought, moreover, the protection of masses of rock or groups of trees. We all lay in the open air—all except the Chinaman, who would have his A tent, even on the march, being persuaded that it was a necessary and sovereign safeguard against bears and snakes. Some spread pine boughs on the ground and put a blanket over them; others built rustic bedsteads. The lady and her husband had light wool mattresses, not more than two inches thick, and so flexible that they were easily rolled up for transportation on horse-back. These, placed upon branches of white pine and close top layers of hemlock twigs, carefully set with the cut ends down, made soft, springy, and luxurious beds. Several of us brought sacking to make cots, but the experiment, which we tried only in the first camp, was not successful—the cot-frames broke down,

THE FIRST DEER.

or the canvassagged too much; the pine branches were both simpler and more comfortable. Whether it is better to sleep on the ground or on a bedstead is a disputed point. Experienced friends gave me contradictory advice. Assuming that you lie out-of-doors (for that is by far the pleasanter plan in a dry climate), you will need, if you build a raised bedstead, at least one thick blanket under you, and perhaps two. Even a light mattress will not be a sufficient protection unless you are in a spot much better sheltered from the wind than the top of Pine Mountain. But, while the ground is undoubtedly warmer than a bedstead, it is, on the other hand, very dirty. On such a couch the bedding soon becomes filled with dust and dead leaves and miscellaneous refuse, and you will be fortunate if the vagrant breezes do not deposit much of their burden in your face while you sleep.

A tent is unnecessary in a climate like that of the California summer, but it is a great convenience. There were two wall-tents in our camp, each about ten by twelve feet. F—— used his only for a wind-screen after we reached the mountains. The other was occupied by the lady and her husband as a dressing-room, their beds being placed just outside the open door. They had a floor-covering of striped canvas, pulled tight and tied to the tent-pegs, and under this they spread a thick layer of pine-needles. This gave them the first of all

luxuries in camp life — a clean place for the toilet. The greatest affliction of this savage existence is dirt, and the greatest comfort is a basin of water. Of course when there is a lady in the party, shelter of some sort is indispensable, however fine the weather. Huts can be built of boughs, but to build them properly takes a great while, and for some days after first going into camp everybody is busy with work which needs instant attention. Bough huts, moreover, are but a poor protection from the wind and the dust, and in a mountain country both these visitations are apt to be troublesome. With a tent you can at least be sure of a tolerably tidy retreat, and it is surprising how easily it is carried. Tent-poles we cut in the woods as we wanted them.

Our party hunted in moderation. Two of them took to the woods for the benefit of their health, and those who were better able to carry a gun did not depend upon shooting for their daily amusement. They read, they sketched, they strolled about the mountain in search of the picturesque, they made excursions on horseback to various parts of the long ridge and to the valley below, they lounged and chatted in the shade. The ordinary work of the camp and the construction of chairs, tables, washstands, and innumerable little conveniences gave everybody some occupation. We had a few carpenter's tools, and they were never out of use. We breakfasted at seven, lunched at

HARVEY.

twelve, and dined at six; and when we left the dinner-table we gathered around a large fire in the midst of the camp, and listened to the guide's stories until drowsiness overtook us. Soper, having business of his own on hand, left us as soon as we reached the mountain-top, but he sent an excellent man in his place. The new guide was a very quiet and soft-voiced person, who said "sir" when he spoke to us, while Soper always addressed us as "you fellows." We never decided which was the better guide or the pleasanter companion. Soper was from New Hampshire. He had been a cavalryman in the United States army, and after practicing a variety of handicrafts had now turned bee-keeper. Harvey was an English sailor. He had served for many years as carpenter in the royal navy; what wave of fortune threw him on the California coast I never

learned; but having found his footing there he took to the mountains with an enthusiastic love, and became an expert hunter and woodman. He was an indefatigable walker, a good shot, a model of industry, an excellent cook, and, as might be expected of a ship's carpenter, a handy man at almost everything. At the evening fire he sat on the ground, a little back from the circle, smoking a pipe and intermingling sporting reminiscences with stories of his life at sea, as if in some odd way "The Pilot" and "The Pathfinder" had got mixed up like the babies in "Pinafore." I liked best his tales of the fore-castle. They were not at all exciting; they were novels of character and manners rather than of incident, abounding in "says I" and "says he," and running on indefinitely with a placid and soothing movement which disposed us to peace and content. At the end

Harvey always laughed gently, and we followed him ; but I do not think that he expected this tribute. I dare say that the art of telling stories like these is only acquired on long voyages. Sometimes an element of drollery in the tales, which we missed while we stared at the fire in the sleepy evening, came to us the next day with a new relish. I remember in particular a long and minutely detailed story about a meat-pie, which we heard with serene composure in the course of a protracted sitting. Thirty-six hours afterwards I began to think it funny. With some hesitation I asked my companions if they also found it funny. The idea was new to them, but upon reflection they agreed with me. It has seemed funny ever since ; but only a sailor could tell it with effect.

When we first went to the mountain we meant to send Harvey to Nordhoff every week or so for supplies and the mail. But this journey would have taken three days, and we found that he could not be spared. A young man who worked for Soper at the bee-ranch was therefore engaged to come up every Saturday, riding one of Soper's horses and leading another loaded. The arrival of Brown, late in the evening, was the chief excitement of our life. The lantern was brought out, flaring candles appeared on the table, and we surrounded the old white pack-horse, Blanco, to examine the sacks and bundles heaped upon his weary back. The raw-hide bags which hung from the pack-tree were filled with parcels of tea, coffee, sugar, small groceries, powder, shot, nails, flour, and meal, a can of

honey, a ham, a pail of fresh butter, two or three pecks of potatoes, onions, and whatever young vegetables could be got, and on the load were a few live fowls in a sack, a box of eggs, a box of apricots, pears, and apples, and a plethoric mail-bag. The carrier spent Sunday in camp, and early Monday morning he started on his return with our letters, and orders on the Nordhoff shop-keeper for the next week, and sometimes presents of venison for our friends. We had a few canned meats for emergencies, but we made little use of any of them, except corned beef, which, with the addition of potatoes and onions, furnished a palatable hash. Nor had we need to try our digestions with the coarse bacon which is sold in this part of the country, though we larded our venison with it, and fried it with deer's liver, and now and then for a change served it with eggs. We lived almost entirely upon fresh provisions, carefully and even daintily cooked. Venison was so abundant on the mountain that we were never without it. Our hunters, after the first day or two, which they spent in learning the haunts of the game, never went after deer without killing at least one. At the foot of the mountain were shepherds who sold us lamb and mutton. About once a week some of our party saddled their horses to go marketing ; they returned after five or six hours with a whole sheep, the price of which, skinned and dressed, was three dollars, without regard to age or weight. In the dry air of the mountain mutton would keep five or six days and venison longer. We tried

THE MILKMAID.

getting beef from Nordhoff, but this experiment was a failure. After all, we had variety enough without it. We learned to serve venison in so many ways that we never got tired of it, and though it is but a dry meat by nature, there is an art of giving it juices. It was set before us in the form of steaks from the leg, chops from the loin, breaded cutlets from the shoulder, stews with potatoes and ham, haunches roasted before an open fire, haunches stuffed with minced vegetables (not forgetting onions), smoking and well-seasoned pies, and, best shape of all, brown and tender saddles. I am sure that nobody can roast a haunch better than Harvey. It was a day of grand ceremony when, some majestic buck being ready for the fire, our woodland sailor took command of the kitchen. He made sure that the flesh was in prime condition; he col-

THE ROAST.

lected dry oak fuel, which would give live coals without smoke; he larded the haunch well; he hung it by a twisted string; he basted it judiciously as it revolved; he made a good gravy for it; and he served it hot, with currant jelly. Then he crowned the feast with his greatest triumph, a plum-duff; and, lest that mighty marine pudding should disagree with us, he brought to the camp-fire, when night had fallen, a kettle of boiling water, and the sugar, and a certain bottle intended for snake bites and other extraordinary emergencies.

"Roughing it," in our case, certainly involved no sacrifice of the pleasures of the table. The cow put us in the way of many puddings and other pleasant desserts,

"WHERE THE RED DEER FEED."

and of various cakes and biscuits. Ah Hing was not unduly confident when he boasted of his "heap good bleed," and the artist was an adept in the mysteries of flap-jacks. Here is a bill of fare for a day in July, which may pass as a sample of our table:

Breakfast: Oatmeal porridge and cream; deer's liver and bacon; broiled kidneys; hot biscuit; coffee and tea.

Luncheon: Lamb chops; canned salmon; honey and cream.

Dinner: Soup; haunch of venison; mashed potatoes; pudding.

Crockery and glass being out of the question in a mountain camp, our table service was composed of "agate ware," a very serviceable kind of enameled iron, which is far preferable to tin for such expeditions, being pleasanter to use, easier to keep clean, and proof against rough handling which would knock tin out of shape. It is not very cheap, plates costing us twenty-five cents apiece and cups thirty cents, but when the summer was over, every article was as good as new, and was readily sold. Tin answered well enough for meat-dishes, and we got a decent quality of tin spoons and forks for a few cents each. Upon the whole our table was neat, comfortable, and attractive.

Hunting on the mountain was not without the exciting uncertainty which is essential to good sport, but the difficulty was less in shooting the game than in recovering it after it had been shot. We had no dogs, and the deer always run after being hit, sometimes getting over a surprising extent of difficult ground with a bullet in a vital part. One of Harvey's earliest experiences with us was the loss of a fine buck under circumstances which always puzzled him. He started a buck and a doe on the north flank of the mountain, and hit them both. The doe was easily secured, but the buck, though badly wounded, sprang down the slope and was soon out of sight.

Harvey traced it for some distance. The trail was marked not only by a profusion of blood but by fragments of bone. Suddenly the blood, the foot-prints, and every other sign disappeared as completely as if the animal had been snatched up into the air. A long search, resumed later in the day with the help of a companion, led to no result. The mystery never was solved. Below the spot where the trail ceased there was a precipitous descent, too far, one would think, to have been reached by a wounded deer in a single leap; and yet the only conceivable explanation of the disappearance is that the animal did go over it in one bound. A man could not climb down the

TWO OF THE SHEPHERDS.

rocks, and as any détour to reach the bottom must have been very long and arduous, the quest was abandoned.

An adventure which befell the artist was still more annoying. It had long been his ambition to secure a pair of large branching antlers, and one day he started just the sort of buck he had been looking for. The spot was a difficult slope on the south face of the mountain, and the hunter, having dismounted and tied his horse to a tree, was proceeding

YARNS.

on foot. (I should explain that our sportsmen always rode as far as they could, not only to save the fatigue of a long tramp, but because

they needed horses to bring home the booty.) The buck fell at the first shot, and lay as if dead some distance down the rocks. Thinking that it would be all that he could do to shoulder the venison, M—— turned back to leave his rifle near the horse before he went after the game. He had gone about half-way down the hill, when to his consternation the buck sprang up and plunged into a thicket. Then he had to climb back for the rifle before he could pursue; and although he tracked the deer through brush and ravines for two or three hours, he never got another shot at it. On the way home he secured a doe, but this did not console him for the loss of the largest buck any of us had seen on the mountain.

"I tell you," said Harvey, "don't you ever go near a dead deer without your rifle. I've been caught that way. I shot a big fellow once, and he tumbled right over with his legs out stiff, and never stirred till I whipped out my knife and went to cut him open. Then he just gave a big jump, and was off before I hardly knew what had happened. But I got him, though, afterwards."

We saw little game on the mountain except venison. A few gray squirrels were shot, and there was a legend of a jack-rabbit which at rare intervals flashed upon the sight of men who happened to be out without a gun. In the course of time this elusive creature acquired a reputation like that of the sea-serpent. Reports of its size grew more and more startling. Once in a while somebody who had been roaming at sunrise would come to breakfast with the remark, "I saw the jack-rabbit this morning," in the tone of a visitor in a

AT LONG RANGE.

haunted house reporting, "I saw the ghost last night." Expeditions often went out for the express purpose of shooting that one rabbit. Ah Hing hunted for him with especial zeal. But nobody with a gun ever saw him. Some called him a phantom; others thought him a myth. At last, at the end of summer, when we had broken camp and were going home, there appeared to all of us, in a patch of brush close to the trail, a mighty pair of ears, and presently the jack-rabbit ran slowly across our path. He stopped to look, as our

the neighborhood. One day the artist, coming in from a deer hunt, discovered a mountain grouse in a tree, and brought it down with his rifle. It reached the ground in half a dozen pieces, and he had to bind up the fragments before he could carry it home. It was a hoary and solemn bird, and it seemed a sort of sacrilege to kill a venerable recluse which had probably looked down from its solitude upon a long succession of camping parties. When we proceeded to eat it, we all agreed that it was a pity it had been shot.

GETTING IN THE BEDDING.

train wound down the hill, and when he was sure that we were really going he turned contemptuously, kicked a little sand at us, and went up the mountain.

Pigeons were very scarce at the summit. Quail sometimes appeared there, but all those that we saw had young broods, and we would not molest them. There is a bird called the mountain grouse which can be found on Pine Mountain by those who will look for it; but owing to its color, which is nearly that of the bark of the pine, and to its habit of perching on high branches close to the trunk, it is not easily seen except by an expert. On the very last day of our camp we found a haunt of these birds, a bare sandy place among bushes, where their foot-prints were as thick as the tracks in a poultry-yard. The wild-cats had found it too, for their trails were distinct in

There were fires in the valleys and cañons below us all summer, and the mountain itself in former years had been so often in flames that there was hardly a tree on it unscorched. The authors of this annual crime, which must seriously affect the scanty water-supply of arid southern California, are herders who drive thousands of sheep over the government wild lands, and, when they have stripped a region, put the torch to the brush, to improve the pasturage for the next season. From the brush the fire spreads to the woods. There is nothing to stop it, and nobody but the disgusted tourist cares. There had been a fire burning at the north foot of the mountain for some days, which we watched with uneasiness, for the prevailing winds were from that quarter. The pine forest on that side covered the whole slope. As soon as the

flames got among the trees, destruction seemed to be sweeping upon us. It was a terrible but fascinating spectacle, standing on the edge of the ridge, and sheltering ourselves as well as we could behind masses of rock from the heat

ous to know what comforts and what necessary outfit we carried on horseback through woods and thickets and ravines to this solitary mountain height, and how much the expedition cost. When we formed The Pine Mountain

A SHAVING AND HAIR-DRESSING SALOON.

and the dense resinous smoke, to look down by night into the burning wood, and watch the fall of blazing pines and the steady advance of the conflagration, a line of fire two or three miles long roaring and crashing straight toward our camp. It was impossible to check it on the slope. We watched for two days. Then the flames reached the top, hardly a quarter of a mile behind our tents. The timber there, however, was open enough to give us a chance to fight the flames by digging a trench and kindling a contrary fire; the wind providentially shifted a little, and after a laborious and anxious night the danger passed on one side. We had brought in our horses and made every preparation for flight. Our lives were in no great peril, for the trail remained free, but we came near losing all our goods, and we narrowly escaped being cut off from our only spring of water. The mountain burned all the rest of the summer, and a fresh fire was started by the shepherds on the south side the day we left.

And now perhaps my readers will be curi-

Camping Company, we agreed that each member should please himself as to his personal outfit,—tent, bedding, horse, etc.,—and that everything for common use should be paid for by the treasurer out of a common fund. Three of the party had their own horses; two horses were hired at \$12.50 a month each; and the use of two more was included in our contract with Soper. There was the greatest variety in the views of the company as to personal baggage. One or two were satisfied with a pair of blankets, a quilted comforter costing about \$3, and a canvas bag for a few clothes and toilet articles. The price of such an outfit probably did not exceed \$12. At the other extreme was the establishment of the lady and her husband. They carried a tent which cost \$15 and was sold at the end of the season for \$10; three pairs of blankets, worth \$8 a pair; two mattresses, costing \$8.75 each; two small pillows; two camp-chairs; a tin basin; a paperpail; and canvasbags containing a change of clothing. The blankets, mattresses, and some other articles were sold afterwards at half price.

FAREWELL TO PINE MOUNTAIN.

The total first cost of this equipment, including a few miscellaneous things which I have not enumerated, was \$72, and the amount realized from the sale of portions of it was \$32, leaving a net cost of \$40 for two persons. This, of course, did not include clothing: for the most part we wore what old things we had, using flannel altogether for under-garments, and carrying only one change, as washing could always be done in camp.

The general outfit comprised kitchen and

table utensils, tools, etc. The principal articles were the following:

	<i>Cost.</i>		<i>Cost.</i>
Stove	\$3.00	Twelve spoons.....	\$.55
Roaster	2.00	Nine agate plates...	2.25
Dutch-oven (borrowed)		Six agate cups	1.80
Kettle.....	1.50	Agate pitcher	1.00
Three saucepans....	1.35	Towel and napkins..	3.70
Broiler50	Water-vessels	2.50
Frying-pan.....	.50	Tools, nails, rope, etc.	8.16
Pans and pails	2.75	Miscellaneous.....	13.34
Other kitchen utensils	4.60		
Six knives and forks.	2.63		
			<hr/>
			\$52.13

From the sale of this property we obtained \$20, leaving a net cost of \$32.13, to be divided among five people.

Our current supplies included, as the reader will have inferred from the preceding pages, nearly all the ordinary family groceries and a great many table luxuries also. Besides substantial provisions, such as flour, meal, sugar, coffee, tea, ham, bacon, etc., we had plentiful supplies of olives, jellies, sauces, raisins, sago, tapioca, corn-starch, cheese, dried fruits, excellent fresh butter, honey, fresh eggs, fresh fruit, and vegetables. Our meat bill covered little except sheep, of which we ate five in the course of the season. For the hire of the cow we paid \$10 a month. At first she found ample pasturage, but after we went up the mountain we gave her about a dollar's worth of barley a week. We calculated the cost of the milk at six cents a quart, which was cheap, considering the comfort we got from it. The horses fared well, foraging for themselves, until a week or two before we broke camp;

then we got a little barley for them, not more than three or four dollars' worth altogether.

We paid the cook \$1 a day. We paid the guide \$3 a day for his own services and the use of his two horses. Reckoning supplies, wages, and the rent of the cow, the living expenses of the whole party of seven, with the eight animals, amounted for sixty-eight days to \$562.31, which, divided among five, gives a cost of \$112.46 a head. Taking for the cost of the personal outfit the highest of the figures I gave above, we have the following as the expense to each person of a camping expedition of sixty-eight days:

Personal outfit.....	\$20.00
Share of general outfit.....	6.43
Current expenses	112.46
Total.....	\$138.89

Or \$2 a day. As we lived like *gourmets*, and made no great effort to economize, this, we thought, was doing pretty well.

John R. G. Hassard.

IN A DARK HOUR.

THOSE tender mothers! When such little things,
 Such helpless, fragile little things we are,—
 How they pray God for us! how they make war
 For us with death! and spread their mother-wings
 About us full of anxious quiverings,
 And spying each least peril from afar,
 With their own arms, thereto made mighty, bar
 The way from harms and smile at adder-stings,
 And brave the tigers merciless and wild,
 In their deep love for us; and by and by,
 When we are men, to strive and stand alone,
 We clasp our desperate, aching heads and moan:
 Would God my mother had left me to die!
 Would I had died a sinless little child!

Gertrude Hall.

COMPOSITE PHOTOGRAPHY.

WE are all interested in typical representations. The novelist or poet holds and gratifies us as we feel that the character which is portrayed with skillful words is the type of a class. The artist draws an ideal head, his expression of a type for which no single model will serve, and we look with satisfaction and pleasure at the product of his fancy. Both artist and author seek to sketch a face or character that has grown in their minds by the blending

of impressions gained from the observation of many individuals. The result at which they aim is a generic portrait which shall retain the typical characteristics of the class for which it stands, while the peculiarities and idiosyncrasies of the individuals are left out.

The generalized image, which the creative mind is able to seize upon and express, rises with more or less vividness in the mind of every one as the representative of the class or group of objects which is present in his thought. This image is often a vague and unsatisfactory one, and the mind, in its efforts to gain clearness, runs rapidly over the more distinct im-

ages of members of the class, and not infrequently ends in selecting some one of these to stand as the type of all. This is more apt to be the case when the group is a familiar one. When unfamiliar, the individual characteristics are for the most part unnoted on first observation, and the only distinct mental image formed as one thinks of the group is the blended one.

The individuals of a strange race at first look all alike to us; the members of a family which we see for the first time often have for us an unmistakable family resemblance, which is quite unperceived by themselves and those familiar with them. The unconscious analytical process which proceeds with longer observation soon leads us readily to distinguish the individuals of the race from each other, and to lose the vividness of impression which the family resemblance had made; so that now the generic image is called up with difficulty or not at all. In the observation of objects, it is the exceptional which most strongly impresses us, and this aids in making the mental generalization untrustworthy.

It is evident, also, in the representations of the artist, however admirable as products of artistic imagination and skill, that the personal equation cannot be wholly eliminated. Recall, in illustration of this, the dissimilarity which marks the portraits of the same person by different artists. Each painter strives to put upon his canvas the face he sees; it is the

THIRTEEN OF THE CLASS OF '83 OF SMITH COLLEGE.
(FROM NEGATIVES MADE IN JUNE, 1886.)

same face, and yet each sees it through the glass of his own individuality, and paints it with the characteristics with which this medium has tinged it. When, instead of the likeness of an individual, the aim is to produce the type of a race or family, the model for which exists only in the blended mental images of the artist, one readily sees that the difficulties in the way of truthful representation are greatly enhanced.

The typical portraits which are necessary for the study of race or family characteristics are such as will give, in form and feature, the average of the group. But the usual statistical method for obtaining averages from direct measurements cannot be here employed, for the differences in human features are too numerous and too minute. If, on the other hand, we endeavor to select a representative face from the group and reproduce it by photography, we are likely to fail as completely as the artist, and for much the same reason — our judgment in such a selection is not to be trusted.

To escape the difficulties which beset attempts to get truthful representations of a typical face, Mr. Francis Galton made the clever suggestion of blending the portraits of the individuals of a group by means of photography.

In his presidential address to the Anthropological Subsection of the British Association, in 1877, he said:

COMPOSITE OF SEVEN MEMBERS OF THE CLASS OF '84 OF SMITH COLLEGE. (FROM NEGATIVES TAKEN IN JUNE, 1886.)

FORTY-NINE MEMBERS OF THE CLASS OF '86 OF SMITH COLLEGE.* (FROM NEGATIVES MADE IN DECEMBER, 1885.)

"Having obtained drawings or photographs of several persons alike in most respects, but differing in minor details, what sure method is there of extracting the typical characteristic from them? I may mention a plan which had occurred both to Mr. Herbert Spencer and myself, the principle of which is to superimpose optically the various drawings, and to accept the aggregate result. Mr. Spencer suggested to me in conversation that the drawings reduced to the same scale might be traced on separate pieces of transparent paper and secured one upon another, and then held between the eye and the light. I have attempted this with some success. My own idea was to throw faint images of the several portraits, in succession, upon the same sensitized photographic plate."

Suppose a number of stereopticons arranged side by side so that a portrait may be projected from each upon the same part of the screen. A curious blending will take place as portrait is added to portrait on the screen and adjusted to its place, which recalls the transition period of dissolving views, but which, if the several portraits have the same aspect and are nicely adjusted to exact superposition, finally yields a face from which the individuals have disappeared, and which retains in its stronger lines only those traits which are common to all or many of the number.

If a photographic plate could take the place

of the screen, the composite picture could be made permanent. One can readily imagine a multiple photographic camera by which this might be accomplished, but as it would need as many lenses as there were portraits, it would be both expensive and awkward in manipulation, besides giving distorted images from the tubes at greatest angle with the central one.

The same result can be more easily and perfectly obtained by means of a single camera in which the portraits are photographed in succession, instead of all at once.

One might not unnaturally suppose that a process of this kind would give nothing but an indistinct blur, with faint, if any, resemblance to the human face; but the illustrations of this paper, which were all reproduced from photographs made in the way I have just indicated, show that this is far from being the case. They are somewhat shadowy in outline, to be sure, but distinctly human and attractive.

The results of this method of "pictorial statistics" will be better understood and appreciated if I give a little account of the way in which composite photographs are made, and discuss briefly some of the critical difficulties of the process.

* A reproduction of this portrait appeared in "Science" for July 30, 1886.

Mr. Galton's first results, which he submitted to the Anthropological Institute, in 1878, under the title of "Composite portraits made by combining those of many different persons into a single resultant figure," were obtained by exposing to the same sensitized plate a number of photographs in which the figures were similar in attitude and size. These photographs were hung on pins, one in front of the other,—“in such a way that the eyes of all the portraits shall be as nearly as possible superimposed.” A photographic camera was then directed upon them, and by a successive removal of the photographs from the pins, the images of all were thrown upon the same part of the sensitized plate. The object-glass of the camera was of course capped during the removals, and the interval of each exposure was the same and such that the total exposure was equal to that which under the circumstances would be necessary to give an exact photographic copy of any one of the portraits. In 1881 Mr. Galton recurs to the subject in a paper read before the Photographic Society, in which he describes at length a special apparatus for making composites and advises working directly from negatives by transmitted light.

Both of these papers—the former one in part only—are contained in an appendix to "Inquiries into Human Faculty," by the same author.

Even the simpler form of the special apparatus which Mr. Galton describes is so complex that many who might otherwise be inclined to experiment in this fascinating branch of photography are likely to hesitate and turn away. I have however found that a much less elaborate and costly apparatus is capable of giving perfectly satisfactory results. I will describe it, in the hope that some of the many amateur photographers may be induced to add composite portraiture to their accomplishments. The camera has a longer box than the ordinary form, with an opening in the top over which a piece of ground glass is fixed, and a mirror hung within at the back upper corners. This mirror—a piece of looking-glass in a

CO-COMPOSITE MADE BY COMBINING THE THREE COMPOSITES OF NUMBERS OF THE CLASSES OF '83, '84, AND '86,—A GROUP OF SIXTY-NINE.

wooden frame—is provided with a handle which projects from the side of the box and by means of which the operator can swing it into either of its two positions,—up against the top of the camera, where it is held by a spring-catch, or down to an angle of forty-five degrees, where it rests on a stop. When the mirror is in the former position, the camera is to all intents an ordinary one, and the image of the photographic object falls upon the ground glass or sensitized plate at the back; but when the mirror rests on its stop, the image is formed on the ground glass which covers the opening in the top. Both ground-glass plates must be at the same optical distance from the lens, so that an image focused on either shall be sharply defined on the sensitized plate when this is put in position. This arrangement enables one to adjust any number of successive images by means of reference lines drawn on the ground glass on top, without disturbing the sensitized plate. A very satisfactory camera of this description can be made of soft wood by any skillful carpenter at little expense.

The lens should be one of short focal distance—five or six inches—so that in making composites of about the same size as the individual portraits the apparatus need not be inconveniently lengthened. For, if the image is to be equal in size to the object, both must be distant from the lens twice the focal distance of the latter.

In front of the camera, and clamped to the edge of the table upon which it is placed, is a holder for the support of the negatives. This may be an ordinary slide-holder of a magic lan-

ARRANGEMENT OF APPARATUS FOR MAKING COMPOSITE PHOTOGRAPHS, WITH SECTION OF THE CAMERA.

TWENTY-SEVEN MEMBERS OF THE NATIONAL ACADEMY OF SCIENCES.*
(FROM PHOTOGRAPHS LENT TO THE AUTHOR BY PROFESSOR BREWER.)

tern or stereopticon, with spring clips which retain the plates securely while they allow all necessary shifting for the purpose of adjustment. The holder is backed by a piece of ground glass which serves to diffuse the light of the lamp or gas-jet used as a source of illumination. The employment of artificial light in making composites insures equality of illumination during the entire time of working, and also renders the photographic action slow. This is desirable, because the fractional exposures being longer can be more accurately timed.

The apparatus, as shown in the drawing, is arranged for making composites from negatives, for this is the best and surest way of obtaining good results.

The negatives for the purpose are taken by means of an ordinary camera and in the usual way. The sitters are placed in the same position, commonly full face or profile, and photographed under the same conditions of light and shade, and of the same size. The development of the plates should be so managed that the negatives shall be very "dense" and of uniform quality in this respect.

In making the composite three conditions must be carefully controlled if the resulting portrait is to be a faithful representation of the type of the group. In the first place, the images

which fall upon the sensitized plates must all be brought upon the same spot, and in such a way that the prominent features are accurately superposed. Carelessness in this matter of adjustment gives a composite which is all awry,—with several mouths, noses, and pairs of eyes. An inspection of the negatives from which a composite is to be made usually shows a considerable variation in the proportion of the faces, so that if, in the adjustment, the eyes are all brought on the same points, the mouths will fall on different lines, and the composite will be disfigured with a multiple mouth. If the mouths are alone considered the case is no better, and the composite will be unnatural and worthless. But if the components are adjusted in such a way that the distance from the line of the eyes to the mouth is the same in each instance, there is merely a distribution of the eyes over a short horizontal distance. This results in no disfiguring blur, but, on the contrary, gives, as it seems to me, a more truthful portrait of the type than if the eyes are accurately superposed; for, in the latter case, a deep-eyed earnestness of expression is obtained, which is in no way the average, but rather a summation, and, therefore, an exaggeration of this trait.

Hence, in order to get what may be called

* Other composites of members of the National Academy, made under the direction of Professor Pumpelly, appeared in "Science" for May 8, 1885.

a normal composite, the component images should be all adjusted so that the line passing through the corners of the eyes shall be at a constant distance from the mouth. For the purpose of adjustment, then, three lines are drawn with a fine-pointed pencil on the ground-glass focusing plate on top of the camera: two parallel lines for eyes and mouth, at a distance determined by the desired size of the portrait, and a third at right angles to them, to mark the line of the nose. To these lines the features of each component are brought as exactly as may be, by shifting the negative in its holder and enlarging or reducing the size of the image where necessary.

In the second place, the sum of the times of exposure must be equal to that necessary to make a good single photograph, and each of the exposures must be equal in length; so that, for instance, if a composite is to be made of sixty components, and sixty seconds would be required under the conditions to copy a single negative, each exposure must be for one second. If the condition of accurate timing of the successive exposures is not fulfilled, the composite will not be a true average, but the features of the longer-exposed components will predominate. When the number of components is so small that each fractional exposure is several seconds, reasonable accuracy can be attained by uncapping and capping the object-glass by hand; but in making a composite of a large group, where the exposure must be very brief, some automatic device should be employed. That which the writer has used consists of a pendulum whose rod extends above the point of suspension and has fixed to it at right angles an arm some eighteen inches in length, carrying at its extremity a little screen of cardboard or ferrotype plate. The pendulum rod is provided with sliding weights above and below the point of suspension, and by changing the position of these the time of vibration can be varied through a wide range. The proper time for each exposure is determined, and the sliding weights adjusted so that this shall be the time of the pendulum's vibration. Then, by the aid of a counterpoise opposite the arm, the little screen is brought to such position that when at rest its lower edge lies across the horizontal diameter of the camera tube. When an exposure is to be made, the screen is held down so as completely to cut off the light from the lens while the slide in front of the sensitized plate is drawn, then released, allowed to play once up and down, and stopped when it reaches its former position. With a small stop in the camera tube the exposure thus made is that of a single vibration of the pendulum.

Thirdly, the illumination of the images which fall on the photographic plate must be

in all cases equal; for the chemical action of light is more or less rapid according to its intensity, and hence a more strongly illuminated component would tend to predominate in the resulting portrait, just as one would which was exposed for more than its proper time. Indeed, as is readily seen, the conditions of time and illumination are mutually dependent, and might

FAMILY OF EIGHT—FATHER, MOTHER, FIVE BOYS, AND GIRL.

be stated together by saying that the product of time of exposure by intensity of illumination must be the same for each component. If the negatives have been carefully developed to a uniform density, no change in illumination will be necessary; otherwise a slight variation will have to be made.

Does the order in which the components are exposed affect the result? This is a question which occurs to many who examine these composite photographs, and there seems to be a widespread notion of mysterious origin that the negative last exposed must have the greatest effect on the sensitized plate. If the order makes a difference, then the process will not give the truthful average, unless the times of exposure or the intensities of illumination are correspondingly varied. The question can be conclusively answered in the negative. Composites made from the same components taken in different orders are sensibly identical. This is the case even when the number of components is only two or three, where individual predominance, if it occurred, would be strongly

marked. There is a difficulty, however, in determining identity or dissimilarity in faces with manifold detail which makes this method of attacking the question somewhat unsatisfactory. This difficulty disappears for the most part when in lieu of faces patches of different colors are employed. Each color acts with different energy on the photographic plate, and hence, if composites of, say, three colors are made, the colors being taken each time in a different order, the results would be patches of different depths of shade, if the order of exposure affects the result; but of the same tint if the order is without influence. Experiments of this kind repeated in several different ways agree in their testimony that the order makes no difference.

The portraits, obtained by the process I have sketched, present the prevalent type of the group from which they are made with an accuracy which is undisturbed by the subjective element which is so unavoidable a factor in the results secured in any other way.

Suggestions have indeed been made of the possible prepotency of some powerfully individual or characteristic face in controlling the result, and instances have been pointed out in which this appeared to be the case—the strong resemblance to some member of the group lending color to the notion that this individual dominated all the rest and in some mysterious manner stamped the composite with his personal likeness. Unfortunately for the value of this suggestion, however, strong resemblances have as often been remarked, when the person for whose likeness the composite might well serve has not been a member of the group at all. The simple and sufficient explanation in either case is that the individual in question happens to be a close approximation to the average of the group. The very way in which the composites are made—by successive equal actions of light images on the sensitized plate—shows that in a carefully made composite there can be no question of individual prepotency. The contribution of each component of a large group is so small that the strong lines of the composite must be those in which similar lines in a majority of the components have reinforced each other, while the individual traits have almost disappeared. In a composite of a small group one can often trace the individual outlines and features, while in bolder lines the new and average face appears.

While composite portraits give pictorial averages, “they are,” as Mr. Galton justly says, “much more than averages; they are rather the equivalents of those large statistical tables whose totals, divided by the number of cases and entered in the bottom line, are the averages. They are real generalizations, be-

COMPOSITE OF “MONDAY EVENING CLUB,” NORTHAMPTON, MASS., OF TEN GENTLEMEN—2 CLERGYMEN, 2 PHYSICIANS, 2 LAWYERS, 3 COLLEGE PROFESSORS, AND 1 MANUFACTURER; AVERAGE AGE, 35 YEARS.

cause they include the whole of the material under consideration. The blur of their outlines, which is never great in truly generic composites, except in unimportant details, measures the tendency of individuals to deviate from the central type.” Thus the shadowiness of outline, which causes some to exclaim at the composite as ghostly and uncanny, is an element of value in the result by showing the distribution of the component faces about the mean.

The most obvious application of composite photography is in the field of ethnological research, to secure types for the purpose of the comparative study of race characteristics, and which may serve as a record by means of which possible changes in type from generation to generation and from age to age can be traced. This interesting study may well be extended to sub-races and families. Mr. Galton says, “I think it [composite photography] can be turned to most interesting account in the production of family likenesses . . . the result is sure to be artistic in expression and flatteringly handsome, and would be very interesting to the members of the family. Young and old, and persons of both sexes, can be combined into one ideal face. I can well imagine a fashion setting in to have these pictures.”

Composite photography gives, further, a

means for obtaining typical representations of groups illustrating health and disease, or the influence of occupation or profession.

Composites of small groups give portraits which, from the nature of the case, are of less typical value than those made from a large number of individuals. They have, however, an interest of their own which the others do not possess. A young lady, on seeing for the first time a composite of a small group of which she was a member, wrote me: "It is charming to enjoy the society of somebody who is all one's intimate friends at once."

Several persons, on examining a composite made from a few negatives, have assured me that they saw in turn most or all of the members of the group — one face fading away as a new one emerged. But this was after they had been told who the individuals of the group were. Where the imagination is strong enough to produce this effect, its possessor must find a peculiar interest in the composite of a group of friends.

Another application of the process, which has been suggested, is for the purpose of securing a more satisfactory likeness of an individual by combining several likenesses taken at different times. In this way the passing and often constrained or conscious expression, which frequently renders ordinary photographic portraits unsatisfactory, would be eliminated, and a somewhat idealized likeness be obtained. So far as I know, just this application has yet to be made; but a similar use of the method with a view to getting a more truthful portrait of an historical personage, by making a composite of such likenesses as may be in existence, has been employed in the case of Alexander the Great (Mr. Galton's first composite, from six medallions from the collection of the British Museum), and of other heads from coins and medals, of Washington,* and of Shakspeare. The great difficulty here lies in the small number of portraits in existence in which the individual is represented in approximately the same position.

It is quite possible that composite photography may be successfully applied in other ways than those already noted. Types of animal species, standards of different breeds, might be obtained, if the difficulties of securing pictures of a number of animals in the same position could be overcome.

A curious employment of the process was not long ago suggested by Dr. Persifor Frazer, of Philadelphia, by which the genuineness of a doubtful signature is tested by comparing it with a composite made from a number of signatures which are known to be genuine. Practical application of this method has already been made in court, and from the experience thus gained Dr. Frazer is of the opinion that it will, in many cases at least, prove a more trustworthy means of arriving at the truth than the testimony of even the most skillful expert.†

In the idealized features of composite portraits artists will undoubtedly find valuable suggestions, and they are, Mr. Galton believes, capable of forming the basis of a very high order of artistic work.

There are a number of ways in which a composite effect can be produced without the aid of photography. Thus, the images from magic lanterns or stereopticons may be blended on a screen, as has been already mentioned; Mr. Herbert Spencer's suggestion of superposing transparencies may be carried out with drawings on tracing-paper or photographic transparencies, carefully made, of the same aspect and size. A better method for combining two portraits is by means of a stereoscope. The two photographs or engravings must of course be selected with reference to the position of the head, though they need not be of exactly the same size. Holding one in each hand as one looks through the glasses of the instrument, one readily finds the positions in which they must be placed for the images to blend. But unless the observer's eyes are equally good, and he has the habit of using both equally, there will be in this experiment a plain case of "prepotency"; and even with good eyes there will be often noticed a curious struggle for mastery between the components.

Still another way of bringing the images of two portraits together is by means of a doubly refracting prism of Iceland spar.

All these methods are at the best imperfect, and although interesting and well worth trying, cannot for a moment compare with a process by which an indefinite number of components can be accurately combined, and which gives an objective and permanent result.

John T. Stoddard.

*A plate in "Science" for December 11, 1885, shows three composite portraits of Washington made by Mr. W. C. Taylor.

†Two papers on this subject, illustrated by a com-

posite of Washington's signatures and the components from which it was made, appeared in the "Proceedings of the American Philosophical Society" for July, 1886. The plate was reproduced in "Science" for Oct. 15, 1886.

RECOLLECTIONS OF SECRETARY STANTON.

BY A CLERK OF THE WAR DEPARTMENT.

MY acquaintance with Secretary Stanton began in the autumn of 1864. He was then in his fiftieth year, but looked older by reason of the abundant tinging of his originally brown hair and beard with iron-gray. He was a short, stout man in figure, awkward in gait, and with a certain unsteadiness in the movement of his arms which, I think, was due to incipient paralysis. His forehead was full without being especially high; his eyes were a soft, dark brown, but were habitually hidden behind glasses; his nostrils were broad and tremulous, and his mouth prominent and firmly set; his dress, while not negligent, was unstudied and ineffective.

Whether speaking or listening, Mr. Stanton looked his visitor full and steadily in the face. He spoke in low, deep, and cold tones, and, even in anger or excitement, scarcely increased or hastened his speech. The effectiveness and flexibility of his voice induces me to believe that in earlier life he had studied and practiced elocution as a preparation for the bar. His movements, too, were always slow and dignified, and in speaking he constantly changed his position and attitude. However these habits were acquired, they had become second nature with him, as he observed them even when momentarily unbalanced by passion.

The glittering of the eyes through the polished glasses; the breadth and quivering of the nostrils; the projecting, compressed lips; the icy, deliberate voice; the slow movement of the body, and the steady, seemingly defiant gaze, gave to the Secretary an air of reserve and haughtiness which made the first approach to him embarrassing. Nothing was more common or more amusing than to see some pompous or arrogant personage ushered into his presence, only to emerge from the room in a state of collapse, crushed by the manner rather than by the words of the lion at bay within.

Many stories have been told concerning Mr. Stanton's alleged sullen and contemptuous reception of communications from his superior officer, the President. All such tales are either grossly exaggerated or wholly false. Mr. Stanton had a profound respect for au-

thority, which rarely, if ever, failed of outward observance. Furthermore, his legal or political studies had led him to attach a great degree of importance and a considerable share of reverence to the office of President, apart from its incumbent; and this ideal and exalted figure seemed ever present to his imagination, and made frequent appearances in his writings and speeches, though it was hard to identify it with the gaunt, ramshackle presence of Mr. Lincoln, as that presence appeared when its owner was, as an artist would say, in repose. The President, too, was not a man to endure disrespectful treatment from anybody in legal subordination to him, and was careful of his official dignity even in small matters, as the following incident will show:

When Mr. Stanley, of North Carolina, was appointed Military Governor of his State, the Secretary of War caused to be filled out one of the blank forms used for notifying military nominees of their appointment to office by the President, and when he had signed it and caused the seal of the Department of War to be attached to it, he concluded that it would be well to have the sign-manual of the President affixed to the instrument. He sent the commission to the White House, with the request that the President would sign and return it immediately. Mr. Lincoln took the document and read it over carefully, and then began turning and twisting it about, as though in search of something. At last he handed it to the bearer and said, ironically:

"Did Mr. Stanton say *where* I was to put my signature?"

"No, sir," replied the astonished clerk.

"Can *you* tell me," asked the President, "whereabouts on this paper I am to put my signature?" The clerk looked at the commission and saw the ample signature of Mr. Stanton immediately at the foot of the body of the instrument, with the counter-signature of the Adjutant-General to the left. He saw also a neat, snug-looking white space beneath the sign-manual of the Secretary of War which Mr. Lincoln might have occupied to advantage had he seen fit, but the clerk was politic and replied: "I don't see any place provided for your signature, Mr. President," and was proceeding to explain how the omission obviously came about when the President inter-

rupted him and said, in a dignified tone: "Take the paper back to the Secretary of War, with my compliments, and say that the President will promptly sign any *proper* commission that may be sent to him for Governor Stanley, or anybody else."

The grain of truth in the stories of Mr. Stanton's rude reception of the President's missives is probably this—that the bearers of such as related to their own concerns frequently came to the War Department in a state of hysterical elation and hauteur, demanding immediate admission to the Secretary, and, when admitted, waiting with insolent impatience for a submissive word of acquiescence, and losing control of themselves in the course of a colloquy like the following:

"This matter shall receive proper attention, sir."

"When, Mr. Secretary?"

"I cannot say, now; but you shall be duly advised whenever necessary."

"But I understood from the President that it was to receive immediate attention."

"I have received no such understanding, sir."

"But are not the orders of the President to be obeyed in this department, sir, the same as in other departments of the Government?"

"I decline to discuss the relations of the President and this department with you, sir; you may retire."

"Very well, Mr. Secretary. I shall go right back to the President and tell him how his positive commands are disregarded here."

"*You may go to the devil, sir! Leave the room!*"

More hysterics on the part of the visitor and more fireworks by the Secretary, ending in that animated mummy, "Old Madison," taking the victim by the arm, leading him into the hallway, standing him up against the wall, and giving him a "real good talking to," ending with the entirely unnecessary assurance that "Mr. Stanton is a hard man to trifle with." If the panting stranger showed signs of docility, Madison would extract from him the nature of his business and give him "points" as to the safe and proper mode of following it up; but if he remained sullen or combative, Madison would make some mysterious allusions to the Old Capitol Prison and dismiss him to the White House, or elsewhere.

All the time that I knew him, Mr. Stanton was a passionate man. A word or a gesture would set him aflame in an instant. He would dash the glasses before his eyes far up on his forehead, as though they pained or obstructed his vision; the muscles of his face would become agitated, and his voice would tremble

and grow intense, without elevation. But the storm would pass away as quickly as it came, and be succeeded by a calmness of demeanor almost as painful by reason of the sudden contrast. If the victim was a subordinate, further reparation followed. At the next succeeding interview, the white, soft hand of the Secretary would be laid in a kindly and seemingly unconscious way upon his shoulder, or the flattering discovery would be made that he was looking ill or worn from overwork and must take a little recreation, or a conventional or seasonable cough would be magnified into an alarming symptom, and directions given for the unconscious invalid to go to the Surgeon-General and be prescribed for by the Secretary's order. If the offended subordinate was of considerable rank, an important piece of news would sometimes be told to him in confidence, or his opinion would be asked on some subject wherein he regarded himself as an expert. General Halleck or General Canby would be placated by the submission to his judgment of some question of public law, or Madison, the aged and garrulous negro who was usually to be found anywhere but at his post at the Secretary's door, might delay a cabinet meeting or a dinner party while retailing to the Secretary the latest piece of gossip which his wife had picked up in her vocation as a nurse, or expounding his confused ideas of what the Government should further do for the "cullud" people. Every undeserved visitation of wrath was sure to be followed by an act of expiation, and the keen perception of the Secretary (who would take notice of so small a matter as the placing of a clean blotting-sheet on his desk), and his unfailing memory (I have often heard him recall apparently trivial things weeks after their occurrence), enabled him with certainty to choose both the time and manner of healing any wound he might have inflicted.

Adjutant-General Townsend, by reason of his position and duties, had to bear in greater measure than any other official the infirmities of Mr. Stanton's uncertain temper. He told me, after the latter's death, how touched he was by finding himself named, in kindly phrase, as one of the executors of his will.

The Secretary's irritability was doubtless due in some part to the state of his health, which had become undermined during his service at the head of the War Department. He suffered greatly, and almost unceasingly, from the asthma, which at last ended his life, and his suffering was aggravated by a serious disorder of the liver. The Surgeon-General attended him daily, and during the fall and winter of 1864 his condition was such as to cause great anxiety. Twice in that period he fell at his post from violent fits of strangula-

tion, as I suppose them to have been. But he would not hear of taking a furlough for any period, however short. At the solicitation of the Surgeon-General he would make attempts at exercise by walking, to which he had grown averse; he followed his medical director in matters of diet; he smoked cigars to relieve his asthma and ceased to smoke them when the affection of the liver required; but he would not abandon his inspection of or action upon the multitude of official papers that came before him, nor deny himself to the public or to the officers of his department, nor keep to regular hours of business. He would meet the Surgeon-General's remonstrances and suggestions with the remark, spoken good-naturedly, "Barnes, keep me alive till this rebellion is over, and then I will take a rest!" adding, more seriously, "a long one, perhaps." To Senator Wilson, who expressed to him the fear that they were both wearing out (Wilson, as chairman of the Military Committee, had an unceasing and laborious task), he said, "We are enlisted for the war, and must stand to our guns till the last shot is fired." After the cessation of hostilities his health improved for a time, but he was too far gone for any permanent amendment, and was never himself deceived as to his condition or prospects.

The genuine character of the Secretary's outbursts of anger had much to do with reconciling his associates to them. His rage took note neither of time, place, nor personage, so that all fared alike in chastisement as in atonement. Of course he did not esteem everybody about him in equal measure, but those whom he disliked were very few, and his aversion to them was sincere, even where possibly unjust.

The War Department in those days was a dingy, old-fashioned brick building, with dimensions and interior finish reflecting the severe and economical tastes of Federal officials half a century or more ago. A tawdrily frescoed room and a stick or two of velvet plush furniture kept alive the memory of Mr. Secretary Floyd, whose habits, according to the stories of the older attachés, were sybaritic. Early in the war, a third story had been hastily clapped on to the original structure, and the flues of this addition were so defectively constructed that incessant care was necessary to prevent the department from being burned out. Beside the original and expanded building, the War Department occupied outside buildings enough to constitute a good-sized town in number and extent. The parent building was a hive of industry day and night, those having personal relations with the Secretary always returning after dinner, and double reliefs being worked in some of the routine offices. All day long, from nine to four, a

steady stream of people poured into, out of, and through the building, and the door-keeper's daily watch-book showed a long list of names of persons privileged to enter without regard to hours.

The Secretary's room was in a corner of the second story, with an outlook toward the Executive Mansion. It was very plainly fitted up and furnished, the most conspicuous article in it being a large, high table (usually heaped with papers) which Surgeon-General Barnes had recommended as a means of affording the invalid needed exercise while attending to business.

Adjoining and communicating with the Secretary's apartment was one much used by President Lincoln, and furnished with a desk and writing materials for his accommodation. After his death some freshly written sheets were found in his drawer, which read like parts of an intended message to Congress, and dealt with the status in which slavery and the insurgent governments had been left by the collapse of the rebellion. It would seem from these that it had been his purpose, as contended on one side, and denied on the other, during the quarrel between President Johnson and his party, to call Congress together in special session to deal with the question of reconstruction.

In the days of which I write, Mr. Lincoln was a particularly woe-begone figure. It was one of those periods of the war when the whole situation, military, financial, and political, was one of almost unrelieved blackness. He spent hours at a time shut up with Mr. Stanton, all business and speech mainly being put aside, so far as outsiders could judge, while these lonely communions lasted. Was it not the gloomy autumn days of 1864 that the tearful Secretary had in mind when he spoke those pathetic words as he took the hand of the just-expired President: "Ah, dear friend! there is none now to do me justice; none to tell the world of the anxious hours we have spent together!" Even before the autumn had well set in, Mr. Lincoln had begun to enwrap himself in the familiar plaid shawl, and, with his hat pulled well down in front, he would scurry along the halls of the War Department and into the retiring-room of the Secretary, noticing and speaking to nobody. At times he would sit in the retiring-room with the door open between that and the apartment in which the Secretary, walking about as was his wont, was transacting business with the departmental officers and clerks, or visitors, prolonging his course, every few minutes, into the adjacent room, to hold converse with his chief. It was an interesting and a pleasant sight, that of Mr. Lin-

coln seated with one long leg crossed upon the other, his head a little peaked and his face lit up by the animation of talking or listening, while Mr. Stanton would stand sidewise to him, with one hand resting lightly on the high back of the chair in the brief intervals of that everlasting occupation of wiping his spectacles. But if, while in such proximity, Mr. Lincoln should happen to rise to his feet, farewell to the picturesqueness of the scene, for the striking differences in height and girth at once suggested the two *gendarmes* in the French comic opera.

Beyond the President's room was the library, converted into a telegraph office, wherein the President used occasionally to unbend himself when the Secretary was beyond earshot and the news from the front was encouraging. Mr. Stanton was a great user of the telegraph, and a fair history of the war might almost be written from the manuscript volumes of telegrams received and sent by him, preserved in the Department. A general officer holding an important command in the Gulf region told me, after the war, that Mr. Stanton's telegrams were so frequent, peremptory, and regardless of hours that he never lay down in his tent or quarters at night without a mental picture of the Secretary of War watching his every movement.

Business at the Department opened at nine in the morning, and the uncertainty as to how soon the Secretary might arrive induced great promptness in attendance. As his carriage turned from Pennsylvania Avenue into Seventeenth street, the door-keeper on watch would put his head inside and cry, in a low, warning tone, "The Secretary!" The word was passed along and around till the whole building was traversed by it, and for a minute or two there was a shuffling of feet and a noise of opening and shutting of doors, as the stragglers and loungers everywhere fled to their stations.

As the carriage drove up to the curb, persons would detach themselves from the straggling group on the sidewalk and gather around the step to intercept the Secretary on his way to the building. Rapidly glancing over the party, he would select those whom he judged to be objects of compassion or urgency and hear and decide for them on the spot. The rest he dismissed, singly or in mass, with a curt injunction to go to his reception-room, upstairs. The favored few were usually soldiers from the hospitals, or wives or mothers of soldiers in attendance upon wounded relatives. "My good woman" was his usual form of address to these latter, but he invariably called an elderly woman, however humble her apparent station, "Mad-

am." In fact, he had the traditional Chinese reverence for the aged of either sex.

As soon as the Secretary had reached his room, he began tugging at the tasseled cord that hung from the ceiling and set in motion a bell hanging in the hallway, so large and clamorous that it was a mystery to me how or why it was put there. Its deviser, however, "builded better than he knew," for the bell became a moral influence. Its tones reached all over the building, and as the active Secretary gave it little rest in the summoning of messengers to be sent hither and thither, it was forever filling the ears and minds of the working staff with lessons of duty and necessity.

Although Mr. Stanton was by nature an accessible man, it was simply impossible for him to give private audience to a tithe of the persons who daily inquired for him. Even Senators and Representatives in Congress often had difficulty in seeing him at the times and in the manner they desired, and frequently accepted "pot-luck" with the crowd in the public reception-room. Colonel Hardie, a handsome Scotch-looking officer, took charge of this room early in the morning and, in the name and by authority of the Secretary, dispatched the business of such as neither needed nor insisted upon the personal action of the Secretary. He also sent in the names of such callers as he thought the Secretary would privately receive and, from time to time, went in himself to take the Secretary's commands upon some case of special difficulty or importance. As nearly as possible to eleven o'clock, the Secretary, who had an almost religious regard for this daily observance, came into the room and took station at the little, high desk near the bottom, Colonel Hardie or Major Pelouze being in attendance to assist him. He waved everybody back who approached him, until he had completed a deliberate scrutiny of the company and had received from the officer in attendance a statement, in a low voice, of the exceptionally urgent or meritorious cases. Then, one after another, he indicated those whom he wished to draw near, beginning with the soldiers, and, after them, calling up the plainly dressed women who looked as if they might be soldiers' kinfolk. If he happened to notice that a soldier had crutches or was weak from illness, he would leave the desk and go to him where he was seated. Officers bearing visible tokens of wounds or disability were also preferred suitors, but with other gentlemen of the shoulder-strap he was usually curt. Civilians he treated accordingly as his humor was affected by their statements or manner, but there was always a general observance of the underlying principle that

this public reception was for those who had no other means of access to him. It was here that Mr. Stanton might usually be seen at his best. If a case of unusual gallantry, merit, or suffering were stated, he would comment upon it aloud to the company, ending with a moral, inviting to patriotism, virtue, or fortitude. On the other hand, if he found a woman-suppliant embarrassed by the publicity of statement and action, he would draw her beyond the desk to the window-recess and hear her there, or send her to his room to be heard more leisurely or privately. Some of us used to think, while watching the Secretary at these receptions, that a great power had been lost to the pulpit when he became a lawyer; for he was an admirable preacher and far from averse to sermonizing.

Three mornings a week, in continuance of a custom begun before the war, Mr. Stanton, accompanied by a man-servant, visited the city market in the character of caterer for his household. Politics among the stallholders was of a divided kind, and the Secretary, who knew how each of his purveyors stood, fashioned his gossip with them accordingly. With the Confederate sympathizers he usually assumed a bantering tone, wherein, however, he found opportunity now and then of enjoining a strict neutrality upon all but their tongues. His playful threats of incarceration in the Old Capitol the garrulous ones were fond of repeating to neighbors and customers, with defiant comments of their own. With the Union marketmen he was more serious, often gratifying them with scraps of hopeful news or prognostications. He was sometimes followed around the market-house, at a respectful distance, by a small crowd of reporters and curbstone speculators in gold, in quest of "points," but his humble confidants were generally as mute as the Sphinx. After the exchange of prisoners was stopped, attempts were made to use some of the market-people to solicit special exchanges for Confederate captives, but Mr. Stanton, making allowance for the pressure exerted, kindly put the solicitations aside and forbade their recurrence. Where a personal or family interest existed, he was ready to hear and sometimes to relieve. The stalls of the disloyal marketmen were veritable depots for underground news from the Confederacy, and it is not unlikely that the astute Secretary occasionally got some "points" of value to himself from the more talkative of these tradesmen.

In 1864 Mr. Stanton ordered that thereafter captured Confederate flags should be accompanied to Washington by the individual or parties engaged in each capture. As soon

as informed of the arrival of a collection of such trophies, he organized a little ceremony in the public reception-room. An hour would be appointed for receiving the standards, and he would get together a small company of notables. Taking his stand at the tall desk, each flag would be brought before him in succession, and he would demand the story of its capture, which the captor would give, flag and staff in hand. The Secretary would keep up a running commentary of mingled surprise and gratification; would occasionally stop the narrative and call for a repetition of some part which struck his fancy, and, at the close, would shake the narrator warmly by the hand, introduce him to each of the distinguished persons in the room, and repeatedly tell him that he was a gallant fellow. Sometimes he would shake hands over and over again with the same man, commending the courage of his action and the modesty of his account of it. Again and again he would refer to their coming from different States, but belonging to one country, and this theme he played upon so variously during each ceremony that he must have had a suspicion of the existence of sectionalism in the armies. When all the flags had been presented and all the stories told, he would turn to the Adjutant-General (who was in attendance and in uniform), and in an impressive voice direct him to make out for each man a furlough for thirty days, with transportation at the public expense to his home and back to his station, and an order on the Paymaster-General for one month's pay in advance; also to cause medals of honor to be prepared and sent to each captor, with due publication of the fact in general orders. Then with more handshakings, compliments, and patriotic allusions, the visitors would withdraw in the company of the Adjutant-General, all blushes, confusion, and delightful anticipation.

At the time I entered the department a gloomy tone pervaded it, which would have been much more noticed and felt by others than the chiefs if incessant and ever-growing routine business had not afforded mental distraction. Not for a day nor an hour did the pressure for army appointments and contracts relax, so that no matter how things went in the field, in the department at Washington they went the same from one day to another. General Halleck at last warned the Secretary of War that the excessive number of paymasters, quartermasters, commissaries, and assistant adjutant-generals appointed to the volunteer forces was an administrative calamity, apart from the useless expense, which was not his concern. The chiefs of bureaus protested that outstanding contracts for the favorite articles of supply ran far ahead of the public necessity.

Assistant Secretary Harrington, the practical man of the Treasury Department, came over with schedules and statements which showed that the expenses of the Government were at the rate of one and a half million dollars per day, that the new loans were stagnant, and that the banks were getting alarmed at the extent to which their resources were locked up in the certificates of indebtedness that the Treasury had been obliged to use in settling with public creditors. So far as the War Department was concerned, the trouble lay not in the expense of the troops actually in the field or in garrison, but in the multitude of establishments in the rear, reaching from Maine to California, and sheltering a mixed staff of military and civil employees that rivaled in numbers the men who marched and fought.

In each congressional district a multitude of local interests was bound up with these establishments, and not one could be abolished or reduced without raising a deafening clamor at Washington. It was the supervision and control of these indispensable yet costly auxiliaries that robbed the Secretary of needed repose in the intervals of the great duties of his office; for an appeal was sure to be taken to him from every important act of the local administration. His office was choked with inspection reports, filled with evidences of inefficiency and extravagance, and with projects of reform, and the custodian of them used to have the more important set up in large type in a secluded printing-office, and a single impression struck off, so that the Secretary could read them in his carriage, or in his library or bedroom at home. But all retrenchment had to await the November presidential election, for the Administration took a serious view of General McClellan's prospects, and did not feel strong enough to offend the pettiest political magnate. Mr. Chase had a large following which was not friendly to President Lincoln, and the military situation for the moment gave color to the Democratic declaration that nearly four years of war had failed to restore the Union. Early in October, from some cause that I never fathomed, a subterranean panic seized upon the leaders and lasted a good fortnight at least. The Assistant Secretary of War, who had charge of the internal economy of the department, began dismissing clerks accused of offensive "McClellanism," but this did not meet the Secretary's approval. Doubtless Mr. Stanton knew fairly well the extent to which quiet partisanship for McClellan pervaded his entire department, but politics under him was as free as religion, so long as fidelity and industry accompanied it. The chief of his military staff, Colonel Hardie, came to him fresh from cordial and confiden-

tial service on the staff of the deposed General McClellan, and General Fry, the provost marshal-general, whose duties and powers were more important and delicate than those of any other officer in the department, had been chief of staff to General Buell up to the time when the latter's active career had been terminated by the Secretary.

Early in 1869, a former clerk in his office called upon the ex-Secretary to solicit his influence in the matter of an appointment he was seeking from President Grant. His request was so warmly received that with an awkward honesty of purpose he blurted out, "You know, Mr. Secretary" (his late subordinates usually so addressed him after his retirement), "that I used to belong to the Army of the Potomac, and perhaps I ought to say that I have always been a warm adherent of General McClellan." Mr. Stanton was plainly enough annoyed at the unexpected diversion of the conversation, but he quietly answered, "That is your business, sir, not mine. You served me faithfully, and whenever or wherever I can serve you, I will do so gladly." Then, seeing the distress and repentance of his visitor, he resumed his interrupted cordiality, and, with a touch of old-time habits, sent him away at ease by having lifted a bit of the curtain that hid the business of state. One of his staff-officers, now dead, told me how the Secretary had "stampeded" him one day during that autumn of 1864, by quietly remarking to him, after an unusual display of petulancy, "Never mind, major! when your friend McClellan gets into the White House, you'll be rid of me."

Speaking of his political tolerance, it is proper to remember that Mr. Stanton entered President Lincoln's cabinet as a life-long Democrat, and it was his humor always to regard himself as still a member of the Democratic party. As late as the winter of 1866-67, in the course of a short conversation with the then Senator Hendricks, with whom he maintained cordial relations throughout the war, he rather surprised that gentleman by discussing with him the political situation as though he had a partisan's interest in the forthcoming Democratic nomination to the presidency. He was accustomed to appeal privately to leading Democrats in Congress to forward passively, when they could not actively, the indispensable war measures of the Government; he refrained from gratifying himself or his party friends by patronage; he cherished to the end of his life old political associations and friendships — more than one Democratic worker in Pennsylvania in 1863 and 1864 carried in his pocket an autograph letter from the Secretary of War, guaranteeing any free-

dom of speech and of the press that did not promote disloyalty or incite resistance to the operations of government; and he never came nearer to confessing himself a convert to the party he was serving than by an occasional lamentation that the war had broken up the party lines and issues as he used to know them.

Mr. Stanton was always and before everything a lawyer. He idealized and deified the Law and magnified, I suspect, both the capabilities and achievements of his class. Eminence as a lawyer was any man's best recommendation to him. He doubtless appreciated in Generals Halleck and Canby the technical military knowledge which he never had nor cared to have, but it was their legal attainments that placed them so high and kept them so steadily in his esteem. It pleased him to have people mention with interest the little tin sign bearing his name and profession which all during his public career remained upon the building opposite the Treasury where in his law-office had been. While in practice he shrunk from no exercise of power that the public welfare or the public necessity seemed to demand, he was delighted to have that clever and industrious Boston lawyer, Mr. Whiting, find a legal warrant for every proper exercise of authority in the theretofore unexplored and unsuspected war powers of the President under the Constitution. He gave Dr. Lieber a liberal honorarium for preparing those rules for the government of armies in the field which supplied a sound legal basis for what officers and soldiers were doing upon necessity. "Whiting's Powers" and "Lieber's Rules" were jest-books about the department, but their continued vitality and authority prove how sound and timely were the legal instincts of Mr. Stanton in calling them into existence.

One day a prominent Senator made his way into the Secretary's presence, full of fury against the Quartermaster-General.

"Stanton," he roared out, "I wonder how a lawyer, as you are, can keep that man Meigs where he is. Why! he pays no regard to either law or justice."

Mr. Stanton looked at his excited visitor and replied, dryly:

"Now, don't you say a word against Meigs. He is the most useful man I have about me. True, he isn't a lawyer, and therefore he does many things that I wouldn't dare to do."

"Then why in the name of heaven do you let him do them?" demanded the Senator.

"Somebody *has* to do them," quietly answered the Secretary.

Mr. Stanton never reconciled himself to military methods, nor learned to esteem the military profession as a permanent instrument of civilization. Accustomed as a lawyer to do

everything in person and in his own way, the delay and precision inseparable from public administration always chafed him. The official conservator of routine in the War Department is the Adjutant-General; and General Townsend, who filled that office during the war, was an even-tempered man, with an ideal respect for authority that never permitted him to palter with orders, and an ideal respect for precedent that never permitted him to depart from tradition in their execution; and of the traditions of the army he was the store-house from which all engaged in military administration at times supplied themselves. The Secretary was greatly attached to his Adjutant-General, scolding him oftener than any other of his subordinates, sharing more confidences with him, and, while forever breaking down his barriers of tradition and routine, constantly taking his opinion in private upon questions or acts under discussion or in contemplation. Mr. Stanton was surrounded and kept himself surrounded by military officers, and despite the incessant war of conflicting habits and methods, there was much mutual esteem. He once humorously described his situation as that of the man betwixt the devil and the deep sea—if he escaped the bottomless pit of chaos, he fell into the fathomless gulf of circumlocution. His open preference for the private soldier to the wearer of shoulder-straps (a preference opposed to both reason and experience and, in his case, free from the usual taint of demagogism) was due to his conception of military force as a necessary evil; still an evil, however necessary. If I might venture to put into phrase his art of war as I have heard him variously expound it, it would read something like this: "Get together all the men you can and move against the enemy; if he retreats, follow him and fight him till he breaks up or surrenders; if he resists, fight him till he retreats." He once closed a technical and animated discussion, in his presence, of the respective merits of muzzle and breech loading rifles by the remark: "Gentlemen, it's the man behind the gun that makes all the difference worth talking about."

Mr. Stanton repeatedly bestowed military appointments upon persons in civil life, charged with civic duties, because the emoluments of such appointments were the readiest means at hand of recognizing faithful or valuable service. Baker, the chief of the military detective service, was, in truth, a faithful and valuable public servant, and as he held the rank of colonel of volunteers, the Secretary saw no reason why he should not have a brevet promotion, on retiring from the service, just as paymasters, commissaries, and surgeons were having brevets. To his legally constituted mind a brevet brig-

adier (being an official without either authority, duty, or pay as such) was as great an anomaly as a brevet judge would have been; and hence, after keeping the law authorizing brevets in abeyance till military pressure became irresistible, he opened the gates, at the close of the war, and said in effect: "Here is something that means nothing and costs nothing; take all you want." True, he did at first prescribe that brevets should only be conferred on the recommendation of boards of officers, or, subsequently, of the chain of commanding officers of each aspirant, and he originally limited brevet promotion to one grade for each person breveted; but these methods were too slow and too sparing for the multitude of aspirants, and as he did not care enough about the matter in a public or personal sense to buffet with Congressmen, who naturally wanted everything they could get for their soldier constituents, he practically abandoned the whole business to a clerk in his office, who made up schedules as best he could from which the Adjutant-General prepared the official papers. So loosely was the brevetting done that a party of departmental clerks, for a lark, undertook to get a companion and butt of theirs breveted from his late rank of first-lieutenant to the grade of brigadier-general, and had actually obtained for him the several brevet commissions of captain, major, and lieutenant-colonel when he became fearful of detection and exposure, and gave a royal "spread" to his benefactors as the price of their services and silence. I am bound to say that his extraordinary elevation made a man of him, for some wealthy relatives took him up, on hearing of the honors showered upon him, established him in business, and helped him to a desirable marriage, and "the colonel" has been all that a colonel ought to be ever since.

Mr. Stanton's mental characteristics accorded exactly with his past career. He was a self-made man, and had been a highly successful lawyer and advocate. Hence his energy, self-reliance, gravity, and taciturnity. Hence, too, his minute suspiciousness, for he had grappled with extraordinary fabrications of documents and with perjury of the most cunning order in his investigation of the California land-titles. Hence, too, I imagine, his dramatic tendencies, which were perpetually cropping out. Hence, too, his normal aggressiveness; for as Secretary of War he seemed to regard himself as holding a brief for the Government and to be bent on bringing his client out successful, leaving everybody else to look out for himself and to get in the way at his peril. This concentration and intensity of his mind on the single object of crushing the rebellion must explain much of his

seeming harshness to and neglect of individuals. He liked many persons and disliked very few. Messrs. Davis, Toombs, Yancey, Thompson, Floyd, and Breckinridge were all, or nearly all, of the leaders of the rebellion that he seemed to have any personal resentment against. He spoke sympathetically of the situation of Governor Vance, who had been captured and brought before him as a prisoner, though he had borne himself stiffly while the governor was present. At the solicitation of Mr. Garrett, he interested himself in getting a special pardon for General Kirby Smith, because of his poverty after conducting large cotton operations for the Confederate Government, and because of Canby's praise of his scrupulous fidelity in executing the surrender of the Trans-Mississippi Department. He permitted an impoverished gentleman who had held civil office at Richmond to bring a valuable law library to the North, and assisted him to an advantageous sale of it. He protected a needy lady who was threatened with dismissal from public employment because her husband was (against her will) serving in the Confederate army. The late Judge Roane, of Alabama, told me that when his State seceded he went to Mr. Stanton, who, after some violent language about Yancey and some others, and the ruin they were bringing on innocent men, told him he saw nothing else for him to do but to resign his office at Washington, go home and take care of his family and do as little harm to the Government or his people as he could. When he saw Roane after the war and heard that he had accepted a place in one of the departments at Richmond as a partial means of support, he only remarked, "A man must live." With the exceptions I have named, I do not believe that he had any especial or individual feeling against those engaged in the rebellion, and that he never had any thought or purpose beyond restoring the Union and making it secure. When, in the early days of his heat against the Southern leaders, President Johnson refused to permit General Joseph E. Johnston to visit his sister in Canada without forfeiting his right to remain in the United States, Mr. Stanton, whose own power of refusal was ample, before handing the paper back to General Grant, who, in company with General Sherman, had recommended the desired extension of General Johnston's parole, indorsed on the paper a minute that the refusal was at the personal order of the President.

The unhappy relations that grew up between Secretary Stanton and General McClellan are, I think, most reasonably to be explained by the overwhelming devotion of the former to the advocate's idea of duty to a client. He entered office on the best of terms

with the young General-in-Chief, but they soon drifted apart. The choice of the Peninsular route for the advance on Richmond entirely shattered the Secretary's confidence in his late military ideal, and the retreat to the James River, and the seemingly aimless and endless sojourn there under the protection of the navy, appeared to confirm all of Mr. Stanton's moody anticipations and gave him an ascendancy in the Government that was, however, speedily overturned by the disaster to his own general, Pope. He fought bitterly then, as his cabinet memoranda show, against the restoration of McClellan, but people, generally, had neither his convictions nor his stern courage, and the President overruled him for the moment. He was again overruled in the appointment of General Hooker; but that was the last time, and not even the transcendent influence of General Grant at a later day could suffice to recall General McClellan to the field a second time.

If Mr. Stanton had any marked intellectual tastes dissociated from the law I never discovered or heard of them. He was fond of novels, especially those of Dickens, but he read them, as he said, to relax and clear his mind. He liked also the conversation of accomplished men, and, before the war, had built himself a house, larger than his means warranted, in order that he might assemble them around his table and give them suitable entertainment. Even during the war, no matter how onerous or anxious his duties at the moment might be, he was always ready to meet at his own or some other table men of real eminence in any field who might be visiting Washington. Among his colleagues of the cabinet he maintained intimate relations with Mr. Seward, whose volatile nature had a strong attraction for his own Puritanical soul.

Mr. Stanton was a profoundly pious man and carried his belief in predestination and special providence so far that he might have been a fatalist, except for the teachings of his own active life and the robustness and activity of a mind that was incapable of passiveness. In his eyes the American Union was a providential scheme for working out the happiness of mankind, and therefore, while he never despaired of the republic, the attempt to break it up appeared to him to be sacrilegious, and herein probably lay the secret of his vindictiveness against the men whom he felt warranted in holding guilty of stirring up a rebellion.

With all his religious fervor, Mr. Stanton was a tolerant man in religion, as I have shown him to have been in politics. As the Federal armies penetrated and spread themselves over the South, there was much unavoidable dis-

tress and disturbance of the Roman Catholic conventual establishments connected with education and charity, and the sisterhoods, and often priests in charge of congregations, would appeal to the Archbishop of Baltimore for aid in getting their lot in various ways ameliorated by the authorities at Washington. The archbishop would transmit the more urgent and meritorious of these appeals to Colonel Hardie, chief of the military staff at the War Department and a devout Catholic, who would submit them to the Secretary, being unwilling to assume any responsibility himself in matters that touched him so closely. Colonel Hardie has told me how surprised he used to be at the patience and liberality of Mr. Stanton in dealing with these appeals, and how, upon one occasion, when he expressed a fear that he was exposing himself to censure in making himself the repeated vehicle of such applications, the Secretary put him at his ease by replying: "I shall censure you when you fail in your duty of bringing all necessary and proper matters to my attention,—these included."

This is perhaps a good place to refer to a belief that has gained some foothold, that Mr. Stanton was especially concerned in bringing about the conviction or the execution of Mrs. Surratt, and that he afterward was stricken by remorse for his part in her painful death. It is true that, after her conviction, he did refuse to interfere in any way with the execution of her sentence, even when importuned by her pale-faced, weeping daughter again and again, till he was obliged either to yield or to deny admittance to the suppliant; and it is true that, relying upon his own legal training and experience, he personally subjected the witness Weichman, upon whose testimony Mrs. Surratt was chiefly convicted, to a searching examination to test the accuracy and trustworthiness of his statements. Beyond these he had, from beginning to end, no especial relations toward the case of Mrs. Surratt. Doubtless he shared the national repugnance of his countrymen to the hanging of women, and I infer this from his expressed disgust at the applications made to him for passes to witness her execution. After his retirement he was not chary of admitting his mistakes made in office, but he certainly died in ignorance of remorse, or any ground for remorse, on the part of himself or anybody else, in connection with the fate of Mrs. Surratt. It is only fair to say that he did take an active part in the subsequent trial of her son, and made no concealment of his chagrin at the failure of the expected conviction.

I have spoken of Mr. Stanton's self-reliance. The defeat of Rosecrans at Chickamauga was

believed at Washington to imperil East Tennessee, and the Secretary was urgent to send a strong reënforcement there from the Army of the Potomac. General Halleck contended that it was impossible to get an effective reënforcement there in time, and the President, after hearing both sides, accepted the judgment of Halleck. Mr. Stanton then put off the decision till evening, when he and Halleck were to be ready with details to support their conclusions. The Secretary then sent for Colonel McCallum, who was neither a lawyer nor a strategist, but a master of railway science. He showed McCallum how many officers, men, horses, and pieces of artillery, and how much baggage it was proposed to move from the Rapidan to the Tennessee, and asked him to name the shortest time he would undertake to do it in if his life depended on it. McCallum made some rapid calculations, jotted down some projects connected with the move, and named a time within that which Halleck had admitted would be soon enough if it were only possible; this time being conditioned on his being able to control everything that he could reach. The Secretary was delighted, told him he would make him a brigadier-general the day that the last train was safely unloaded, put him on his mettle by telling him of Halleck's assertion that the thing was beyond human power, told him to go and work out final calculations and projects, and to begin preliminary measures, using his name and authority everywhere; and finally instructed him what to do and say when he should send for him by and by to come over to the department. When the conference was resumed and McCallum was introduced, his apparently spontaneous demonstration of how easily and surely the impossible thing could be done convinced the two skeptics, and the movement was ordered and made, and figures now in military science as a grand piece of strategy.

The Secretary was not without a sense of humor, as the following anecdote will show. It was reported to him that an officer from the front was in Washington under an assumed name and rank, in a false uniform and with a forged pass, and had been heard to utter obscure threats against some of the heads of the Government. He had the accused person looked up, arrested, and brought before him, and it happened that he was in the public reception-room when the prisoner arrived. A few stern and searching questions and a demand for the prisoner's papers brought out the facts. The "conspirator" was a lieutenant of volunteers who had overstaid a leave of absence and was masquerading in the uniform and credentials of a field-officer while making ducks and drakes of a few hundred dollars

which had come into his possession, and the threats were the frothy parts of a beery discussion with some brother officers over the perennial subject of the merits and demerits of McClellan, Burnside, and Hooker, the shelved commanders of the army to which the inebriates all belonged. The Secretary called in a tall, grisly sergeant of dragoons, whom he was accustomed to use for hard or perilous courier service, and in a sepulchral voice bade him go fetch his saber. At these words the malefactor turned pale and the bystanders were filled with a variety of emotions, ranging from curiosity to terror. The saber was brought and the edge of it solemnly scrutinized and felt by the Secretary. Still holding the saber, he directed the sergeant to tear from the prisoner's coat the gilt buttons and false shoulder-straps. Then handing him the naked blade, he said, "Sergeant, take this *fellow* to the Old Capitol in one of the wagons, and tell Colonel Wood to keep him there till I direct his release. If he attempts to escape, cut him down, by my orders." These dreadful words did not, in truth, mean perpetual or even indefinite imprisonment. The Secretary knew that the case would come before the jail deliverer, Judge Advocate Turner, the very next morning, and that, in a day or two, an order of dismissal from the service would result, and the offender be set at large.

The Secretary, however, was not always so grim in his pleasantries. An orderly, lounging at the watchman's desk and scribbling on the blotting-pad, idly scrawled a rude imitation of the Secretary's autograph, and, impelled by some demon of mischief, added a profane and insulting epithet to it. The microscopical eye of the Secretary soon detected the libelous inscription, and the terrified door-keeper gave up the name of the person whom he rightly suspected of the authorship. "Bad news travels fast," and before the Secretary could reach the station of the culprit, *en route* to his own room, Smith was on the upper floor of the building, a panting fugitive. For a full week he lived a life of suspense and furtiveness, without a word or a sign from the offended magnate, who was full of business, and might be presumed to have forgotten the matter. But as soon as Mr. Stanton laid his eye upon Smith he invited him into his private room and demanded the whole truth and nothing else. He soon became satisfied that the inscription was nothing but a piece of idle mischief, and a few more questions informed him of the trembler's good record in the field and the department, and of his possession of a wife and children. The Secretary then began to rail at him for so publicly caricaturing his handsome signature,

and, for a moment, led the poor fellow to believe that he had a schoolmaster's pride in his up and down strokes; the truth being that while the Secretary was capable, by an effort, of writing a bold and legible back hand, his ordinary chirography was decidedly loose in character.

If I were to attempt, from his conversations, to name types of the kinds of men that Mr. Stanton admired, I should select Governor Morton, Secretary Fessenden, Senator Zachariah Chandler, and General Sheridan. Ruggedness was a characteristic that attracted instead of repelled him, as witness his active friendship for the scarred, cynical, and penniless exile, Gurowski, perhaps the queerest of many queer characters that have made Washington their abiding-place. For Mr. Lincoln the Secretary had an esteem and affection that put their relations entirely apart from those which he formed or maintained with any other man of the period.

Even if President Lincoln had lived, it is improbable that Mr. Stanton would have continued at the War Office long after the return of peace. He did not like administration, and in ordinary times would no doubt have preferred the Attorney-Generalship to any other office in the cabinet. Nor did he like politics, and the little talk there was at one time of his

entering the Senate when he could be spared from the War Department never found an echo with him. Doubtless he hoped to find a place in the Supreme Court when he could properly leave the cabinet of his chieftain and friend; and considering his almost fanatical devotion to the law, he ought to have made his mark in the annals of that high tribunal. But his health was so precarious till a period subsequent to Mr. Lincoln's death that he probably thought little at that time about his earthly future. The length and manner of his continuance in Mr. Johnson's cabinet was of course entirely unpremeditated from one stage to another. I feel warranted in adding that it was against both his wishes and his judgment, and I know that he lived to regret this one conspicuous instance in which he permitted others to decide what his duty was at a great emergency.

When, on the failure of the impeachment of the President, Mr. Stanton abandoned the War Department, he was a beggar not only in health but in fortune; even the one dwelling that he possessed was heavily mortgaged, and so continued till his death brought the true state of his affairs to light, and gave able and willing friends an opportunity to do what they would have been glad to do earlier, except for his own proud silence.

Charles F. Benjamin.

THE CLOCK OF THE UNIVERSE.

SWING, swang, the pendulum goes
Of the clock æonian, steady and tall,
That, backed by Creation's flaming wall,
Stands at the foot of the dim, wide stair!
Swing, swang; here—there!
Its tick and its tack like the sledging blows
Of Tubal Cain, the artisan—
Though they strike on the anvil of no man's ear;
On the heart, on the human heart they fall,
With a sound of blessing, a sound of ban,
Each blow a hope, each blow a fear,
Swing, swang, the pendulum,
With a far-off, dreamy hum,
And a tick-tack, almost dumb—
Tick, tack, fetch and come,
Goes the pendulum!

Dark is the clock's deep, mystical face,
Filled with a brooding, hearkening grace;
The stars dream in, and sink fainting out,
And the sun and the moon go walking about,
Solemn and slow at a thinking pace,
Walking, walking about.

Two hands, together joined in prayer,
Uplift to the lightning and the thunder;
Two hands, in hope spread half asunder,

An empty gulf of longing embrace;
Two hands, wide apart as they can fare,
In a fear that coasts, never lands in despair,
But turns again, back again, ever to prayer;
Two hands, human hands, pass with awful
motion,
From island to island, across the face-ocean.

With opening beak and quivering wing,
Eager out of its door to spring,
Tiptoe stands the cock that crows—
The golden cock with triumphant call,
Clear as a trumpet rending the sky—
When the hands at length are joined on high,
In a silent, despairing, hoping cry,
The prayer supreme of the universe,
When the darkness eternal will not disperse,
And the cross itself seems a writhing curse;
Tick, tack, to the waiting cock,
Tick, tack, goes the ages-clock!

A polar bear, golden and gray,
Is crawling ever around the top.
Black and black as an Ethiop,
The great sea-serpent lies coiled beneath—
Living, living—and does not breathe.

And the crawling bear is so far away
That we cannot hear, all night, all day,
The burden big of his bear-like bass,
Roaring atop of the silent face.

Eat up old Time, O raging bear!
Clutch the Baldhead, and in pieces tear;
Lie still, dark serpent, nor let one breath
Stir thy pool and trouble his death;
Steady, hands, for the morn is nigh;
See the silvery ghost of the dawning shy,

Low on the floor of the level sky!
Soon ye will point to the zenith high.

Be ready to strike, O blessed clock!
Gather thy clarion breath, gold cock!
Push on the month-figures, pale, weary-faced
moon!

Tick, awful pendulum, tick amain!
And soon, oh, soon,
Lord of life, and Father of boon,
Give us our own in our arms again!

George MacDonald.

THE WHITE MAN OF THE NEW SOUTH.

THE New South is already an old theme. As the title of an article, or the theme of a public address, it has come to mean a discussion of the negro problem. Indeed, most articles that have appeared on this subject, whether from Northern or Southern writers, have confined themselves almost exclusively to a presentation and discussion of this phase of the subject. But, without meaning thereby to underestimate the importance of this great race-problem to the civilization of the New South, we yet purpose to confine ourselves in this paper to a presentation of the white man of the New South and the New South of the white man. We shall not even discuss the white man of the Old South, except by way of contrast with the present. If this article, therefore, should seem to fail to recognize the chivalry, the hospitality, the high sense of honor, and the many other moral and social virtues that characterized the Southern gentleman of the olden time, let it not be misunderstood. Our study is in the present, and our face is turned toward the future, not toward the past. This much we say because the comparison and contrast here instituted must needs be unfavorable to the white man of the Old South in those points of character of which this article shall take cognizance.

Indeed, it is the white man of the South more than the black that has been freed by the civil war; and the greatest blessing which has thus far resulted to the South from the emancipation of the Southern slaves is its effect upon the white man of that region in transforming him from a dependent idler, or "gentleman of leisure," supported by his slaves, into an independent, self-reliant worker. We speak of the typical, representative Southern white man, not of all classes; for there were

working white men in the Old South and there are idle white men in the New. But the white man of the New South is preëminently a worker as compared with the white man of the Old South, who, if not an idler, was at least a man of multitudinous leisure. But having now been set free from that bondage to leisure and that contempt of labor which is inseparable from slave-holding, the representative of that region has become a new man, and has entered upon a new probation among the industrious races of the earth. If the Old South had a contempt for the worker, the New South has a greater contempt for the do-nothing and the idler—for the man who does no honest work, it matters not how white his skin or how full his exchequer. The "gentleman idler" has lost caste in the South; he is an institution of the past.

What is called, and rightly so, the New South is connected far more closely with the new life and labor of the white man of the South than with the emancipation and labor of the freedmen. The negroes of the South have thus far as a rule worked no more and no better since their freedom than before. Indeed, seeing that the first reaction from a state of slavery and compulsory labor is naturally and inevitably toward indolence, we may say truthfully, and say not so much in blame as in pity for them in their condition, that the present generation of freedmen have perhaps not worked so much or so well as they were compelled to do before they received their freedom. This, however, owing to the upward tendency of freedom and education, will doubtless not be true of succeeding generations, as indeed it is not of many belonging to this generation. Their attention and efforts have thus far been directed almost exclusively to themselves, to their own support, to their own mental, moral, and social improvement as a race, and to the securing and increasing of their recognized rights. This is as

it should have been; it could not have been otherwise, and it is likely to be thus for at least a quarter of a century to come. But the white man of the South thinks less concerning himself and more concerning the common good than ever before. While he perhaps values his own property more and works harder to increase it than ever before, he yet has more public spirit and enterprise and more desire to see his region developed than he did before he became the working-man he now is. Hence, we say the New South is that of the white man.

For the first ten years after the war the South was wearing the black garb of mourning and was in sorrow over the "lost cause," and refused to be comforted. It was the period when the "Conquered Banner" and Father Ryan's other mournful threnodies voiced forth the only feelings and sentiments that filled the Southern white man's breast; it was the period of reconstruction and adaptation to the new conditions of life and labor. The white man had no heart to work then, and what work he did was not the result of hopeful endeavor and healthful enterprise, but of dire necessity. It was not until a decade of years had passed that he laid aside his garb of mourning and went really and earnestly to work, having learned now to adapt himself to the conditions and environments of the new civilization; and now that the second decade of the new order has ended, we are beginning to see the results of the new spirit of life and labor that has been infused into the Southern white man by the emancipation of his former slaves.

The New South, therefore,—the industrial, intellectual, and religious New South,—of which we here speak began properly at the close of the first decade after the war, in 1875; it began to show itself first in 1880; and by 1886 it has proved its name by evidences so powerful and convincing that only the blindest can fail to see them. It is our purpose to show, by presenting a few carefully selected facts and figures, that such a marvelous advance has been made in the South in the last ten years as has rarely been made in any country or in any part of any country in an equally limited period in the history of the world. It is true that the manner in which some of the Southern States have dealt with their debts seems irreconcilable with any worthy claim to remarkable material prosperity; and even if this were otherwise, the recuperation of the South, it may be said, cannot be compared with the phenomenal rapidity with which France redeemed herself, at least in appearances, from the enormous debt incurred in the Franco-Prussian war. But then that startling settlement was only apparent and not real, at least so far as the national government was

concerned; for the debt was simply transferred from abroad to its own people at home. That this could be done and was done is eminently to its credit, it is true. But France is to-day the most hopelessly involved in debt of all the nations of Europe, and this is a result of the Franco-Prussian war. So this phenomenal settlement of its enormous debt was something of a "Mississippi Bubble" after all, and therefore cannot be used to offset our claim of an almost unprecedented prosperity in certain portions of the Southern States in the last ten years. But if any one be disposed to say that the first recognition of a claim to material prosperity in a nation or state should be based upon its settlement of its lawfully contracted debts, and should insist on applying this righteous test to the claim of remarkable prosperity in the New South, we shall not deny the justness of his criticism. But this we will say: it is not the working white people of the South that have desired or voted for repudiation or readjustment. If left to the vote of the white man, the debts of Virginia and Tennessee would long since have been fairly adjusted, if not entirely paid. Be it said to their honor and honesty, it was not the property-owners, those that would have had the debt to pay, who as a class voted for readjustment and repudiation.

But that a most wonderful impetus has been given to Southern life and industry in the last few years, and that the South has already entered upon an era of unprecedented prosperity, there is the most abundant and varied evidence to show. This prosperity rests upon a more permanent basis than that of *ante-bellum* times, which always carried within itself the direful prophecy of its own coming ruin. We shall now show what the New South has done and is doing,—first, in the development of those varied and diversified industries that indicate material prosperity; secondly, in the departments of education and literature, and thirdly, in the sphere of morals and religion,—and also show how it is all connected most intimately with the emancipation of the white man of the South from that bondage to idleness and contempt of labor that is inseparable from the ownership of slaves. We shall see that in physical, intellectual, and moral manhood the white man of the South, having shaken off the shackles of his bondage and rejoicing in his liberty, has joined the other freemen of the earth in running a nobler and better race in life. To change our figure to one more prosaic and true to life, he has set himself earnestly to work.

I. We consider first the evidences of material prosperity as indicated by the increase in the production of the two leading Southern staples, cotton and tobacco, and by the in-

roduction and development in the South of wealth-producing industries.

King Cotton's days of prosperity, it was gravely predicted, would end forever with the emancipation of the slaves. But the South raises *thirty per cent.* more cotton to-day than it ever did before the war, and raises it on a smaller number of acres. And note the increase of white labor in the production of the cotton crop. Before the war white labor produced only ten per cent. of this staple; in 1883, forty-four per cent.; in 1884, forty-eight per cent.; in 1885, over fifty per cent. The cause of this change is threefold: (1) the increase in the production of cotton in new States, like Texas, where white labor predominates; (2) the tendency of the colored population in many parts of the South to leave the country and seek residence in the larger towns and cities; (3) the fact that the white man of the New South has gone to work—to work in the cotton fields as well as everywhere else. And yet, notwithstanding this increase in the production of this greatest of Southern staples, cotton is no longer king. Happily for the South, its supremacy is at an end. A hundred new and diversified industries are now bringing untold millions of dollars annually into the South, far more than the cotton crop is, whereas before the war cotton was almost the only source of revenue. The last reported tobacco crop yielded the South thirty-three million dollars, which is certainly three or four times as much as before the war, though we have not the figures for the latter. The proportion of this staple produced by white labor is quite as large if not larger than that of cotton.

Closely connected with the agricultural prosperity of the New South may be noted the rapidly increasing division of the large plantations of former times into smaller and more thoroughly cultivated farms. The greatest evil in the farming of the South for many years after the war was the tendency to raise cotton or tobacco exclusively, and buy all foodstuffs. The reason for this was found in the impoverished condition of the farmer and the fact that he could borrow money in advance on these crops when he could not on breadstuffs. The cotton and tobacco crops were often mortgaged while yet in the field to buy bread for man and hay for beast that should have been raised by the farmer himself. In some cases these crops were mortgaged before they were even planted, to pay for fertilizers. This system made the farmer entirely dependent, when, of all men, he should be independent, at least in providing the necessities of life. But this evil has well-nigh disappeared. The South can now feed itself, and in a few years will do so entirely.

The statistics for corn and oats show that the South, as compared with the North and West, raises its proportion of the former and more than its proportion of the latter, while the showing for wheat is not unfavorable. It is also beginning to raise its own hay. The South, rich in all kinds of agricultural resources, should, as it will before long, be exporting, not importing, these things.

Among the new and profitable industries that have started in the South since the war may be mentioned fruit-raising, truck-farming, market-gardening, and stock-raising. The wonderful but until recently unrecognized adaptation and advantages of the South for this last-named industry are being rapidly brought to public notice. It is of course easier to winter cattle in the South than anywhere else. The South has to-day two hundred million dollars more invested in live stock than it had in 1875, being an increase of nearly fifty per cent. in ten years. And it is encouraging to note that the finer breeds of cattle are everywhere supplanting the inferior breeds. The "raw-boned" horse, the "scrub" cow, and the "razor-backed" hog are fast disappearing. Again, the timber, lumber, and wood-work industry is also worthy of special mention as one of the most promising and profitable of those that have been started in the South in recent years.

But it is in the development of manufactures of various kinds that the South has grown most rapidly and extensively. Before the war the South was so exclusively agricultural that it was long thought that it was adapted only to agriculture. But it is now found that in adaptation to manufactures of most kinds the South is not surpassed, if equaled, by any other part of the United States. It has been shown by repeated experiments and well-attested results that cotton can be manufactured from three to five dollars cheaper per bale in the South than in New England. The time was when all the cotton of the South was sent North, chiefly to New England, to be manufactured; but the decrease of manufactures in New England and their relative increase in the South surely foretold that at no very distant day the South will be recognized as the manufacturing region of the Union. In 1880 there were one hundred and eighty cotton-mills in the South; in 1885 there were nearly double that number. Those finer fabrics that require skilled labor of a high order will of course be the last to be manufactured in the South. It is the absence of skilled labor, and not climatic or other reasons, that accounts for the absence at present of mills for the manufacture of the finer fabrics. It was slavery that kept away manufactures from the South all these years. But when the

Southern white man was thrown upon his own resources, he went to work with brain and hand, and manufactures started at once.

Another new but most promising industry in the South is that of iron and coal mining. Ten years ago the iron mines of North Alabama could have been bought for fifty thousand dollars; to-day they could not be bought for fifty million. The city of Birmingham, Alabama, in the heart of the iron region, has come into existence in the last six years. It is thought that no city or district in the Union has such advantages for the manufacture of iron as this. Nor is Tennessee much behind Alabama in developing this new Southern industry. It has been found by trustworthy experiments that Pennsylvania, the great iron State of the Union, can no longer compete with these two States in the production of most kinds of iron. The mountain regions of Virginia, West Virginia, and North Carolina are perhaps as rich in natural resources, and only lack development. The manufacture of nails was begun in West Virginia after the war, and now several million dollars' worth of nails are manufactured annually in this one State alone. In the production of pig-iron, especially, the South excels. Comparing the statistics for 1880 with those for 1884, we find that in three Southern States—Virginia, Alabama, and Tennessee—there was an increase of over three hundred thousand tons, while all the rest of the United States shows a decrease of more than nine thousand tons. "That the South is destined to become the center of the iron interests of the United States is a fact that is daily becoming more apparent. The advantages of that section are not equaled elsewhere in America." So concludes Mr. R. H. Edmonds after a careful study of the subject. "The South," says Mr. Edward Atkinson, "has the imperial deposit of the iron and coal of the whole world."

It is the liberated white man that has set himself to developing the South and Southern industries. His brains and hands have gone to work, and they must find something to do. As long as slavery lasted the South was destined to be an exclusively agricultural region and the white race little more than overseers of the blacks. Nor did the white man, so long as slavery lasted, ever invite brains and capital from abroad to develop those industries which he himself either would not or could not develop. Slavery was exclusive. But the working white man of the emancipated New South is glad to have the stimulus and aid and competition of foreign brain and capital.

Two things are resulting from this change in the Southern white man and from the discovery of the wonderful adaptation of the South for manufactures: (1) Northern capital is turn-

ing rapidly and extensively to the South for investment; and while we think that the true secret of this wonderful development of new industries in the South is to be found in the fact that the white people, freed from the incubus of slavery, have set themselves to work in earnest, we yet recognize the fact that much of the capital with which this work is done has come from the North.

(2) The South formerly, being exclusively agricultural and having no manufacturing industries, strongly and almost universally favored free trade; while now, in view of its becoming a manufacturing district, public sentiment seems to be fast increasing in favor of protection, even as New England seems year by year to be growing more and more in favor of free trade, and this because, as some allege, it finds it easier to compete with the cheap labor of Europe than with the superior advantages of the South, where manufactures, if they can only be protected long enough to get a sure foothold, will prove dangerous if not fatal competitors of the manufacturing industries of New England. We hereby simply state the fact as to the change in Southern sentiment on this vexed subject, and give the common and perhaps true explanation of the change. It is, however, another question as to whether, from the standpoint of political economy, such Southerners be not acting against their own best interests, or at least against the interests of the Southern States at large, in advocating protection as against free trade.

The cotton-seed mill is another entirely new and most promising industry in the South. The utilization of the cotton-seed, formerly wasted, is now a very important element in the profit of cotton-growing. The chief profit of Northern industries consists in saving the waste, and this must ultimately be the profit of Southern industry likewise. Moreover, by the utilization of the cotton-seed an extremely valuable element has been added to the food supply of the world. At present about three and a half million tons of cotton-seed are produced annually. Every bale of cotton represents a thousand pounds of seed. In 1885 six hundred thousand tons of cotton-seed were crushed, the product averaging about twenty dollars per ton. In a few years all the cotton-seed will be thus utilized. A ton of cotton-seed produces forty gallons of oil, seven hundred and fifty pounds of oil-cake, and thirty pounds of lint. The various uses to which the cotton-seed oil is applied are well known. As an article of food it is said to contain ninety-five per cent. of nutriment. It is a common substitute for olive oil, and is said to be no mean substitute for cod-liver oil. One ton of

the cake, or meal after the oil has been extracted, is said to be worth three tons of seed for purposes of fertilizing. We have spoken more of this than of other industries because it is not only new in the South, but entirely new among the industries of the earth, and is strictly Southern in its origin and future development.

To show the marvelous development of new industries in the Southern States in the last five years, and to show the solid basis upon which the above statements rest, let us present and contrast the figures taken from the census of 1880 and those for 1885, collected with much care and with considerable labor at the late New Orleans Exposition.* The figures represent millions, and are in round numbers. They represent the value of the products, for the years named, in the Southern States.

	1880.	1885.	Increase.
Agricultural products.....	549	669	120
Manufacturing ".....	315	445	130
Stock and dairy ".....	130	168	38
Mining ".....	7	21	14
Total.....	1001	1303	302

Now quite half of this amount—and this is the important fact to be observed, even more than the increase—comes from industries that have sprung up in the South entirely since the war. How account for this? It is easy. The system of slavery kept out these industries before the war, but when the slaves were emancipated, the white people were set to work. They must do something; hence these new and rapidly increasing industries. There was not enough room in agriculture for all this addition to Southern labor. There are, perhaps, nearly twice as many workers in the South as before the war.

The wealth of the Southern States has increased forty-one per cent. in the last five years, while the population during the same period has increased only about sixteen per cent., which is an increase of wealth over population of twenty-five per cent., or five per cent. per annum for the entire population. And when we consider how very small a proportion of the colored people accumulate anything, it would probably not be an incorrect estimate to say that the Southern white people for the last five years, in addition to supporting themselves, have been adding about eight or nine per cent. per annum to their capital. This is a most creditable showing for the entire population considered in the aggregate—a far better showing than was ever made during any period of five years in the days of slavery.

It is not claimed that the above statistics are

* See the "Times-Democrat" (New Orleans) for September 1, 1885.

altogether accurate or altogether satisfactory; but if they be only approximately true, they serve the purpose for which they are introduced into this article, the design of which is not so much to show what the New South is as to show what the white man of the South has become,—viz., an earnest, progressive, public-spirited working-man.

Mr. Edward Atkinson of Boston has made careful study of the South and Southern industries since the war. His testimony is to the point. He says:

"To him who either hastily or with ample time now studies the condition of the Southern States, from the end of the war to the present time, nothing will appear more marvelous than the recuperative power of a people so lately made free from bondage as the people of the South; and the term 'made free' is used not only with respect to all the blacks, but to the vast majority of the whites as well. By comparison with other countries, the war left the Southern States with nothing but neglected lands, upon which were scattered dwellings more or less adequate to shelter the people, but with few mills or works of any kind, with old tools or none, and with all the internal machinery of commerce practically destroyed. The soldiers from most of the Southern States went back after the surrender to meet conditions absolutely unknown before; they were obliged to begin life anew without capital, without experience to guide them, and in the face of conditions which, from their point of view, must have been absolutely appalling. How it has been possible even for men of intelligence, but whose only training in the practical work of life had been gained in the destructive operations of war, to have returned to deserted and fenceless farms and plantations, there to adapt themselves to a complete change, not only in the system of labor, but to a complete revolution of the very ideas of the people in regard to labor, and in the few years that have since elapsed to have compassed the great progress already made, is one of the marvels the history of which has hardly yet been observed and is yet unwritten."

II. We consider next the subject of education and literature. There is at present an intellectual activity in the South quite unknown in *ante-bellum* times. By the emancipation of the slaves a most powerful impetus has been given to the intellect of the white man of the South, which is actively manifesting itself in a thirst for knowledge, in a widespread desire to promote popular education, and in contributions to the literature of the day, as seen in magazines, reviews, and books.

If there is one thing that takes precedence of all others in the South to-day it is popular education. That every one must have a common-school education is perhaps the distinctive American idea of this day; and no part of our country is doing more at present to carry out this idea than the South. The public or common schools now almost everywhere to be found in the South, it is well known, were started since the war. But they already bid fair at no distant day to banish the curse of

illiteracy from that region. Church and state, good and bad, rich and poor, high and low, white and black,—all seem united in promoting public education. Everybody must have at least a common-school education: this is the idea now up to which the South is working.

Indeed, by comparing statistics and consulting authorities, we discover that the South is doing more, in proportion to her abilities, for the cause of public education than any other part of the United States. This statement is confirmed by both Doctors Haygood and Mayo, than whom there are not two more trustworthy and competent authorities on this subject,—the one a Southern man who has traveled largely in the Northern States, the other a Northern man who has traveled extensively in the South. The Southern States are now giving to the cause of public education more than one-third of all the money raised by taxation, and Texas is giving more than one-half. The South is giving to this cause to-day more than twice as much as it gave to it five years ago, and five times as much as it gave in 1870. The South spent during 1885 more than seventeen million dollars for education; ten millions of it went to the public schools, which had an attendance of over three million pupils. Every year there is an increase of many thousands in the number attending the public schools. Let a single State serve as an index of the great advance made in the matter of public education in the South in the last few years. In 1869 North Carolina gave nothing to its public schools; in 1870 it gave \$43,000; in 1882, \$510,000; in 1885, \$850,000. "I doubt," says Doctor Mayo, "if the history of the world presents an instance of greater efforts, sacrifices, and expenditures for education under circumstances so discouraging as in the South during the period under consideration." It is thus seen that the white man of the South has been giving to the cause of education far more out of his poverty since the war than he ever gave out of his wealth in the days of slavery.

As to the character of the work done in these common schools as well as in many institutions of higher grade in the South, we cannot speak in terms altogether so encouraging. But considering all the circumstances it is as good as could be expected, and, what is better, improvement is being made year by year.

The educational institutions of the South lack organization into a system. As it is, the training or preparatory schools and the colleges and so-called universities are all rivals of one another, competing for the same students. The greatest evil is the want of good training-schools preparatory to the colleges and

higher institutions of learning. A few exist, such as Bingham's in North Carolina, McCabe's in Virginia, and the Webbs' in Tennessee, which are of the very best. But very few Southern colleges have any conditions of entrance; nearly all of them have preparatory departments, and hence students who should go to a preparatory school go at once to college. The better class of colleges in the South have just as high and rigid conditions of graduation as have institutions of the same grade in the North. The trouble is in their not having and rigidly adhering to proper conditions of entrance. As a result, preparatory schools cannot live in competition with the colleges attracting to themselves the untrained students, who are disposed to go at once to the highest institutions that will admit them, thinking thereby to save time, and not knowing that time lost in thorough training at a good preparatory school is time saved in the end. Preparatory classes at college cannot do the thorough training and drill work that can and will be done at good preparatory schools, chiefly because they have college methods of instruction which are quite different from those proper to the preparatory school. Another evil result of this unfair competition between schools that should be mutually correlated to and helpful of each other, is that it causes many institutions that are in reality only preparatory schools to call themselves colleges. They are compelled to do this in order to secure students. For these evils the colleges are most largely responsible, and from them alone can come the remedy. The evil here named is the greatest that confronts the cause of thorough and higher education in the South. A few of the better colleges, however, are already leading in the rectification of this evil by fixing and rigidly adhering to proper conditions of entrance. The public schools do not take the place of the academies or preparatory schools which they have helped to kill off, for they do not encourage their students to go to higher institutions of learning as the preparatory schools do. It is a most hopeful sign of the times that preparatory schools are being started all over the South.

Before the war the South had more sons in college than the North had. But the young men of the Old South, the sons of the Southern planters, went to school more because it was "the thing to do" than because they wanted to work or prepare earnestly for a life-profession. The ideal before young men now is very different from what it used to be in slavery times. Then it was the "Southern gentleman," which often meant, when brought to its secret and last analysis, the "gentleman idler" and

do-nothing. Now the ideal before young men is that of a worker. The effect of this change of ideal upon the character of the young manhood of the South cannot fail to show itself in making the Anglo-Saxon race in the Southern States a more robust, earnest, and manly type of character than was ever possible under the old civilization.

We next notice the subject of Southern literature. A Southerner who will take the trouble to look carefully and thoughtfully through a catalogue containing all the books written by American authors will make the painful discovery that about ninety per cent. of all the books of real value and of recognized ability have come from authors who lived north of Mason and Dixon's line. What is the answer to this discreditable fact? One word answers it — slavery. The curse of slavery with its slothful and enervating influences rested like an incubus on the intellect of the white man of the South, who in capacity for mental work is equal to any man of Anglo-Saxon blood and brains in America. Is it said, "No, not slavery, but climate explains this great difference between the intellectual activity and vigor of the North and South"? We reply, No, not climate, but slavery, and prove our assertion by pointing to the New South; for the most noticeable circumstance connected with our contemporaneous American literature at the present time, a circumstance recognized in the North quite as widely as in the South, is the fact that a very large number of those writers who are most popularly and prominently before the public at this time are Southern men and women. The number of prominent American writers who are from the South is, in fact, greater than that from the North in proportion to population. It would perhaps not overstate the truth to say that more real literary work has been done in the South in the last fifteen years than was done altogether before the war; though much of the fruit of this new spirit of intellectual activity, it is true, is yet to show itself. But it will appear in due time. The Southern intellect is at work as never before. The content with intellectual poverty is broken. Before the war if men wrote at all they wrote for pastime. Now they write as a vocation, and their writings bear as never before the solid marks of mental vigor and strong, manly work. In the matter of journalism the South has made great advances. The leading dailies of Atlanta, New Orleans, Nashville, Louisville, and other Southern cities could come only from the white man of the New South.

There appeared a year or two since in the New York "Independent" a series of articles on Southern literature by Maurice Thompson, who, though at present a resident of Indiana,

is a Southerner by training and former residence; and the fact that he is an author himself and most friendly to the South, gives additional weight and interest to what he writes on this subject. He has the right idea. He says:

"When I was a mere boy, I heard William Gilmore Simms say: 'No, sir, there never will be a literature worth the name in the Southern States so long as their aristocracy remains based on so many head of negroes and so many bales of cotton.' He expressed himself as strongly of the opinion that the institution of slavery was inimical to higher culture, and yet he seemed to believe slavery a righteous thing. He was really the representative Southern novelist of the old *régime*; and yet he struggled all his life for that which he had a right to receive but never got, the recognition of the low-country aristocracy. He was a strong instance of the hopelessness of the struggle of literature against the smothering limitations of slavery. It is not to be wondered at that such a state of society gave to literature and art nothing bearing the impress of genius. On the other hand, a freshening of the atmosphere will be found attending the works of the *post-bellum* writers; and it is pleasing to observe that the conservatism of the sort that so offended Simms has lost its control in the South. This change is not owing to any abandonment of Southern influences; for who is more deliciously warm and Southern than Cable and Harris? It means that the genius of the South has been liberated.

"New England and the South are the two unalterable and clearly limited sections of our country. For the rest, we are without any typical or characteristic American people. The West begins nowhere and ends nowhere, and can never be typified in literature or art any more than it can be geographically limited. Out of the West may come a genius, but out of the East and South must come the material for the truly American fiction and poetry. If literature and art take on a new power in the South, as now seems certain, we may expect to see in the results strong traces of the intellectual traits of the ancestry out of whom the Southern people have sprung, together with that perfect freedom of thought which has been made possible by the abolition of slavery and the breaking down of the old aristocracy. If Cable had been born forty years earlier he would have been, like the rest, under the shadow of slavery.

"Naturally enough it was the poets of the South who first began to shake their wings free of the hindrances of local prejudice and political limitations. We may scan in vain the whole list of Southern poets, living and dead, for one with strong, virile, original, hopeful genius, until we come to the name of Sidney Lanier, who began to write soon after the close of the war. He had in some way got his face set upon the future, and had cast off the fetters of conservatism and worship of the past."

The only explanation that can be given to this unprecedented intellectual activity in the South is found in the fact that the incubus of slavery has been lifted from the intellect and genius of the Southern white man. A new literary era, full of hope and promise, has, we believe, already begun to dawn upon this land that was so long beset with a civilization that gave no proper stimulus to intellect and no real incentive to genius. And the conclusion of all this is, that the intellect of the white man of the South has been emancipated, and,

rejoicing in its new, glad liberty, has gone actively and hopefully to work.

III. We might now show that this same law of newly infused life, activity, and development marks the New South in matters moral and religious as in the material and intellectual world. If ethical points admitted of proof by means of facts and figures as easily as do positions in other realms of argument, it would be a comparatively easy matter, we think, to show that the South is morally better than it was before the war. Society is better, the rich as a class are better, the masses of the people are better, are freer from public and private vices, take more interest in the Christian religion, contribute twice as much to all religious and benevolent objects, build neater and finer churches than they ever did in their wealth and prosperity in the best days of slavery. If the growth in numbers of the various denominations be any index of prosperity and activity, the white people of the New South are better than they were in the days of slavery. We might show how the war broke down the old church-aristocracy based on wealth and social distinctions, and reduced all the religious denominations of the South to very nearly the same social and financial level, and how, when the war was over, the churches which were composed most largely of the "common people" seemed to adapt themselves most readily to the new order of things, and have grown most rapidly in numbers, wealth, and influence since the war. We might show how

impossible it would have been before the war to fight successfully among the Southern planters, so many of whom were gentlemen of leisure and luxury, the great temperance battle, the victory of which is year by year being won slowly but surely in the South.* But it is not desirable to dwell here at any great length upon this phase of the subject.†

While, therefore, we recognize the fact that the Old South produced some statesmen as great and some characters as noble and true as any that have ever adorned, or will perhaps ever adorn, the annals of our American history, we yet believe that the true probation of the Anglo-Saxon race in the Southern States of the Union has in reality just now properly begun; and what they are to do remains now to be seen. But that which they have already done in this score of years since their true freedom properly began, gives promise that they will yet do a work to which America will point with pride. Southern millionaires there will yet be, and not a few, who will use their wealth, righteously gotten by their own honest labor, to develop their land and bless the race. The South will not always be a blank when American authorship is named. The white man of the South, in body, mind, and heart, has set himself to work in earnest; and on the grave of the Old South, aided now by colored freemen instead of slaves, he is building a New South that will be far grander than ever the Old South was or could have been.

Wilbur Fisk Tillett.

VANDERBILT UNIVERSITY, NASHVILLE, TENN.

* It may be noted that it was particularly observed in the late Atlanta election that the *educated* colored people voted with the whites for prohibition. It was the uneducated and illiterate negroes who were manipulated in the interests of the saloons.

† It gives us pleasure to see these views concerning the industrial, educational, and moral development of the South confirmed in a thoughtful and instructive volume by a watchful observer and recent traveler in the South. We refer to "The South," by Colonel A. K. McClure of Philadelphia.

DAKOTA.

SEA-LIKE in billowy distance, far away
The half-broke prairies stretch on every hand;
How wide the circuit of their summer day —
What measureless acres of primeval land,
Treeless and birdless, by no eyesight spanned!

Looking along the horizon's endless line
Man seems a pigmy in these realms of space;
No segment of our planet — so divine —
Turns up such beauty to the moon's fair face!
Here are soft grasses, flowers of tender hue,
Palimpsests of the old and coming race,
Vistas most wonderful, and vast and new;
And see — above — where giant lightnings play,
From what an arch the sun pours forth the day!

Joel Benton.

DIVINE HEALING, OR "FAITH CURE."

A STATEMENT.

Y way of explanation it may be said that the writer has been most intimately associated with the "faith-healing" movement ever since it first began to attract public attention in this country. Seven years

ago he was healed of a stubborn case of organic heart disease, after the best physicians and the most favorable climate and manner of life had alike signally failed to afford relief. At that time the literature concerning this subject was limited to two or three small books, besides such general works as Horace Bushnell's "Nature and the Supernatural"; but of late it has grown into a considerable library, experimental and theological. In the perusal of this mass of writing, and in the contributions which he has himself made to it, the writer has been necessarily placed in a position to speak with authority on the question, What is the doctrine and practice of Divine Healing, as presented by its most prominent advocates?

The object of this paper is to bring before the reader, as clearly as possible in such an exceedingly limited space, the real nature and ground for the doctrine that Jesus Christ has provided for believers the possibility of deliverance from the inward power of disease (as well as from sin), *provided* we meet all the Divine conditions.

THE AUTHORITY.

THE only authority to which any real recognition is accorded is found in the Bible. To the Word of our God we bow with absolute submission. What God says we propose to believe, whether we have been so fortunate as to prove it in our own experience or not. With Daniel Webster, we "believe religion to be not a matter of demonstration, but of faith. God requires us to give credit to the truths which he reveals, not because we can prove them, but because he declares them." Individual cases of healing, or phenomena, are absolutely worthless as to the question before us. All the cases in the world have nothing whatever to do directly with the doctrine of Divine Healing, for the very simple reason that they are not and never have been made the basis or ground of that doctrine. The only

foundation is the Word of God, and hence the examination of cases *per se* has no direct bearing upon the subject. But few men seek soul salvation, and some who appear to seek are not saved. It would be dangerous logic that discovered in this fact an error in the scheme of salvation.

THE DOCTRINE.

PASSING rapidly over the time when Abraham, Isaac, and Jacob each sought the Lord as the direct healer of physical diseases (see Genesis xx., xxv., xxx.), we come to the date of the Exodus, when God specially undertook the salvation of his people. Presumptive evidence is strongly in favor of the transmission of medical knowledge from the long-lived antediluvians, through Shem, who outlived Abraham, to the learned Egyptians of the time of Moses; but direct evidence is conclusive as to the advanced state of this knowledge. Clement of Alexandria (second century) mentions six hermetic books of Egyptian medicine, one of which was devoted to surgical instruments; and the learned George Ebers abundantly proves from ancient papyri that there were colleges of medicine, medical specialists, and much skill in surgery before the days of Moses. Herodotus also testifies upon this point. But "Moses was learned in all the wisdom of the Egyptians," hence he must have possessed the highest medical knowledge of this age. Notwithstanding all this, when the Exodus occurred God did not direct the people to go to Moses for treatment, but gave them, unasked, a clear and distinct promise of exemption from disease, on the condition of obedience. In Exodus xv. 26, we read, "If thou wilt diligently hearken to the voice of the Lord thy God, and wilt do that which is right in his sight, and wilt give ear to his commandments, and keep all his statutes, I will put none of these diseases upon thee which I have brought upon the Egyptians; for I am the Lord that healeth thee" (or, I am the Lord thy healer).

This promise was tested again and again. Moses prayed for leprosy (Numbers xii. 13), and Aaron for the plague (Numbers xvi. 47-48). The serpent's bite found its cure solely through faith (Numbers xxi. 9), and the pestilence vanished when David sacrificed (II. Samuel xxiv. 25). The Psalmist declares that when the children of Israel walked through the wilderness, "there was not one feeble

[sick] person among their tribes" (Psalms cv. 37); and Solomon reminded the people that there had not failed one word of all the promises given through Moses (I. Kings viii. 56).

In the fifth commandment we find the most explicit assurance of physical life, on the condition of obedience to parents. Passing on we read passages like the following, which cannot be disputed on any ground whatever; "O that there were such an heart in them, that they would fear me, and keep all my commandments always, that it might be well with them, and with their children forever" (Deuteronomy v. 29). "Ye shall walk in all the ways which the Lord your God hath commanded you, . . . that ye may prolong your days in the land which ye shall possess" (v. 33). "If thou shalt indeed obey his voice, and do all that I speak, . . . I will take sickness away from the midst of thee" (Exodus xxiii. 22, 25). "If ye hearken to these judgments, and keep and do them, . . . the Lord will take away from thee all sickness, and will put none of the evil diseases of Egypt, which thou knowest, upon thee; but will lay them upon all them that hate thee" (Deuteronomy vii. 12, 15. See also Leviticus xxvi. 15, 16, and Deuteronomy xxviii. 58-62). Beyond all possible controversy, exemption from disease was held out to the Jew.

David's understanding of this and his testimony upon the subject are both very clear. He says, "The Lord is the strength of my life" (Psalms xxvii. 1). "O Lord my God, I cried unto thee, and thou hast healed me" (xxx. 2). "O Lord, thou hast brought up my soul from the grave; thou hast kept me alive, that I should not go down to the pit" (xxx. 3). Out of a great many other utterances of the King of Israel, read especially Psalms xli. 3; xci. 1-6; ciii. 2-5. When Solomon dedicated the temple he made a distinct request for healing in answer to prayer, and the Lord distinctly promised to hear (see II. Chronicles vii. 13, 14). When David's child was sick, we read of a prophet, and not of a physician. Even the mighty sinner Jeroboam knew where to send when disease struck his child; and, later, the sternest rebuke and punishment were pronounced on Ahaziah because he forgot there was a God in Israel, and sent to inquire of Baalzebub.

There is no mistaking the lesson in the cases of Asa and Hezekiah. God had blessed and saved the former, but when "diseased in his feet . . . he sought not to the Lord, but to the physicians. And Asa slept with his fathers, and died" (II. Chronicles xvi. 12, 13). Two hundred years after this, Hezekiah prayed and was miraculously healed; God's instrument being once more a prophet and not a physi-

cian; and, in answer to the king's prayer, the people were also healed. But when Hezekiah neglected to tell the messengers of the King of Babylon what a wonderful deliverance God had sent him, the judgment of heaven fell upon him also (II. Chronicles xxxii. 31, and II. Kings xx. 12).

In the days of Hezekiah, Isaiah the prophet lived and wrote. In the great atonement chapter we find the forecast of the coming Messiah expressed in the following literal readings: "A man of pains, and acquainted with sickness" (v. 3). "Surely our sicknesses he hath borne, and our pains he hath carried them" (4). "And by his bruise there is healing to us" (5). "And Jehovah hath delighted to bruise him; he hath made him sick" (10).

The above is Dr. Robert Young's translation, made, of course, without the faintest idea of assisting modern "faith-healers." Dr. Isaac Leeser gives a significant rendering of the fourth verse: "But only our diseases did he bear himself, and our pains he carried." Now, in view of the facts developed above, what sort of mind would it have required in a Jew to say that this chapter only referred to spiritual blessings? But we have a sure and certain commentator on this point.

In Matthew viii. 16, 17, we find the distinct declaration that Jesus "healed all that were sick, that it might be fulfilled which was spoken by Esaias the prophet, saying, Himself took our infirmities, and bare our sicknesses." Here the Holy Ghost, through Matthew, says Isaiah spoke of the body; but in I. Peter ii. 24, we find the Spirit, speaking through that apostle, quoting these very words as applicable to the soul. The only inference must be that both are true, and that the atonement provided for both soul and body. *If Peter can be relied on for the present day, so can Matthew; and if Matthew's words have no present force and application, neither have Peter's.*

The Jew believes in a material kingdom; the Christian in a spiritual dominion. Both are right in what they receive, and wrong in what they reject. Jesus Christ did not abolish the decalogue and the moral law; the ceremonial alone passed away. We are not playing at see-saw with the Jew. Laws of health and healthy food are the same as they were in the days of Moses, and the best physicians are continually indorsing the sanitary and dietetic regulations of the great Hebrew leader.

Jesus Christ never turned away from those who sought healing at his hands. He specially commissioned the twelve to heal as well as to preach; and, later, the same commission was given to the seventy (Luke ix. 1-6, and x. 1-19). The only limit to these benefits was

unbelief, as is plainly declared in Mark vi. 5, and Luke iv. 27. His last words, according to Mark, contain a positive promise of the "signs" which should "follow them that believe," among which we find the healing of the sick through the laying on of hands. This was not a promise to the apostles, but to "them that believe." The apostles took up the work of healing as an important part of the gospel. "Such as I have give I thee," said Peter at the beautiful gate of the temple. In those days a man who, like Stephen, was full of the Holy Ghost and of faith almost of necessity did great signs and wonders among the people; and simple healings abounded everywhere. When the unbelievers raged against them, the apostles did not merely ask for more grace to bear it, but actually prayed for signs and wonders, in the name of Jesus (Acts iv. 30).

In Corinthians Paul speaks frequently of bodily matters, and specially mentions the several "gifts of the Spirit" which were then in the church. Now "gifts of healing" stand on precisely the same ground with the others. The church does not discard the "word of wisdom" or the "word of knowledge," nor throw away "governments"; indeed, she is well-nigh governed to death in these days. But if one has lapsed, why not all? In Ephesians i. 14, Paul speaks of the "earnest of our inheritance." Part of this inheritance is to have our mortal bodies quickened by his Spirit (Romans viii. 11). "He that hath the Son hath life," and it is therefore concluded that "Christ within you, the hope of glory," must or may give an earnest, or a foretaste, for the body as well as for the soul. An impartation of the Divine life is looked for, enabling the man to perform any and all God-directed work until the day of his death, if he dies before the second advent.

Finally, we have the unanswerable direction to the sick in James v. 14, 15. "Is any sick among you? [among you believers] let him call for the elders of the church; and let them pray over him, anointing him with oil in the name of the Lord: and the prayer of faith shall save the sick, and the Lord shall raise him up; and if he have committed sins [as a cause of the complaint] they shall be forgiven him." On this passage we remark that John Wesley quotes and indorses Bengel as saying that, "this was the whole process of physic in the Christian church, till it was lost through unbelief." Dr. Daniel Steele says that the man who attempts to represent the word "sick" as having any other meaning than bodily ailment, is "either an ignoramus in Greek or an intentional deceiver"; and Dean Alford most forcibly declares that the whole

passage refers to physical disorders and to these only.

As to the knowledge of medicine in the time of Christ, there is abundant evidence to show that it was extensive and profound. Following Hippocrates (B. C. 460), who mentions no fewer than two hundred and sixty-five drugs, besides many dietary and surgical remedies, arose the schools of medicine under Herophilus, a profound anatomist, and Erasistratus his rival. (Doctors disagreed in those days as well as at present.) After these came the Empiric school (280 B. C.), whose physicians were very successful, especially in surgery and the use of drugs; and later on Asclepiades, the friend of Cicero, founded a system known as "Methodism." The medical knowledge of the Roman Empire came from these men. This is sufficient to show that healing by faith was not instituted because of the ignorance of scientific methods.

One point needs to be especially guarded. Death is a consequence of sin, and is included in "the curse of the law." But "Christ hath redeemed us from the curse of the law" (Galatians iii. 13), and a logical conclusion would lead us to expect translation, were it not for a number of special scriptures which expressly declare that this is not included at present (see, Hebrews ix. 27, 28; Romans viii. 10-22; I. Corinthians xv. 23-32; Colossians iii. 4; Hebrews ii. 8). These texts withhold the boon of translation from the direct covenant, and retain it in the special providence of God, except for the living, waiting saints at the second advent. They have its sure promise.

"Jesus Christ, the same, yesterday, to-day, and forever," is a tremendous declaration. Now we have seen that the promises of God most undeniably contain the assurance of physical health, on condition of obedience. These promises have not been outlawed by time. We cannot throw them away without sacrificing the decalogue and the moral law. An unbroken line of leaders, kings, and prophets carry them down to the present gospel dispensation, and they are ours to-day. In II. Corinthians i. 20, we read, "For all the promises of God in him are yea, and in him Amen, unto the glory of God by us." These are included in the "all," therefore they are yea and amen in Christ, and therefore are based upon his vicarious atonement. The conditions to-day are the same as of old. *We must believe, and obey.* Belief is faith, and obedience is works. "Faith without works is dead"; so belief and simple obedience cannot be separated. When Naaman joined his obedience to his belief, and dipped in Jordan, faith and works were united, and salvation resulted. It is ever so.

THE PRACTICE.

1. "FAITH-HEALERS" believe in the use of means. The Scriptural means are always employed: — (1) Laying-on of hands, (2) anointing with oil, (3) the prayer of faith. They also believe in occasional leadings of the Spirit to employ other means, which may be inherently efficacious or not.

2. No one is advised by any prominent leader or teacher to lay aside all medicines, unless he can do so with perfect spontaneity. Forced abstinence is will power, not faith.

3. Faith in the patient is regarded as necessary when the individual is responsible. Even the man "borne of four" and let down through the roof had to obey the command to rise. Rare exceptions are known where the individuals have not been aware of the prayer offered in their behalf. These can be included under general answers to prayer. They are certainly conclusively against the supposition of any subjective condition of the patient.

4. A perfect consecration of the whole spirit, soul and body, is strongly urged. It would be almost blasphemous to ask for healing with any other view than the entire devotement to God of the renewed powers. Hence the universal experience of spiritual blessings in those who seek to be healed.

5. Inquirers are instructed to believe that they do receive, when the spirit witnesses within that their consecration and obedience are complete, and the prayer has been offered. "What things soever ye desire when ye pray, believe that ye receive them, and ye shall have them," is the warrant for acting out the belief; that is, acting as if you were well. The leaders in this movement have themselves received life and health while following this same plan of action, and therefore give this advice with all knowledge and honesty.

6. The laying-on of hands, prayer, and anointing are distinctly taught to be of no efficacy in themselves, any more than Jordan was to Naaman. But it is held that "to obey is better than sacrifice."

7. Those who fail to get saved, and those who fail to be healed, afford no argument against the continuance of preaching or praying. Lists of failures are not kept in either case; and the real reason lies in the fact presented in the very beginning of this article, that the doctrines of Christianity are not

founded on phenomena, but upon the word of God alone.

8. All who weigh the meaning of words counsel the use of such terms as will be mutually intelligible. A man who is exercising faith, but whose symptoms continue, is advised to say, I believe, and not, I feel.

9. It is taught that Satan can tempt to sickness, precisely as he can tempt to inward sin, by producing a symptom. He can consistently advise the use of a medicine to one who is striving to fix his faith upon God alone; especially when he thinks that the remedy will prove unavailing. In any case such action is more consistent in him than that of those good people who profess to believe that it is the will of God for them to suffer, and at the same time spend time and wealth, for every conceivable medicine, in the attempt to defeat that will by getting well.

10. Finally, it is distinctly taught that Divine Healing, like every branch of salvation, is a matter of personal experience; and as such is not susceptible of perfectly logical explanation to the unbeliever. To him all such things are "foolishness," but "to us who believe" they become "the power of God." Every saved or healed man can testify from his heart: "One thing I know, that whereas I was blind, now I see," though he may utterly fail to convince the Scribes and Pharisees.

True or false, there is no belief rising more swiftly before the churches everywhere than that of Divine Healing. There are over thirty "faith homes" in America to-day. In England, and on the continent of Europe, can be found a large number, some of them commodious institutions with a history of many decades of years. In June, 1885, an international conference on this subject assembled in London, composed of delegates from all parts of the world; and the great Agricultural Hall was taxed to its utmost to accommodate the serious crowds that flocked to hear. During the last two seasons a number of conventions have been held in New York, Brooklyn, Philadelphia, Baltimore, Pittsburg, Detroit, and elsewhere, in all of which Divine Healing has claimed an important part. The mass of evidence offered, the multitude of witnesses arising, and the words of Scripture on the subject, demand at least a respectful hearing, and invite the closest scrutiny into the doctrine and practice of Divine Healing.

R. Kelso Carter.

FAITH-HEALING AND KINDRED PHENOMENA.

(SUPPLEMENTARY ARTICLE.)

UNDER this same title in THE CENTURY for June, 1886, I presented some of the results of many years' investigation of this subject, by raising and answering these questions: "What are the facts, and how may

they be explained?" The conclusion reached was that the claims of the Christian faith-healers—technically so called—to supernatural powers are discredited by the facts that they exhibit no supremacy over Pagans, Spiritualists, Mormons, magnetic healers, etc; that they cannot parallel the works of Christ and of the apostles; and that all they really accomplish can be accounted for by natural causes. The article gave rise to much public discussion and private correspondence, but no statement of fact has been disproved and no induction invalidated.

DEFENSE OF FAITH-HEALERS EXAMINED.

CONFIDENT assertions of supernatural powers, and vehement denials of the sufficiency of natural causes to account for their results, and the quotation of misapplied passages of Scripture, have been the only defensive weapons of the faith-healers. They have, however, been compelled to avow that "they keep no record of failures, as they do not depend upon phenomena or cases, but upon the divine Word."

This admission is fatal. If they cannot do the works, either they have not the faith, or they misunderstand the promises they quote. Christ and the apostles depended upon the phenomena to sustain their claims; and when the apostles failed in a single instance Christ called them a faithless and perverse generation. The failure of these religious thaumaturgists to surpass other manipulators in the same line in the nature and extent of their mighty works has compelled them to say that they do not depend upon phenomena, and make no record of unsuccessful attempts and relapses.

* Brainerd, in his narrative of his work among the American Indians, confesses his great embarrassment as follows:

"When I have instructed them respecting the miracles wrought by Christ in healing the sick, etc., and mentioned them as evidences of his divine mission, and of the truth of his doctrines, they have quickly referred to the wonders of that kind which [a diviner]

The difficulty is that they apply promises which relate to the power of working miracles to the ordinary Christian life. That they misunderstand and misapply them is clear also from the fact that the most spiritually minded Christians in the greatest emergencies have been unable to work miracles. The reformers—Calvin, Knox, Luther, etc.—could not. John Wesley, in his letter to the Bishop of Gloucester, enumerates all the miraculous gifts possessed by the apostles, and expressly denies that he lays claim to any of them. Judson, Carey, Martyn, Duff, Brainerd,* and other eminent missionaries trying to preach the Gospel among Pagans, Mohammedans, and Pantheists, most of whose priests are believed by the people to be able to work miracles, were unable to prove their commission by any special power over disease, or by other mighty works. In Algiers, after its conquest by the French, the power of juggling priests was still so great that it was impossible to preserve order until Robert Houdin, the magician, was sent over, whose power so far surpassed that of the priests that their ascendancy over the people was broken.

When any Christian presses the faith-healers with these points, they turn upon him and declare that he "does not believe in answer to prayer;" to which the reply is, that a belief that God may, and sometimes does, restore health in answer to prayer in connection with the use of means medical, hygienic, or surgical, without any visible interference with the laws of cause and effect which he has made, is very different from holding that instantly, at the touch of a hand, the repetition of a phrase, the application of a drop of oil, a glance at a sacred relic, the touch of the hand of a dead ecclesiastic, or the drinking of a glass of water from a miraculous spring, he exercises his power and cures disease without the use of other means.

The charge that the writer is not a spiritually minded man was to be expected: this is the common cry of the superstitious when their errors are exposed. But the most extraordi-

had performed by his magic charms, whence they had a high opinion of him and of his superstitious notions, which seemed to be a fatal obstruction to some of them in the way of their receiving the Gospel."

Yet, though Brainerd could do none of these mighty works, he was the means of the conversion of that very diviner by the influence of his own life and the spiritual truths which he taught.

nary allegation was made by the Rev. A. B. Simpson, of the city of New York. He states his belief that the cases "of healing and other supernatural phenomena ascribed to Spiritualism cannot be explained away either as tricks of clever performers or the mere effects of will power, but are, in very many instances, directly supernatural and superhuman"; and then says: "The cures to which Dr. Buckley refers among heathen nations, the Voodoos of the negroes, and the Indian medicine men, are all of the same character as Spiritualism." On the subject of Roman Catholic miracles he says:

"Where there is a simple and genuine faith in a Romanist,—and we have found it in some,—God will honor it as well as in a Protestant. . . . But when, on the other hand, they are corrupted by the errors of their Church, and exercising faith, not in God, but in the relics of superstition, or the image of the Virgin, we see no difference between the Romanist and the Spiritualist, and we should not wonder at all if the devil should be permitted to work his lying wonders for them, as he does for the superstitious Pagan or the possessed medium."

This means that if the Roman Catholics are devout, it is God who does the mighty works for them; if superstitious, it is the devil. As many of the most remarkable phenomena connected with Roman Catholicism have occurred where the Virgin is most prominent, as at the Grotto of Lourdes, and at Knock Chapel (a girl having been cured recently by drinking water with which some of the mortar of the chapel had been mingled), it is pertinent to ask, if supernatural operations are involved in both, whether the works of God might not be expected to be superior to those of the devil?

Mr. Simpson proceeds to impute to the writer an unconscious league with the devil. Referring to some of the phenomena attested as having occurred under my superintendence, Mr. Simpson says: "We believe the devil will surely possess every heart that is not constantly yielded to God, and we should not be at all surprised if Dr. Buckley on that occasion was actually, without the slightest intention on his part, assisting at a real spiritualistic *séance* conducted by the devil in the background." Here the Spiritualists and the faith-healers unite as to the supernatural origin of these phenomena, the Spiritualists declaring that there is a subtle force behind these things which they call the spirits of the departed, Mr. Simpson affirming that that force is the devil. He then says: "Those who have been used as mediums always lose their power when they become Christians, and the writer [Simpson] has had them come to have the devil cast out of them."

It is not wonderful that these manifestations

should excite suspicions of supernatural agencies in minds not accustomed to the phenomena or to close observation. About seventeen years ago, at the request of a committee, I lectured in a church in Simsbury, Connecticut. In the presence of a large audience some remarkable things occurred. Among others a young artist who was visiting in the place passed into the state of trance. I whispered in his ear, "You are a temperance lecturer; the audience is waiting to hear you"; and he who had never spoken in public in his life delivered quite an eloquent address. Then it was suggested, "You are defending a young man on trial for murder, and the judge has just ordered you to proceed." For fifteen minutes he spoke eloquently, more so than most lawyers. Then he was asked to cast his eyes upward and describe what he could see. He instantly began such a rhapsodical description of the heavenly world as to produce a thrilling effect upon the assembly. A gentleman with a reverent aspect said, "Are you quite sure that this is not of the devil or supernatural?" The young man had described certain thrones and figures seated thereon. I asked him what little animal that was which was coming out from under one of those seats. He immediately began running to and fro in front of the audience crying "Kitty! Kitty! Kitty!" The assembly was at once convinced of the natural origin of the phenomena. He was simply dreaming upon all these subjects.

As the object of the lecture was to destroy belief in the superhuman origin of Spiritualism, it is in order, if Mr. Simpson's theory be true, to inquire precisely what point the devil thought he was gaining when he assisted at that performance.

Mr. Simpson goes so far as to say that what he calls "divine healing" is "a great practical, Scriptural, and uniform principle, which does not content itself with a few incidental cases for psychological diversion or illustration, but meets the tens of thousands of God's suffering children with a simple practical remedy which all may take and claim if they will." Such propositions as this are as wild as the weather predictions that terrify the ignorant and superstitious, but are the amusement and scorn of all rational and educated persons; as the following, from the "Congregationalist" of Boston, shows:

"We have taken pains, before publishing it, to confirm, by correspondence, the singular case of a woman's death in a religious meeting at Peekskill, N. Y. Rev. Mr. Simpson, formerly a Presbyterian preacher, was holding a Holiness Convention, Major Cole, the 'Michigan Evangelist,' being a helper. In an 'anointing service' an elderly lady, long afflicted with heart disease, who had walked a long way after a hard day's work, presented herself for 'divine heal-

ing,' and was anointed by Mr. Simpson. A few minutes after, she fainted and died, the finding of the jury of inquest being that her death was from heart disease, but hastened by the excitement of the service. One would suppose that the case would be a warning against the danger of such experiments, if not a rebuke of the almost blasphemous assumption of miraculous power."

ERROR IN MENTAL PHYSIOLOGY.

A RADICAL error in mental physiology which most of these persons hold relates to the will. Referring to the theory which explains the cure of many diseases by bringing the person to exercise special will power, Mr. Simpson says:

"Why is it that our physicians and philanthropists cannot get the sick to rise up and exercise this will power? Oh! that is the trouble to which we have already adverted. The will is as weak as the frame, and the power that is needed to energize both is God; and Faith is just another name for the new divine WILL which God breathes into the paralyzed mind, enabling it to call upon the enfeebled body to claim the same divine power for its healing. We are quite willing to admit the blessed effect of a quickened faith and hope and will upon the body of the sick. This is not all. There must also be a direct physical touch."

The reader of the former article will recall the cure performed by the late Dr. Krakowitzer, who said to the young woman, "Get out of bed, put on your clothes, and go downstairs and meet your mother in the parlor." Her voluntary will power was inadequate to the effort, but the concentration of her mind by an extraordinary stimulus, a command from a stronger will than her own, developed latent strength.

A hotel-keeper in New Hampshire, lingering at the point of death, as was supposed, for weeks with typhus, saw the flames burst from his barn. "Great God!" cried he, "there is nobody to let the cattle out!" He sprang from the bed, cared for the cattle, broke out in a profuse perspiration, and recovered. The burning barn gave him no strength, but the excitement developed latent energy and will.

Mrs. H., whom I often visited, had long been ill, was reduced almost to a skeleton, and could not raise a glass of water to her lips. One day the house got on fire. She sprang from the bed, seized a chest full of odds and ends, and carried it out-of-doors. This chest, as a result of an effort of the will, she could not have moved without help when in health.

A letter recently received from the Rev. J. L. Humphrey, for many years a missionary in India, now of Richfield Springs, N. Y., says:

"The following instance came under my observation in India. An officer of the Government was compelled to send native messengers out into a district infected with cholera. As he sent them out they took the disease and died; and it came to such a pass among the Government peons under his charge that a man thought himself doomed when selected for that duty.

A German doctor in that region had put forth the theory that inoculation with a preparation of quassia was a specific for cholera—a simon-pure humbug. But this gentleman seized the idea; he cut the skin of the messenger's arm with a lancet so as to draw some blood, and then rubbed in the quassia, telling them what the doctor had said about it. Not a man thus treated died."

The surprising strength and endurance exhibited by lunatics and delirious persons constantly show that the amount of power which can be commanded by the will under an ordinary stimulant is by no means so great as the latent. Equally true is it that mental and emotional excitement often renders the subject of it unconscious of pain, which would otherwise be unendurable. Even without any such experience, a sudden shock may cause a disease to disappear.

The following was narrated to me by an eminent physician:

"I was once called to see a lady, not a regular patient of mine, who had suffered for months with rheumatism. Her situation was desperate, and everything had been done that I could think of except to give her a vapor bath. There was no suitable apparatus, and I was obliged to extemporize it. Finding some old tin pipe, I attached it to the spout of the tea-kettle and then put the other end of the pipe under the bed-clothes, and directed the servant to half fill the kettle, so as to leave room for the vapor to generate and pass through the pipe into the bed. I then sat down to read, and waited for the result. The servant girl, however, desiring to do all she could for her mistress, had filled the kettle to the very lid. Of course there was no room for steam to form, and the hot water—boiling, in fact—ran through the pipe and reached the body of the patient. The instant it struck her she gave a shriek and said, 'Doctor, you have scalded me!' and as she said this she leaped out of bed. But now," said the physician, "came the wonder. The rheumatism was all gone in that instant, nor did she have any return of it, to my knowledge."

A "MISSING LINK."

IF there were no other, a fatal stumbling-block in the way of the faith-healers is their failure in surgical cases. They have caught up everything that could even point at supernatural interference with the order of nature. The following case is taken from the "Provincial Medical Journal" of Leicester and London, June 1, 1886, and is an illustration of the subject:

"Another 'wonderful cure' at the Bethshan. T. M. N., during a voyage from Liverpool to New York on board the steamship *Helvetia*, sustained a compound fracture of the left humerus at about the line of junction of the middle with the lower third. The injury was treated for a few days by the mercantile surgeon. On his arrival at New York on December 29, 1883 (four days after the accident), he was transferred to a public hospital. He was at once treated, the fracture being fixed in a plaster-of-Paris dressing, and this mode of mechanical fixation was continued for three months, when the surgeon, perceiving no progress toward union, performed the operation of resetting the fractured

ends. The arm and forearm were again put in plaster-of-Paris, and retained until his arrival in Liverpool, five months after the date of the injury. On June 10, 1884, he submitted his arm for my inspection, when on removal of the dressing I found there was no attempt at repair, and that the cutaneous wound pertaining to the operation had not healed. The method of treatment I pursued was the following: The forearm was first slung from the neck by its wrist; the ulcer was attended to, and an area inclusive of the fracture partially strangulated by means of india-rubber bands. This was continued for three months, but without appreciable result. I therefore, in addition to this treatment, percussed the site of fracture every three weeks. Four months passed, and yet no change. After seven months the ulceration was healed, and the limb slung as before, partially strangulated and percussed monthly, but, in addition, maintained well fixed by a splint, and carefully readjusted on the occasion when percussion was employed. At length I found evidence that repair was progressing, for at this date, December, 1885, it required some force to spring the connection. I now knew it could only be a question of a few weeks for consolidation to be complete, but thought it wise for some little time to leave the arm protected, lest rough usage should destroy the good attained. However, the patient suddenly disappeared, and on the 13th of April I received the following interesting document:

“‘No. 2 WOODHOUSE ST., Walton Road,
Monday, April 12th.

“‘DEAR SIR: I trust after a very careful perusal of the few following words I may retain the same share of your favorable esteem as previously, and that you will not think too hardly of me because, although I have done a deed which you would not sanction, and which was against your injunctions. Still, I must write and let you know all about it, because I know you have been so kind to me from a purely disinterested motive. I dare say you remember me mentioning the “faith-healing” some time ago, and to which you remarked that “it would do no harm to try it, but that you thought I should require *mighty* faith.”

“‘Well, I have tried it, and I am sure that you will be glad to hear that my arm is not only in my sleeve, but in actual use, and has been for the past three weeks. The pain I bore after the last beating was something dreadful, and being in great trouble at my lodgings at the time, I was downhearted. I was thrown out of my lodgings, and being quite destitute, I reasoned in myself, and came to the conclusion that if I really asked God to make it better right away he would, and I was told that if I would do away with all means and leave it to him, it would be all right. So I just took off all your bandages and splint, and put it in my sleeve. I have now the use of my arm, and it is just the same as my right one—just as strong. Several times I called at your house when on my way to the Bethshan, George’s street, but Dr. Gormley slammed me out, and therefore I did not like to come again.

“‘I cannot describe how thankful I am, doctor, for your past kindness and goodness to me, and that is one reason I have not seen you. I know you will be glad to see me with it in my sleeve.

“‘Yours very truly,

“‘TOM M. NICHOLSON.

“‘DR. H. O. THOMAS.

“‘P. S. — Any communication will reach me if addressed to me at the above, *should you desire to write.*”

“There is very little to add to this case. . . . It affords, however, a typical instance of the way a Bethshan thrives. The surgeon tells a patient all but recovered to be cautious lest the results of months of care be nullified, and ‘fools rush in’ and tell him ‘to dispense with means and all will be well.’ In this particular instance the result was harmless, but it would

be interesting to inquire how many poor deluded victims are consigned to irremediable defects by an ignorant and fanatical display which is a satire upon our civilization.”

In this country the case that has been the most frequently used is narrated by the late W. E. Boardman, who says the story was told him by Dr. Cullis, and gives it thus:

“The children were jumping off from a bench, and my little son fell and *broke both bones of his arm below the elbow.* My brother, who is a professor of surgery in the college at Chicago, was here on a visit. I asked him to set and dress the arm. He did so; put it in splints, bandages, and in a sling. The dear child was very patient, and went about without a murmur all that day. The next morning he came to me and said, ‘Dear papa, please take off these things.’ ‘Oh, no, my son; you will have to wear these five or six weeks before it will be well!’ ‘Why, papa, it is well.’ ‘Oh, no, my dear child; that is impossible!’ ‘Why, papa, you believe in prayer, don’t you?’ ‘You know I do, my son.’ ‘Well, last night when I went to bed, it hurt me very bad, and I asked Jesus to make it well.’ I did not like to say a word to chill his faith. A happy thought came. I said, ‘My dear child, your uncle put the things on, and if they are taken off, he must do it.’ Away he went to his uncle, who told him he would have to go as he was six or seven weeks, and must be very patient; and when the little fellow told him that Jesus had made him well, he said, ‘Pooh! pooh! nonsense!’ and sent him away. The next morning the poor boy came to me and pleaded with so much sincerity and confidence, that I more than half believed, and went to my brother and said, ‘Had you not better undo his arm and let him see for himself? Then he will be satisfied. If you do not, I fear, though he is very obedient, he may be tempted to undo it himself, and then it may be worse for him.’ My brother yielded, took off the bandages and the splints, and exclaimed, ‘It is well, absolutely well!’ and hastened to the door to keep from fainting.”

Afterward the Rev. Mr. Gordon introduced the above alleged occurrence into his “Mystery of Healing.”

This case was thoroughly investigated by Dr. James Henry Lloyd, of the University of Pennsylvania, and in the “Medical Record” for March 27, 1886, Dr. Lloyd published a letter from the *very child*, who is grown up and become a physician.

“DEAR SIR: The case you cite, when robbed of all its sensational surroundings, is as follows: The child was a spoiled youngster who would have his own way; and when he had a *green stick* fracture of the forearm, and, after having had it bandaged for several days, concluded he would much prefer going without a splint, to please the spoiled child the splint was removed, and the arm carefully adjusted in a sling. As a matter of course, the bone soon united, as is customary in children, and being only partially broken, of course all the sooner. This is the miracle.

“Some nurse or crank or religious enthusiast, ignorant of matters physiological and histological, evidently started the story, and unfortunately my name—for I am the party—is being circulated in circles of faith-curites, and is given the sort of notoriety I do not crave. . . .

“Very respectfully yours,

“CARL H. REED.”

THE EVILS OF THIS SUPERSTITION.

MANY well-attested cases of irreparable damage to religion, individuals, and to the peace of churches and families have been placed in my hands or ascertained by investigation, both before and since the publication of my former article. From them I select the following:

"A lady, a member of the Christian church, aged about fifty-five years, had been ailing for two or three years. She fell and bruised her side, and was confined to her bed for some weeks. She was better for a month perhaps, and then the disease developed into internal abscess of the stomach, and she slowly declined until her death, which occurred about five months afterwards. She and her family became very anxious for her recovery, and, being very devout, their minds turned to faith-cures and faith-healers. A month before her death she was in correspondence with one of these persons. This lady appointed an hour in which to pray, and directed that friends in the place where she resided should meet and pray at that time. Her pastor went and prayed. At the close of this interview the patient told him she had received just then a great blessing, so that now she felt reconciled to die, and subsequently said nothing about healing, but much about the heavenly rest which she expected soon to enter. For a long time her nourishment had been, and then was, taken entirely in the form of injections of beef tea. On a certain day a layman who had been healed, and was himself a healer and a prime mover in faith-healing conventions, visited her about noon and staid until near evening. He told the lady and her children that the Lord had sent him there that she might be instantly healed, read and expounded the book of James, brought out his phial of oil, anointed her forehead, knelt by her bedside, holding her hand in his, and prayed very earnestly for her immediate cure, claiming present conscious testimony by the Holy Spirit that the cure was wrought. On rising from his knees, still holding her hand, he lifted the lady in bed to a sitting posture, and pronounced her cured in the name of the Holy Trinity. A member of the family protested that it was hazardous for her to sit up in that way, as she had not been able to sit up for many weeks. Finally the patient laid down exhausted, and the visitor left, assuring the family that 'in four days mother would be up and about.' Shortly after this (perhaps an hour) intense pain in the stomach began and kept increasing until the agony became unendurable, so that groans and screams of distress were wrung from her. This continued for twelve hours, when exhaustion and stupor ensued, which lasted until her death, the next day. An autopsy was held by physicians who had been in attendance, and they reported a lesion of the stomach, caused, in their opinion, by the exertion of the patient in arising and sitting up in bed. When our informant met the visiting brother who had had a revelation of the Spirit that the patient was to recover, he inquired after the case, and on being told that our informant was about to go to the funeral, he expressed great surprise and said, 'It sometimes happens that way.'"

Can anything more blasphemous be imagined than the presumptuous claim of a revelation of the Holy Spirit to a matter of fact, and the pronouncing the dying cured in the name of the Holy Trinity?

Families have been broken up by the doctrine taught in some of the leading faith-homes that friends who do not believe this

truth are to be separated from because of the weakening effect of their disbelief upon faith, and a most heartrending letter has reached me from a gentleman whose mother and sister are now residing in a faith-institution not far from this city, refusing all intercourse with their friends, and neglecting the most obvious duties of life.

Certain advocates of faith-healing and faith-homes have influenced women to leave their husbands and parents and reside in the homes, and have persuaded them to give thousands of dollars for their purposes, on the ground that "the Lord had need of the money."

This system is connected with every other superstition. The Bible is used as a book of magic. Many open it at random, expecting to be guided by the first passage that they see, as Peter was told to open the mouth of the first fish that came up and he would find in it a piece of money. A missionary of high standing with whom I am acquainted was cured of this form of superstition by consulting the Bible on an important matter of Christian duty, and the passage that met his gaze was, "Hell from beneath is moved to meet thee at thy coming." Paganism can produce nothing more superstitious than this, though many other Christians, instead of "searching the Scriptures," still try to use the Bible like a divining rod.

It feeds upon impressions, makes great use of dreams and signs and statements foreign to truth and pernicious in their influence. A young lady long ill was visited by a minister who prayed with her, and in great joy arose from his knees and said, "Jennie, you are sure to recover. Dismiss all fear. *The Lord has revealed it to me.*" Soon after, physicians in consultation decided that she had cancer of the stomach, of which she subsequently died. The person who had received the impression that she would recover, when met by the pastor of the family, said, "Jennie will certainly get well. The Lord will raise her up. He has revealed it to me." "Well," said the minister, "she has not the nervous disease she had some years ago. The physicians have decided that she has cancer of the stomach." "Oh, well," was the reply, "if that is the case, she is sure to die."

A family living in the city of St. Louis had a daughter who was very ill. The members of this family were well acquainted with one of the leading advocates of faith-healing in the East, who made her case a subject of prayer, and wrote her a letter declaring that she would certainly be cured, and the Lord had revealed it to him. The letter arrived in St. Louis one day after her death.

These are cases taken not from the operations of recognized fanatics, but from those of leading lights in this *ignis fatuus* movement.

It is a means of obtaining money under false pretenses. Some who promulgate these views are honest, but underneath their proceedings runs a subtle sophistry. They establish institutions which they call faith-homes, declaring that they are supported entirely by faith, and that they use no means to make their work known or to persuade persons to contribute. Meanwhile they advertise their work and institutions in every possible way, publishing reports in which, though in many instances wanting in business accuracy, they exhibit the most cunning wisdom of the children of this world in the conspicuous publication of letters such as the following:

"DEAR BROTHER: The Lord told me to send you fifty dollars for your glorious work. I did so, and have been a great deal happier than I ever was before; and from unexpected quarters *more than three times the amount has come in.*"

In one of the papers devoted to this subject this letter recently appeared:

"DEAR BROTHER: Please announce through the 'Crown of Glory' that I will sail for the western coast of Africa to preach a full salvation in the name of the Lord Jesus Christ, and to heal whomsoever the Lord will by faith, as soon as the Lord sends the balance of the money to pay my fare. I have denounced all rum, wine, cider, tobacco, beer, ale, and medicines—only Jesus! Only Jesus my Savior! I will sail October 10, if the Lord sends the balance of the money to Brother Heller, 48 Orchard st., Newark, N. J.

"Yours, in Christ,

"S. B. MYLER."

A prominent English advocate of this method of raising money, who, it must be confessed, has done a most extraordinary and useful work, on one of his missionary tours in this country explained his curious system with so much eloquence that the founders of certain faith-homes in the United States called upon the editors of various religious papers and endeavored to induce them to set forth that there are institutions in this country conducted on the same principle, naïvely observing that they did not wish his presence and eloquence to divert to England money that should be expended here. Yet they "do not use means"! The whole system is a use of the shrewdest kind of means. But as in the case of the supposed faith-healings, for every successful instance there are a large number of unrecorded grievous failures; and many subjects of delusion who have established faith-homes to which the public has not responded have suffered the agonies of death. Some have starved, others have been relieved by benevolent Christian friends, and still others have been taken to asylums for the insane. Similar wrecks are to be found all through the land, dazzled and de-

ceived by the careers of a few persons who have succeeded in getting their enterprises under way and enjoy a monopoly of their limited method of obtaining revenues. Some of those who succeed are doubtless as sincere men and women as ever lived. Others oscillate between knavery and unbridled fanaticism.

The horrible mixture of superstition and blasphemy to which these views frequently lead is not known to all persons. I quote from a paper published in Newark, N. J., in the interest of faith-healing:

"DEATH.—Three of the richest men in Ocean Park, N. J., have died. Faith-healing has been taught in the place, but was rejected by them, so death came."

"CHARLESTON, S. C.—A few years ago the Holy Ghost sent me to preach in that city. But they rejected the Gospel and me. A wicked man shot at me and tried to kill me, but God saved me so that I was not harmed. . . . But I had to leave Charleston and do as the great Head of the Church said: . . . 'when ye depart out of that house or city, shake off the dust from your feet.' Earthquake, September 1, 1886; one-half the city in ruins. It has a population of about fifty thousand people. Ye wicked cities in the world, take warning! God lives!"

SUPPOSED DIFFICULTIES.

It has been suggested that if faith-healing, as I have claimed, can be demonstrated to be subjective, what is called conversion can be accounted for in the same way. If by conversion is meant the cataleptic condition which occurred among the Congregationalists in the time of Jonathan Edwards, certain Presbyterians and Baptists in the early part of this century in the South and West, and the early Methodists, and is still common among the colored people, the Second Adventists, and the Salvation Army, and not wholly unknown among others, I admit that such phenomena are of natural origin.

But if conversion is understood to mean a recognition of sinfulness, genuine repentance, and complete trust in the promises of God, accompanied by a controlling determination to live hereafter in obedience to the law of God, this is a radically different thing. Such an experience may be sufficiently intense to produce tears of sorrow or joy, trances, or even lunacy. Neither the lunacy, the trances, nor the tears, however, are essential parts of the conversion. They are simply the results of emotional excitement, differing in individuals according to temperament and education. If believed to have a divine origin, especially when the subjects are exposed to the contagion of immense crowds swayed by a common impulse and acted upon by oratory, hundreds may succumb to the epidemic who do not experience any moral change, while others who are thus excited may be the subjects of genuine reformation of character.

The inquiry has been made why the writer does not apply the same considerations to the miracles of Christ; why he does not sift the evidence in the same way, and explain the facts on the same principles. This question is relevant, and consists of two parts. What does the New Testament say, and is it rational to believe it?

The first relates to the issue with the faith-healers. If they performed such works as are recorded of Jesus Christ, a writer professing to believe in his divinity would be compelled to admit their claims to supernatural assistance. But the point made against them is that they do *not* perform works similar to his.

The credibility of the record concerning Christ's works is a question which cannot be raised between Christians, whether they hold the superstitions of the faith-healers or not.

It is conceded that probably no such sifting of the evidence was made as can be made of what takes place in this scientific age, that there was a predisposition to believe in miracles, and that the ascendancy of religious teachers was maintained largely by the belief of the people in their power to work miracles. To say, however, as some do, that there was no investigation, is an exaggeration. The Jews, who did not believe Christ, had every motive to examine the evidence as thoroughly as they could. Still, we have but the testimony of those who thought they saw. If they saw and understood, their testimony is conclusive; but standing alone it would not be sufficient.

Yet I believe that it is rational to accept the record, though we have not the opportunity of seeing the miracles or testing the evidence by the scientific method. A miracle of wisdom may be as convincing as a miracle of physical force. The resurrection from the dead declared of Jesus Christ could not be more contrary to the laws of nature than the conception of such a life and character as his if he never existed. His discourses, especially the Sermon on the Mount, the Parable of the Prodigal Son, and that of the Good Samaritan, are as far above human wisdom as his works transcend human power.

The prophecies which the Jews then held and still preserve, taken in connection with their character and history as a nation, raise a powerful presumption of the truth of the narrative. In the ordinary course of human events the death of Christ, after he had made such claims, would have destroyed the confidence of his apostles and scattered them; but their lives were transformed after his death, which is inexplicable unless he appeared to them again and sustained them by miraculous gifts.

Of the effect of a belief in the teachings of

Christ I have had much observation. It convinces me of their truth; for what reforms human nature, developing all that is good, sustaining it in the endeavor to suppress what is evil, supporting it in the difficulties of life and in the struggle with death, furnishes evidence of its truth, not in the scientific method, but in a way equally convincing. Because the record of facts concerning Christ is inseparably connected with these teachings, it is rational to believe it.

Later ages have had no experience of what God does when he is making special revelations to men; but these things were performed at such a time. To allege the experience of modern times against the credibility of extraordinary events *then* appears no less unphilosophical than to bring forward that record in favor of miracles *now*.

When Professor Faraday, "the father of modern experimental chemistry," delivered his great lecture on the Education of the Judgment, he began thus:

"Before entering upon the subject, I must make one distinction which, however it may appear to others, is to me of the utmost importance. High as man is placed above the creatures around him, there is a higher and far more exalted position within his view; and the ways are infinite in which he occupies his thoughts about the fears or hopes or expectations of a future life. I believe that the truth of that future cannot be brought to his knowledge by any exertion of his mental powers, however exalted they may be; that it is made known to him by other teaching than his own, and is received through simple belief of the testimony given. Let no one suppose for a moment that the self-education I am about to commend in respect of the things of this life extends to any considerations of the hope set before us, as if man by reasoning could find out God. It would be improper here to enter upon this subject further than to claim an absolute distinction between religious and ordinary belief. I shall be reproached with the weakness of refusing to apply those mental operations which I think good in respect of high things to the very highest. I am content to bear the reproach. Yet, even in earthly matters, I believe that the invisible things of him from the creation of the world are clearly seen, being understood by the things that are made, even his eternal power and Godhead; and I have never seen anything incompatible between those things of man which can be known by the spirit of man which is within him, and those higher things concerning his future which he cannot know by that spirit."

I would not shield myself behind a great name from the charge of inconsistency, but have brought forward this passage because it states, what the life of the author illustrated, the compatibility of intense devotion to the scientific method in its proper sphere, with a full recognition of its limitations, of the value of moral evidence, and of the difference between the grounds of belief in nature and revelation.

J. M. Buckley.

THE COINAGE OF THE GREEKS.

CHIEF among all the educational agencies which the artist has at his command is now, as it has been for twenty-five centuries, the sculpture of the ancient Greeks. Etruria, Rome, Egypt, Asia, no less than Byzantium, Pisa, Florence, and every home of latter-day art, have submitted to the discoveries of the ideal, and wherever a revival of true art has taken place, the pale ghost of that first and most perfect form of it has appeared in the academy more winning in its shadowy and mutilated majesty than all we have besides. Its supreme power is only to be known in the British Museum, the Louvre, the Vatican, and in Berlin; but scarcely less potent as a school of art, nor less lucid as expression of all its best qualities, is the coinage of Greece during the four centuries prior to the complete subjection of the Greek nationality and the disappearance simultaneously of independence and individuality. There are certain coins which contain in a circle of an inch in diameter most of the finest qualities of sculpture, the subtlest record of the harmonies of line and form; and, taken collectively, this coinage gives a better demonstration of the beginning, the rise, the decay, and the death of art, and perhaps also a better explanation of the causes of that growth and decline, than can be found in all the records and remains besides. The numismatic chronicle is indeed one of the most important aids of history, whether political, commercial, or economical; and Prof. Percy Gardner, in a book which ought to be among the first in the hands of every student of numismatics ("The Types of Greek Coins"), has said of Sicily what may be applied in a less extent to all Greece:

"So much has been lost of the products of the Italic and Sicilian schools of the fifth century B. C., so little do we know of their familiar terms of fashion, that in spite of the later Selinuntine sculptures, we should not have known, but for the testimony of the coins, how advanced they were and how widely spread their influence, what originality there was in the types they introduced, and what mastery they showed in the execution of those types."

The fascination which lies about all Hellenic research has more of the magic of Proteus in it when we have to deal with the coinage than with any other branch of Hellenic studies; not only because of its intimate relation to what was the incomparable and distinguishing glory of Hellenism,—art,—but because one of the most fascinating of all studies is that of the relation of the beautiful to the actual life and to the intellectual activity of men, and because the coins of Greece are inextricably entangled in the web of history of individual, state, and race. If nothing survived of all the sculpture of the ancients, Greek coinage alone would demonstrate that the race to which it owed its existence was more conversant with the qualities of beauty and had a finer spiritual constitution than any other race of which we have any kind of record. We learn from it that when all surrounding nations were buried in the barbarism of wild, or sunk in the heaviness of sensual, life, the Greeks were showing the most intense vitality and the finest mental susceptibilities as well as the purest moral qualities that mankind have ever shown, and we do not need Plato and the poets to assure us that the typical Greek of 400 B. C., and of some generations before and after, was, in all demanded by the balance of the qualities belonging to man as the intellectual and spiritual being, such as no age before or since, of which we know, has been able to show. The complexus of art, as painting, sculpture, poetry, music, or any other form that may be devised, is the truest and most absolute expression of the essential character of man that can be made. Its existence as a dominant element of nationality or individuality implies a healthy and stirring intellect, a temperament open to all the influences of nature, and a more or less vivid susceptibility to those moral emotions which are the springs of all aspirations and of all ideals, the life of our life, the animus of our complex being. The subtlety, the infinite variety, the ineffable beauty, the exalted ideal, which pervade Greek art could never have had a beginning in men who were mere materialists, sensualists, or dullards. The keen sense of beauty it shows is proclamation of a nature gifted with the keenest and subtlest perceptions of visible things as well as of a sensibility to

PERSIAN DARIC.

the impressions which the mind receives from those variations of external form that point to the ideal; and, with all the progress of civilization and science, the technical knowledge to which we have attained, the development of Christianity, of philanthropy, and of general ethics, to say nothing of the laws of material existence, we have never in our modern history known a race which was so perfect in the balance of all the positive human qualities as that which gave us Greek art. This is perhaps a truism, but the evidence of it is in the art itself; and to any one who has so far mastered the correspondence of art as to read its message, perhaps the shortest path to this evidence lies through the coinage of the Greeks.

We are in the habit of talking of schools of art. Of consummate schools there have been but three, if we use the term art in the sense in which we distinguish it from mere technique on one side or record of fact on the other,—the art which has to deal with any ideal whatsoever; these three are the Greek, the Venetian, and the Dutch. Of one or the

APHRODITE, CNIDUS.

other or all of them are born all arts, modern forms, and phases; or rather from the spirit of which these are the consummate expressions all others are more or less distinct and perfect manifestations. I am aware that there are apparent chronological reasons for disputing this so compendious classification, but in a more appropriate place for the discussion I am prepared to meet them. The Greek school is that of form and its ideal, either alone or in combinations. In its prime, and its early stages of decay, it had nothing to do with the actual, or imitation of nature, and it fell when it came to realism in portraiture. The Venetian took certain themes from nature, having no subjective ideal of form like the Greek, and clothed them

in a color which was ideal and was never imitated from nature, but rather remembered in a musical* way. It also fell in the decay of independence and national character. The Dutch school was nursed and nourished by the nature of

HEAD OF EAGLE, ELIS.

the sea-coasts and sea-level lands of Holland, strengthened by the sea winds and the freedom of the sea life. It died of commerce and materialism (not to be confounded with rationalism or the negation of the spiritual existence, but in its true sense of over-devotion to merely material objects of thought and aspiration); and, since that, we have had only fruitless efforts to establish and revive schools without any basis in national character or temperament. One thing is to be noted of these three schools:

APOLLO, KAULONIA. SIXTH CENTURY B. C.

they were the blossoming of the national lives of sea peoples, brave, imperial, passionately devoted to liberty, and they all died with the decline of national simplicity and heroic self-assertion. I do not believe that religion as such had ever anything to do with awakening art, but I do believe that, other things being equal, the more reverently and spiritually inclined a people, the more refined and exalted and the nobler will be its art. Superstitious or slavish beliefs, on the contrary, are absolutely hostile to the growth of any art whatever.

I have no intention to follow the lines of speculation which are offered by the relation of numismatics to archæology, mythology, or his

BULL, SYBARIS. 700-510 B. C.

tory, or even to treat numismatics as a science. There are many volumes on all these relations; and of manuals for scientific study, many. Lenormant's general manual, "*Monnaies et Médailles*," and Gardner's "*Greek Coins*," are accessible to all, as well as the invaluable cata-

* The very derivation of the word musical is the key to the unity of all the arts, being that which the Muse sends; and for the Greek every form of art had its separate Muse, indicating that the work was approached subjectively, with invocation and prayer; mostly nowadays with beer and pipe.

POSEIDON, POSEIDONIA. 700-480 B. C.

logue of the British Museum coins; and, of special treatises, Head's "Coinage of Syracuse" will suggest the inexhaustible material contained in the subject, and will show as a secondary result the height which art reached in a colony of

that motherland to which the world owes the most exalted art.

It is the purely artistic side of Greek coinage which, to me, furnishes the most attractive vein of study, from the clear and concise manner in which it shows the rise and decline of idealism, and the way in which the Greeks caught from other nations an idea adapted to their nature and carried it to a perfection of development of which the parent race never dreamed. The origin of coinage, *i. e.*, the stamping of ingots of gold and silver of definite weights with the seal of a sovereign to fit them

OWL.

for general circulation and acceptance as a measure of value without going through the more ancient method of weighing the precious metals at each transfer, is pretty surely Asiatic. The idea of a coinage of this character giving the well-known and authoritative warrant of an official guarantee to the metal in circulation is now generally accorded to Lydia, although it was questioned in ancient times whether Pheidon, king of Argos, might not dispute the honor. The coinages of both are of the exceedingly primitive character which befits the beginning of such a manufacture, and from the

money itself it would be difficult to decide. The work of Professor Gardner goes into this subject at some length and inclines to the Lydian origin on historical grounds, but there is one consideration which seems to me more decisive, *viz.*, that the early Lydian coins were made on a Babylonian standard; and as all know that the civilization of Babylon

was much earlier than that of Greece, the adoption of its standard would indicate that money was first coined for Babylonian usage in a gold-producing country. This Babylonia was not, the nearest to Babylon being Lydia. That this is probable is shown by the fact that Lydian pieces were coined both by the Babylonian and later by Phœnician standards, as if for commerce with both nations; and by the analogical case of the staters of Cyzicus, which were impressed with

NIKE, SYRACUSE. DEMARETEION. ABOUT 480 B. C.

RACING CHARIOT.

the types, besides that of the coining city, of the principal cities with which it was in commerce (Lenormant, p. 142); and as the earliest Lydian coins follow the Babylonian standard, we have a right to conclude that the coinage grew out of an early and large demand from that important center of commerce, at a time when Greek trade was comparatively unimportant, or completely non-existent.

But the adoption of coinage by Pheidon gave to Greece the germ of an art in what had been before only a symbol of value, and the versatile and beauty-loving Greek has shown an abundance of invention and warmth of idealization which nothing in his statuary surpasses. And we have the advantage, very rare in marble works,—rare even in bronze,—of examples quite un mutilated and even undamaged by circulation. Nothing in archæology is more surprising than the harvest of coins brought to light by excavations, or often by chance. Some workmen in Rhodes found, several years ago, an earthen pot with seventy-five pounds weight of gold coin, all staters of Philip and Alexander, and for a time the market was flooded with them to such an extent that they were sold for little more than their weight in gold. I myself got one from a Greek who asked as a favor that I would give him a pound sterling for it. Some of these had evidently never been circulated, and I got one at Athens later which had never lost the luster of the die. At Missolonghi, thirty years or more ago, another pot of the same coinage was found

ARETHUSA, SYRACUSE. 480-400 B. C.

CRAB, AGRIGENTUM. 400-480 B. C.

NIKE, TERINA. 480-400 B. C.

in the same state, and from the numerous finds of these coins of Philip and Alexander, it is clear that their circulation in the time of those sovereigns must have been enormous, and though among the most beautiful, they remain the most reasonable of the gold coins in price. Yet I have seen but two from the same dies. Fortunately for us there were no banks in those days, and people who hoarded money generally hid it in the earth or in the walls of their houses, so that the removal of ruins or the chance digging of some old field below the layer of modern accumulation is continually bringing to light small hoards of coins of all epochs, and the piece that is unique to-day may find a hundred rivals to-morrow. This makes a continual fluctuation in the price of rare coins, which is however somewhat modified by the exceeding rarity of absolute duplicates, *i. e.*, pieces struck on both sides from the same dies. I have seen in one collection about three hundred different didrachms of Taren-

tum; and of this city, of Metapontum, Thurium, Neapolis, Terina, Agrigentum, Velia, Rhegium, the smaller coins of Syracuse and some other cities of Magna Grecia, of Corinth and its colonies of Macedon, all among the most attractive of the silver coinage, the abundance is so great that they may easily be obtained in excellent condition. On the other hand, the archaic coins, which, with few exceptions, are not specially prized for their beauty, are, in general, the most valuable to the numismatist. It is only when coinage begins to become a distinct

* There is a point in Greek art not yet cleared up, but of the highest interest in this relation of early Pelasgic art to later Greek. That the Lions of Mycenæ are not later than 1500 B. C. results from the method of execution, which is in every point in accordance with that of the city itself and the domed tombs as well as from their position in the ruins. All this architecture is of the polished stone age. The causes of the break in the development of Greek art, which we must assume, to account for the non-development of sculpture in this interval of 800 years, may be of two kinds,—political, in the destruction of the Pelasgic empire of Peloponnesus by conquest; and technical, in the want of tools which would cut stone with sufficient facility. The xoana or wooden statues probably existed long before the Lions of Mycenæ were cut, but the process by which the latter were executed, being mainly drilling and trituration with stone implements, was by far too laborious to be made use of generally or by others than the trained artisans of the Pelasgic epoch, who most probably disappeared with the conquest. To a

vehicle of types, that it becomes a branch of art-study; and in the best period of numismatic art and the prime of the great commercial communities of Greece the abundance of coinage, and the constant variation in the types employed as symbols, give us most instructive and copious lessons in Greek design.

The relations of sculpture to die-cutting and of die-cutting to seal-engraving are those which present the most salient considerations in what we may call comparative art. Sculpture in Greece was long anterior to coinage. We have the sculptures of the Lion gate at Mycenæ, which, from indisputable considerations that I have given in full elsewhere, cannot be considered as later than 1500 B. C.,* or several centuries before any

APOLLO, AMPHIPOLIS. 400-336 B. C.

certain extent this must remain mere hypothesis, but I am confident of the general correctness of the direction my conjectures have taken. The sudden advance Greek art took (I conceive between 1000 and 800 B. C., when the wooden statues were abandoned largely for stone) I consider to be due to the communication of new methods from the East as a consequence of the establishment of trade with Asia Minor and Phœnicia. The early Greeks were clearly stone workers, in the main probably possessing bronze but not of quality to cut stone. But wood was still largely employed for statues. I found, when excavations were being made on the Acropolis of Athens among the *débris* of the conflagration of Xerxes, fragments of their bronze draperies with the carbonized wood still in them, unmistakably of some statues burned in the destruction of the temples by the Persians.

YOUNG HERCULES.

coinage existed; and yet these lions are of a quality of art already superior, *as art*, to any work of that hypothetical date yet found in Egypt or Assyria. The affinities of coin design are not with sculpture, which in all its early stages appears in the round; the relief, high or low, being the product of a more advanced state of art education. It is quite impossible to accept the evidence of Greek chronology of the heroic and mythical ages; the attributions of affinity and descent also are continually interfered with by national vanity and that credulity which appears always to have been a ruling trait of Greek character. We must extend the chronology beyond the year 1000 B. C. indefinitely, and fortunate are we if we can establish sequence and relative position to events or monuments. We may suppose that, before the introduction of letters into Greece and the crystallization of tradition in writing, verbal tradition may have been transmitted with some degree of accuracy for, at the most, two or three hundred years; but for all beyond this the fabulous and supernatural intermingle with a rapidly increasing ratio, so that beyond 1200 to 1100 B. C. it is absurd to build on tradition, which has become pure mythology. For this reason the beginnings of art are absolutely indiscoverable. My own conviction is that the true artistic nature, as opposed to imitative or monumental, was the original appanage of the Pelasgic race, developed in the great Italian empire built up by it, and that art came into Greece with the Tyrrhenian Pelasgi from Italy (Thucydides IV., 109). The distinguishing element in the art thus derived is

the entire subordination in it of all other elements to beauty, the expression of an ideal which, in my philosophy, is born of a distinct though possibly half-blind spiritual aspiration, the fine union of the intellectual and moral yearnings which have always distinguished the Greek art and life from that of Eastern nations. The arts of Egypt were distinctly monumental—canonical; those of Asia (other than Greek) merely decorative,* if anything more than monumental (*vid.* Professor Gardner's "Types of Greek Coins," p. 97), and each became in the least degree ideal only when invaded by the genius of Greece. I believe also that to a survival in this Pelasgic stock, the vein coming to light in an unexpected and inexplicable way, was due the revival of art in Tuscany, the ancient home of the Tyrrhene Pelasgi, to whom Thucydides alludes in the above noted passage.

But the origin of coinage was not due to art, although when the Greek took it up it became a favored vehicle for artistic expression, as did all articles of use with a people to whom beauty was the main motive of intellectual activity. It came as the proper offspring of commerce, its immediate progenitor being the personal seals and symbols, the *arms*, as we may say, of monarchs and communities. The impression of a seal on an object, or on a disk of clay attached to it, would naturally lead to the employment of the same symbols on the coin when the idea of a medium of exchange was put into practice, as the guarantee of value of the sovereign who adopted it; but while in the object whose value was in the manufacture, as an earthen pot, the name or mark of the maker was the important item, in the piece of bullion, whose value was in the certainty of the quantity of

SATRAP, COLOPHON.
400-336 B. C.

* The essential element of all pure art is in one sense decorative (if we use that word in its general sense of opposed to *useful*), and it is at bottom the love of decoration, as opposed to utility, which is the basis of all fine art, and, to a certain degree, its peculiar motive, because, if we regard any work of art in reference to its *raison d'être*, we shall see that while art has various sentiments as stimulating agencies, such as rever-

ence, record, etc., it takes the direction of pure art, *i.e.*, the embodiment of an ideal, only when the desire of embellishment or expression of beauty is dominant. The distinction of decorative and fine arts is therefore one of degree, not of kind, and we use the former when we would indicate that the art is applied to some object or purpose whose prime cause is utility, the latter when it serves no use.

metal in it, the mark of the guarantor was the only satisfactory one. When the Greek cities were the coiners, of course the symbol of the city was the appropriate mark of coinage, and here the fine sense of the race found its opportunity to embody, in the purest form of decoration the world has ever seen, all the various objects of veneration or preference of all its communities; and under the conditions which determined the nature of Greek art, it, in the later days, became ideal, as in the Syracusan coins, where the cutter of the dies signed his work, and in the head of the nymph Arethusa, of that later period when Kimon, Eukleides and Evainetos put their names on their dies—not for the glory of the nymph, but for their own. To say that this marks the decline of art would be, in reference to motive, true; but it is not the decline of absolute deterioration, but that which follows the severe schools of ideal art, and which may be called that of perfect ripeness rather than of decay. This is the relation in which the art of Scopas and Praxiteles stood to that of Phidias, and in the sense of artistic vitality there is no doubt that the former shows decline of the ideal creative powers. But art is not alone conception—it is also expression. Not alone in the vaulting imagination is the gift of the poet shown, but in the rhythmic ear, the musical sense; and the analogy holds good in graphic art, so that, with an admiration of the severe and intellectual art of Phidias second to none, I am heretic enough to admit that of the full circle of art Scopas and Praxiteles had more than Phidias, just as Titian had more than Gian-Bellini. The element of the sensuous is as determinate a part of perfect art as any other, but the distinction is in the due subordination of it to what we must consider the higher, because the more vital, element of intellectual conception. The art that begins with the sensuous becomes sensual and dies there, but that which never becomes sensuous dries up, unfruitful stock; and the art which has nearest attained perfection is that which unites all the elements in the highest degree.

But the art of the coin-maker has never the highest attainment of the intellectual side of

art—it belongs by its very purpose to the form which succeeds that, and by the analogies of its composition to Scopas rather than to Phidias. The fine taste of the Greek is shown here, for it is most interestingly demonstrated by Professor Gardner that in the better epochs of coin designing there was no copying of statues—this was reserved for the decline of art, when taste had decayed, and the poverty of invention, which follows, had come on the artists. The coin designer felt his limitation and his advantages, and his art came to perfection concurrently with that form of sculpture which most nearly corresponds with it in its element, about 350 B. C. It began later, and, so far as we can determine, began to decay earlier, than sculpture. An additional reason for this decline in

EAGLES. AGRIGENTUM.—QUADRIGA.

numismatic art would be the general acceptance of coins of commercial standard and the decline of local mints, whose rivalry in excellence we must suppose to have been an element in the art development.

But each epoch in the evolution of design has its peculiar interest, and the most archaic coins have even a certain charm of naïveté of design which is widely remote from childishness or dullness. The coins of Kaulonia, Poseidonia (Pæstum), and Tarentum, of the earliest date of which we have examples, present characteristics of design and of mintage which make them invaluable data in the history of art. They date from about 500 B. C., and are from that Magna Grecia whose greater wealth developed a higher civilization than obtained contemporaneously in Greece. They demonstrate that art is further advanced; the quaint qualities of archaic design begin already to yield to a

LOCRI OPUNTII.

AJAX.

motive of action; the Apollo of Kaulonia and the Poseidon of Poseidonia are interesting figures and show clearly the purely subjective beginnings of Greek art—that quality which made it what it became, and finally deserted it when it fell into objectivity in the attempt to copy nature. The artist who had the power of design either of those coins shows, the “go,” to use a common but expressive term, had he been set to copy nature, could not possibly have given his figure the impossible action it has on the coin. One sees clearly that he worked from an idea of power and dignity which he must express without regard to the limitations of human anatomy. Apollo strikes, and Poseidon launches his trident, with the fury which no purely natural attitude could have expressed, but which belong to the idea rather than to nature. The head of Athena, which for centuries was the type of Athens, shows still more clearly how entirely the artist embodied an incorrectly but sharply defined idea. The absolute profile which was alone possible to the incomplete art of the time is united with the full eye which the artist was accustomed to see in the human face, and which alone had to him the value of expression. A momentary comparison with nature would have shown the impossibility of such a combination, but that momentary comparison was never made. The whole development of Greek art, to the day in which, leaning

PALLAS, COLONY OF CORINTH.

on nature, it began to grow feeble and walk lame, is simply the history of the education of this ideal vision, the perfection of the subjective image which, so long as it was born of the Muse, was immortal, and began to fall into decay with the appeal

to nature for its sustenance.

The mintage of Greece proper is perhaps behind that of Italy, and still more behind that of Sicily, in the development of its best art, and in the early stages all are, so far as we know, behind sculpture. In fact, the art of relief always requires, to be of equal merit, a more complete education than the sculpture of the round; but the enormous amount of designing required to supply with coin reliefs all the mints of Greece and her colonies, and the

freedom and facility thus acquired, no doubt helped materially all the arts of design in the days of their highest glory. The complete independence of the Greek cities and communities, which had doubtless much to do with the progress of the entire race as with its fatal dissensions and subjection in later times, was one of the most powerful stimulants of the arts, and especially that of coinage. There was no supreme coinage: all stood on their merits and good reputations. The mental characteristic of the race, which we may fail to explain but cannot question,—its intense love of beauty,—made it necessary to make the coinage beautiful: the “he touched nothing that he did not adorn” was never so true as of the Greek of the centuries from 600 to 200 B. C., and the amount of industry expended on the coins may be faintly conceived from the enormous number of types existing of the leading and most familiar coins, and from the number of mints known to have existed. Says Professor Gardner:

“Lapse of time has doubtless deprived us of the coins of hundreds of independent cities, yet enough remains to show us to what extent subdivision of independence was carried in Greece. We have money of more than fifty Greek cities of Sicily: the little island of Coos, not ten miles across, had three active mints. At least fifteen cities of the remote district of Acarnania have left us coinages, some of them of great extent and variety. The number of towns of which coins are mentioned in Mionnet is nearly fifteen hundred; and since the publication of that work we have scores of new cities to add to the list. Little hill-fortresses, the inhabitants of which must have been numbered not by thousands but by hundreds, had their own types and their own mint, jealously guarding their right of coinage with the aid of two of the strongest sentiments of the Hellenic race, the love of autonomy and commercial jealousy.” (“Types of Greek Coins,” p. 26.)

To their emulation and intense mental and social activity, to the rivalry of cities and jealousy of communities, one element of the intellectual life of Greece, the love of art, owed probably a great part of its pabulum. The political problems to which the coinage furnishes a clew are for the historian and the political economist; to our purpose, the trivial fact that the die was cut in soft metal, probably bronze, and necessarily with great rapidity and freedom, had probably more importance in the development of the taste of the Greeks and

the education in decorative art than any other simple item. From the very beginning there is a dominant love of decoration; the field of the coin is always filled with tastefully arranged material—in the earlier coins where the incuse square is employed, as in the coins of Athens, the square itself is made to play a part in the composition, yet it was originally only a device to drive the metal well into the recesses of the die underneath. The owl is arranged as the main line of the diagonal composition, and the corners then left vacant are filled with the olive leaf and the signature of the city, abbreviated to the space. And in the coin of Amphipolis, centuries later, the same motive crops out, again accentuated and insisted on by the inner square, which probably typifies the city wall and the inscription following its form. In the whole duration of Greek artistic vitality this decorative sense is predominant: the composition, the balance or rhythm of parts, is invariably kept in view in all the arrangement of symbols. The reverse of the archaic Demareteion or decadrachm of Gelon is a superb example of the coin design of epoch 480 B. C., and is superior to anything we know of Greek contemporary coinage. The way in which the whole field is filled up—the lion in the exergue, the victory floating above, the pose of the driver, the arrangement of the horses' heads, all disposed rhythmically, and yet without violence—makes this noble coin one of the most valuable we possess, though not one of the rarest. Its history, too, is interesting beyond the interest of mere Greek money.

In 480 Gelon defeated the Carthaginians at Himera, and, through the influence of his wife, Demarete, accorded them such favorable terms that they in gratitude gave her a hundred talents of gold, which were employed in a coinage of decadrachms, the earliest known of

this denomination, and were called, after the name of the queen, Demarateia. The obverse, with its border of dolphins, the olive wreath and inscription, is decorative throughout. Of the same period the reverse of the coin of Naxos, the coins of Selinous and Thurium generally, are charming examples of pure decoration. The manner in which the artist has filled up the field of the Naxian coin is very skillful.

In the later coinages we have the motive carried out with still finer art in the didrachm of Heraclea, a colony of Magna Grecia, which is to my mind one of the most exquisite pieces of decorative design in the whole of Greek numismatics, both reverse and obverse being of the most charming character. The Hercules on the obverse of the didrachm of Croton; the Thurian bull with its obverse of Pallas, whose helmet is ornamented with the sea monster Scylla; the little Hercules strangling the serpents, of Croton; the coins of Tarentum continually, and of Sicily in general at this epoch, are most instructive in their lovely decorative feeling.

But in Sicily at this period came in those types of beauty which mingle with the purely decorative work of the coin designer something of the ideal beauty which Athenian art showed in the time of Praxiteles and Scopas. The decadrachm of Syracuse, which is, when all is weighed in our comparison, the most glorious survival of Greek numismatics, exhausts the refinement of profile relief. (See cut below.) It has three profile types of the Arethusa head, varying slightly in development of the purely sensuous beauty of the nymph. As it has been the most admired, it probably has been the most counterfeited, of all the Greek coins.

But with all this beauty and perfection of

technical achievement we can never confound the art of coinage even with that which it best coincides with in its perfection, the sculpture of Scopas: the severer and loftier, certainly more ascetic, art of the Phidian stage is rarely presented in coins. The die-cutter does not seem ever to have been accepted as an artist of the higher class, and we know from Plutarch that even the greatest artists were looked upon only as a superior class of artisans; and it is only after coinage had almost ceased to be regarded as an art vehicle, *i. e.*, in Roman imperial times, that the coin or gem engraver becomes known to the world as an object of respect. This came to the sculptor and painter alike, mainly by the vanity of rulers, Alexander leading the public of antiquity into what was before his time regarded as the desecration of art,—portraiture,—and into a compensating higher esteem of the artist. As art became a minister to the pleasure and personal exaltation of man, so the artist became a higher dignitary in the worship which was becoming the worship of self. Phidias was imprisoned because he dared to put his portrait among the decorations of the Athena; Apelles was enriched because he painted that of Alexander.

But there is another consideration which must not be lost sight of in this reckoning: the art of Phidias and the pure ideal which attains, through the highest culture, a power over the taste of the highly cultured, is in its general effect enormously outweighed in its

influence over the public of moderate cultivation by the art which, without becoming degraded, finds its expression more in the sensuous types that suggest the possibility of human embodiment. The Arethusa of the best coinage of Syracuse, the Ceres of Opus, the types of Metapontum, Catania, the young Hercules of Camarina, the fascinating full-face heads of Amphipolis, Syracuse, etc., have a beauty of a peculiar type, and which, I must say, without irreverence for the Phidian type and the severe art of the more heroic type, does possess certain elements of human beauty not found in the Elgin marbles. I admit, that while my admiration for the Theseus and Ilissus has no weakening, I believe that the Melian Victory* comes nearer to the perfection of the beauty which is nearest us—the purely physical—than anything in the earlier phase. The highest stages of cultivation alone can honestly accept the severer types as most delectable, and their

PORTRAIT OF ALEXANDER THE GREAT, 324-282 B. C. FALLAS.
COIN OF LYSIMACHUS, KING OF THRACE.

authoritative character is imposed upon the less educated. There is an affectation of superior admiration of the severe type which in the real feeling of the amateur is often not accompanied by the corresponding appreciation. Let us at least be honest with our tastes, and even the people who do really admire Bouguereau rather than Watts will rise to better things; but admiration by authority has just the value of love through sense of duty.

* The theory proposed by me in a former paper in THE CENTURY — of the Victorian character of the so-called Venus of Melos — has been accepted by many students of ancient art as sufficiently established for acceptance as the most probable attribution. It ventured much, but on grounds which bring us continually slight confirmations. In coinage I find an indication in the staters of Cyzicus, coined about 431 B. C. Nike is draped as the Victory of Melos, and here

there is no kind of uncertainty as to the type, as she has her wings. It appears also repeated in a coin of Agathocles (317-310 B. C.), and Gardner here notices the resemblance to the Melian statue, although, with a conservatism which is as a general rule a prudent and praiseworthy tendency in serious archaeologists, he hesitates about proposing any connection. The theory, utterly unsupported by any evidence in fact or analogy, that this statue was a Venus has paralyzed the conjecture of archaeologists — they have never dared go out of the relation of Aphrodite to find her place. Gardner says of the Agathocles coin: "In artistic motive there certainly is a likeness between her and the Aphrodite of Melos; but the likeness is probably one of those which spring from proximity of period rather than one which denotes similar meaning." But what likeness is there, or what analogy, to determine the Melian statue an Aphrodite? Not the slightest. No similar, authoritatively determined, Aphrodite exists, while the type as Nike occurs continually.

ZEUS, COIN OF PHILIP II. OF MACEDONIA. 359-336 B. C.

PORTRAIT OF ALEXANDER THE GREAT, COIN OF ALEXANDER ÆGUS. 323-311 B. C. ENLARGED.

The introduction of portraiture in coinage was the result of two potent influences coöperating from opposing directions,—the decline of art and degradation of all ideal types (I believe owing to moral debasement), with consequent loss of the inspirational element in art, and the change in the form of national sovereignty from popular to personal. The old coins carried the legend of the people, Athenaiōn, Syracusaïōn, the Ethnic in the genitive plural. After the reign of despots—Philip, Alexander, Hiero, etc.—had made the people accustomed to the extinction of all popular rights, the coins were inscribed with the name of the despot. But the head which the beautiful stater of Philip wears is still that of the young Hercules, and Alexander never put his own head on his money. Later the gods gave

way, and the coinage became the record of the pride of mere humanity. The apotheosis of Alexander took place only under Ptolemy and Lysimachus, whose coins bear the portrait of Alexander with the attributes of Hercules; but under their successors the coinage becomes a gallery of portraiture, a compensation for us which atones for many artistic failings. But as portraiture what a history we have! Art had not yet lost its power, only its best motives. The old gods had passed with the slow revolution of ages, and the new ones were of other types; art caught at the human, grateful to be relieved from straining after the divine it no longer loved or believed in. That it had not lost its cunning is seen in the archaistic Athene of the coins of Alexander Ægus, that unfortunate prototype of the Duke of Reichstadt and Prince Imperial of France. And the head on the tetradrachm of Lysimachus merits the rank of first among portrait medallions. Then came Mithridates IV., Prusias of Bithynia, Philetærus of Pergamus, and a line of kings, who later yield to the Roman consul, imperator, etc., etc. But what the art of design had become by this, we may see in the reverse of Mithridates Eupator.

Here and there we catch through this personal side of numismatics a glimpse of romance

PALLAS-ATHENE, ATHENS.

of which an instance, altogether delightful, is that connected with one of the loveliest of that portrait series of Syracusan coins, the Philistis, wife of Hiero II., King of Syracuse, a Syracusan officer who, after the departure of Pyrrhus from Sicily, became, by popular choice, supreme in the government. His reign was long, just, and prosperous. His coinage is mainly a commemoration of his wife (whose head is thus one of the earliest female portraits, if not the first, borne by coins), and of his son who died before him. The head of Philistis has a charm of individuality inexpressibly touching in the best

PHILISTIS, WIFE OF HIERO II. 269-215 B. C.
STILLMAN COLLECTION. BRITISH MUSEUM.

examples,* but there are many coins which appear, by their variation from the likeness and type, to have been coined after her death, and to have merely a traditional and fading resemblance. Philistis was a woman of Syracuse, daughter of a wealthy citizen, and there is a singular interest thrown about this lovely head by the knowledge that in the fifty years of Hiero's reign he struck only one type of money with his own head, and that in all the rest of his reign, with the exception of the very early is-

* The illustration is from a coin I purchased at Athens some years ago and is taken from a cast. The later and deteriorated work is shown in the British Museum type, and will show the difference I allude to.

PHILÆTÆRUS. 241-197 B. C.

PALLAS.

sues, he showed his devotion to his wife and child by perpetuating their images in his coinage. The head of Gelon, his son, bears a resemblance to Philistis. Of his life or theirs we know but little; Syracuse was happy enough in his reign of half a century to leave almost no history, no record of conquest, disaster, or rebellion; but to me this mute witness, by a coin nearly twenty-two centuries old, of the happiness and devotion of a king dominates all the glories of Sicilian history — that little taper of domestic bliss, a spark for the

ANTIOCHUS IV., EPIPHANES. 176-164 B. C. ZEUS.

imagination alone to deal with, shines beyond the conflagration of conquest and the glitter of military glory. If Dante had known their story he would have put Hiero and Philistis among the good who lived before Christ, blest if not redeemed.

Counterfeiters are the especial enemy of numismatists. The electrotypes of the British Museum, while offering to the student enormous facilities, also fall into the way of the counterfeiter, whose success now is such that I have no doubt that many coins pass unchallenged even by the best connoisseurs. The keeper of one of the Italian museums told me that the manufacture of counterfeit gold coins of Sicily had been carried to such perfection that he no longer ventured to buy them unless he knew where they were found.

MITHRADATES IV., KING OF PONTUS.
240-190 B. C.

A friend, who is one of the principal private collectors in Europe and whose cabinet contains 10,000 varieties of antique coins, called me in one day to give him an opinion on some decadrachms of Syracuse which he had purchased as part of a large collection. One was clearly a counterfeit, and caused no hesitation, but another was so admirably done that we were both inclined to accept it as genuine. I noticed at length that the reins of the horses in the quadriga of the reverse were arranged so that all the four off reins passed around the outer side of the off horse's neck, which struck

PRUSIAS I., KING OF BITHYNIA. 228-180.

ZEUS.

MITHRADATES VI., EUPATOR. 123-64 B. C.

STAG.

me as singular for a Greek, who must have seen the quadriga habitually and known that a pair of reins went direct to each horse. This led me to compare it with a series, and I at length found a genuine coin which had the same design and differed only in having the reins properly disposed, one going to the off side of each horse's neck. The suspected coin was in all other respects an absolute copy of the genuine, even to the least detail of the obverse, only showing in the locks of the Arethusa slightly greater heaviness of forms, as might be expected from a laborious copy. Now a Greek might have been unobservant enough to make the reins wrong in his haste, but not at the same time careful enough to copy in every other detail another pair of dies. No two dies have ever been found, probably never have been made, which agreed in all the details — the character of Greek art forbids it; but to find two dies agreeing in design with those of another coin, except in this slight but important detail, is beyond the theory of possibilities.

I have seen coins which have long lain undisturbed in the cabinet as originals suddenly thrown into doubt by the appearance of numbers of an identical coinage, and I once purchased at Athens a didrachm of Elis, for which I was offered by one of the oldest and most

experienced numismatists there a large advance on the price I paid, and which passed the examination of several important collectors, but was finally, and only after being at first accepted as original, thrown out by the authorities of the Bibliothèque Nationale of Paris. When we consider that \$100 to \$500 is often paid for very rare coins, it will be seen that the inducements to counterfeiting are very great and the danger to the collectors corresponding. I do not believe that any judgment is infallible in this matter, but when we cannot determine if a coin be genuine or a copy, we who love it for its beauty alone may leave the numismatists their joys and perils alike and be content where we cannot be mistaken.

It will remain probably a dream that in our new republic, where, in some respects, the conditions of political existence so resemble those of old Greece, we shall employ our coinage as the Greeks did; though, if we cannot rival Kimon and Evainetos, we might at least from afar and at our best emulate Greek beauty. As it is, even the coins of the least Central American States are examples to us; for, of all civilized nations, our mint mothers the most barbarous products.

William J. Stillman.

[The illustrations in this article are from coins in the collection of Dr. Charles E. West, Alexander Balmano, R. H. Lawrence, Gaston L. Feuardent, Robert Hobart Smith, Canon Greenwell, and the British Museum.—EDITOR.]

JEWISH SHEKEL.

SIMON MACCABÆUS. 140-137 B. C.

LITTLE JACK.

(DEDICATED TO JOHN DABNEY, RICHMOND, VA.*)

YES, suh, 'twuz jes' 'bout sundown
Daddy went, two mont's ago;
I al'ays used to run down
At dat time, becaze, you know,
I wouldn' like to 'a' had him die,
An' no one nigh.

You see, we couldn' git him
To come 'way off'n dat lan',
He said *new* house didn' fit him
No mo' 'n new shoes did, an'
Gord mout miss him at Judgment-day
Ef he moved 'way.

Well, when, as I wuz sayin',
Dat night I come on down,
I seen his bench was layin'
Flatsided on de groun';
An' I kind o' hurried to 'des de do'—
Quick-like, you know.

Inside I seen him layin'
Back, quiet on de baid,
An' I hearn him kep on sayin',
"Dat's what de Marster said,
An' Marster warn' gwine tell me lie,
He'll come bym'bye."

I axed how he wuz gittin',—
"Nigh to de furrows' een,"
He said; "to-day son settin'
Outside de do'—I seen
De thirteen curlews come in line,
An' knowed de sign.

"You know de Marster tole me
He'd come for me b'fo' long;
B'fo' you wuz born he sol' me;
But den he pine' so strong,
He come down arter Little Jack,
An' buyed him back.

"I went back to dat ker'idge,
An' took dem reins ag'in;—
I druv him to his mar'ige;
An' nigger 'twuz a sin
To see de high and mighty way
I looked dat day.

Jes' den his strength seemed fallin';
An' he shet his eyes awhile;
An' den said, "Heish! he's callin'! —
Dyah he'! Now watch him smile! —
Yes, suh;— you niggers jes' stan' back!
Marster, heah's Jack."

"Dat coat had nary a button
Skusin' hit wuz of gol'! —
My hat —! but dat warn' nuttin'! —
'Twuz powerful to behol'
De way dem horses pawed de air
Wid me up dyah.

"Now, all's wo'ed out befo' me,—
Marster, an' coat, an' all!
I only's lef! You know me!
Cheat-wheat's de las' to fall!
De rank grain bends wid its own weight,
De *light* stands straight.

"But heah! I daw'n' † keep him waitin';
So I mus' tell you,— raise
De j'ice dyah, neaph de platin',—
De sweat of many days
Is in dat stockin',— toil, and pain
In sun an' rain.

"I wucked to save dem figgers
To buy you; but de Lord
He sot free all de niggers,
Same as white folks b'fo' Gord!
Free as de crows,— free as de stars,—
Free as ole — hyahs!

"Now, son, you teck dat money,
Git on young Marster's track,
An' pay it to him, honey:
An' tell him, Little Jack
Wucked forty year dis Christmas come,
To save dat sum;

"An' dat 'wuz for ole Marster,
To buy your time from him,
But dat de war comed farster,
An' squandered stock an' limb;—
Say *you* kin wuck, an' don' need none,
An' he cyarnt, son.

"He ain't been used to diggin'
His livin' out de dut;
He cyarnt drink out'n a piggin'
Like you, an it would hut
Ole Marster's pride, an' meck him swar,
In glory dyah."

Thomas Nelson Page.

* When the war closed, John Dabney, a former slave of Miss De Jarnett of Caroline Co., had purchased his freedom from her, on which account he still owed a balance of several hundred dollars. He sent his former mistress this sum after the close of the war. She

returned it promptly; but he took the money and went to her home and insisted on her accepting it, declaring that it was a just debt, that his old master paid his debts, and that he paid his debts also like an honest man.
† Don't want.

BY THE WATERS OF BABYLON.

LITTLE POEMS IN PROSE.

I. THE EXODUS. (AUGUST 3, 1492.)

HE Spanish noon is a blaze of azure fire, and the dusty pilgrims crawl like an endless serpent along treeless plains and bleached high-roads, through rock-split ravines and castellated, cathedral-shadowed towns.

2. The hoary patriarch, wrinkled as an almond shell, bows painfully upon his staff. The beautiful young mother, ivory-pale, well-nigh swoons beneath her burden; in her large enfolding arms nestles her sleeping babe, round her knees flock her little ones with bruised and bleeding feet. "Mother, shall we soon be there?"

3. The youth with Christ-like countenance speaks comfortably to father and brother, to maiden and wife. In his breast, his own heart is broken.

4. The halt, the blind, are amid the train. Sturdy pack-horses laboriously drag the tented wagons wherein lie the sick athirst with fever.

5. The panting mules are urged forward with spur and goad; stuffed are the heavy saddlebags with the wreckage of ruined homes.

6. Hark to the tinkling silver bells that adorn the tenderly-carried silken scrolls.

7. In the fierce noon-glare a lad bears a kindled lamp; behind its network of bronze the airs of heaven breathe not upon its faint purple star.

8. Noble and abject, learned and simple, illustrious and obscure, plod side by side, all brothers now, all merged in one routed army of misfortune.

9. Woe to the straggler who falls by the way-side! no friend shall close his eyes.

10. They leave behind, the grape, the olive, and the fig; the vines they planted, the corn they sowed, the garden-cities of Andalusia and Aragon, Estremadura and La Mancha, of Granada and Castile; the altar, the hearth, and the grave of their fathers.

11. The townsman spits at their garments, the shepherd quits his flock, the peasant his plow, to pelt with curses and stones; the villager sets on their trail his yelping cur.

12. Oh the weary march, oh the upturned roots

of home, oh the blankness of the receding goal!

13. Listen to their lamentation: *They that ate dainty food are desolate in the streets; they that were reared in scarlet embrace dung-hills. They flee away and wander about. Men say among the nations, they shall no more sojourn there; our end is near, our days are full, our doom is come.*

14. Whither shall they turn? for the West hath cast them out, and the East refuseth to receive.

15. O bird of the air, whisper to the despairing exiles, that to-day, to-day, from the many-masted, gayly-bannered port of Palos, sails the world-unveiling Genocse, to unlock the golden gates of sunset and bequeath a Continent to Freedom!

II. TREASURES.

1. THROUGH cycles of darkness the diamond sleeps in its coal-black prison.

2. Purely incrustated in its scaly casket, the breath-tarnished pearl slumbers in mud and ooze.

3. Buried in the bowels of earth, rugged and obscure, lies the ingot of gold.

4. Long hast thou been buried, O Israel, in the bowels of earth; long hast thou slumbered beneath the overwhelming waves; long hast thou slept in the rayless house of darkness.

5. Rejoice and sing, for only thus couldst thou rightly guard the golden knowledge, Truth, the delicate pearl and the adamant jewel of the Law.

III. THE SOWER.

1. OVER a boundless plain went a man, carrying seed.

2. His face was blackened by sun and rugged from tempest, scarred and distorted by pain. Naked to the loins, his back was ridged with furrows, his breast was plowed with stripes.

3. From his hand dropped the fecund seed.

4. And behold, instantly started from the prepared soil a blade, a sheaf, a springing trunk, a myriad-branching, cloud-aspiring tree. Its arms touched the ends of the horizon, the heavens were darkened with its shadow.

5. It bare blossoms of gold and blossoms

of blood, fruitage of health and fruitage of poison; birds sang amid its foliage, and a serpent was coiled about its stem.

6. Under its branches a divinely beautiful man, crowned with thorns, was nailed to a cross.

7. And the tree put forth treacherous boughs to strangle the Sower; his flesh was bruised and torn, but cunningly he disentangled the murderous knot and passed to the eastward.

8. Again there dropped from his hand the fecund seed.

9. And behold, instantly started from the prepared soil a blade, a sheaf, a springing trunk, a myriad-branching, cloud-aspiring tree. Crescent shaped like little emerald moons were the leaves; it bare blossoms of silver and blossoms of blood, fruitage of health and fruitage of poison; birds sang amid its foliage and a serpent was coiled about its stem.

10. Under its branches a turbaned mighty-limbed Prophet brandished a drawn sword.

11. And behold, this tree likewise puts forth perfidious arms to strangle the Sower; but cunningly he disentangles the murderous knot and passes on.

12. Lo, his hands are not empty of grain, the strength of his arm is not spent.

13. What germ hast thou saved for the future, O miraculous Husbandman? Tell me, thou Planter of Christhood and Islam; tell me, thou seed-bearing Israel!

IV. THE TEST.

1. DAYLONG I brooded upon the Passion of Israel.

2. I saw him bound to the wheel, nailed to the cross, cut off by the sword, burned at the stake, tossed into the seas.

3. And always the patient, resolute, martyr face arose in silent rebuke and defiance.

4. A Prophet with four eyes; wide gazed the orbs of the spirit above the sleeping eyelids of the senses.

5. A Poet, who plucked from his bosom the quivering heart and fashioned it into a lyre.

6. A placid-browed Sage, uplifted from earth in celestial meditation.

7. These I saw, with princes and people in their train; the monumental dead and the standard-bearers of the future.

8. And suddenly I heard a burst of mocking laughter, and turning, I beheld the shuffling gait, the ignominious features, the sordid mask of the son of the Ghetto.

V. CURRENTS.

1. VAST oceanic movements, the flux and reflux of immeasurable tides oversweep our continent.

2. From the far Caucasian steppes, from the squalid Ghettos of Europe,

3. From Odessa and Bucharest, from Kief and Ekaterinoslav,

4. Hark to the cry of the exiles of Babylon, the voice of Rachel mourning for her children, of Israel lamenting for Zion.

5. And lo, like a turbid stream, the long-pent flood bursts the dykes of oppression and rushes hitherward.

6. Unto her ample breast, the generous mother of nations welcomes them.

7. The herdsman of Canaan and the seed of Jerusalem's royal shepherd renew their youth amid the pastoral plains of Texas and the golden valleys of the Sierras.

VI. THE PROPHET.

1. MOSES BEN MAIMON lifting his perpetual lamp over the path of the perplexed;

2. Hallevi, the honey-tongued poet, wakening amid the silent ruins of Zion the sleeping lyre of David;

3. Moses, the wise son of Mendel, who made the Ghetto illustrious;

4. Abarbanel, the counselor of kings; Alcharisi, the exquisite singer; Ibu Ezra, the perfect old man; Gabirol, the tragic seer;

5. Heine, the enchanted magician, the heart-broken jester;

6. Yea, and the century-crowned patriarch whose bounty engirdles the globe;—

7. These need no wreath and no trumpet; like perennial asphodel blossoms, their fame, their glory resounds like the brazen-throated cornet.

8. But thou—hast thou faith in the fortune of Israel? Wouldst thou lighten the anguish of Jacob?

9. Then shalt thou take the hand of yonder castaned wretch with flowing curls and gold-pierced ears;

10. Who crawls blinking forth from the loathsome recesses of the Jewry;

11. Nerveless his fingers, puny his frame; haunted by the bat-like phantoms of superstition is his brain.

12. Thou shalt say to the bigot, "My Brother," and to the creature of darkness, "My Friend."

13. And thy heart shall spend itself in fountains of love upon the ignorant, the coarse, and the abject.

14. Then in the obscurity thou shalt hear a rush of wings, thine eyes shall be bitten with pungent smoke.

15. And close against thy quivering lips shall be pressed the live coal wherewith the Seraphim brand the Prophets.

VII. CHRYSALIS.

1. LONG, long has the Orient-Jew spun around his helplessness the cunningly enmeshed web of Talmud and Kabbala.

2. Imprisoned in dark corners of misery and oppression, closely he drew about him the dust-gray filaments, soft as silk and stubborn as steel, until he lay death-stiffened in mummied seclusion.

3. And the world has named him an ugly worm, shunning the blessed daylight.

4. But when the emancipating springtide breathes wholesome, quickening airs, when the Sun of Love shines out with cordial fires, lo, the Soul of Israel bursts her cobweb sheath, and flies forth attired in the winged beauty of immortality.

Emma Lazarus.

MEMORANDA ON THE CIVIL WAR.

General Hancock and the Artillery at Gettysburg.

GENERAL HUNT, in his article on "The Third Day at Gettysburg," criticises General Hancock's conduct of his artillery, on the ground that his directing the Second Corps batteries to continue firing through the Confederate cannonade was both an encroachment upon his own (General Hunt's) proper authority, as chief of artillery of the Army of the Potomac, and an act of bad policy. On the latter point he says:

"Had my instructions been followed here, as they were by McGilvery, I do not believe that Pickett's division would have reached our line. We lost not only the fire of one-third of our guns, but the resulting cross-fire, which would have doubled its value."

This, it will be seen, constitutes a very severe impeachment.

I have had much correspondence and conversation with General Hancock on the subject; and, as the heroic leader of the Second Corps can no longer reply for himself, I beg leave to speak on his behalf.

In the first place, two antagonistic theories of authority are advanced. General Hancock claimed that he commanded *the line of battle* along Cemetery Ridge. General Hunt, in substance, alleges that General Hancock commanded the infantry of that line; and that he himself commanded the artillery.

Winfield S. Hancock did not read his commission as constituting him a major-general of infantry; nor did he believe that a line of battle was to be ordered by military specialists. He knew that by both law and reason the defense of Cemetery Ridge was intrusted to him, subject to the actual, authentic orders of the commander of the Army of the Potomac, but not subject to the discretion of one of General Meade's staff-officers. General Meade could, under the President's order, have placed a junior at the head of the Second Corps; but whomever he did place over the corps became thereby invested with the whole undiminished substance, and with all the proper and ordinary incidents of command.

So much for the question of authority. On the question of policy there is only to be said that a difference of opinion appears between two highly meritorious officers — one, the best artillerist of the army; the other, one of the best, if not the best, commander of troops in the army — as to what was most expedient in a given emergency. Unquestionably it would have been a strong point for us if, other things equal, the limber chests of the artillery had been full when Pickett's and Pettigrew's divisions began their great charge. But would other things have been equal? Would the ad-

vantage so obtained have compensated for the loss of *morale* in the infantry which might have resulted from allowing them to be scourged, at will, by the hostile artillery? Every soldier knows how trying and often demoralizing it is to endure artillery fire without reply.

Now, on the question thus raised, who was the better judge, General Hunt or General Hancock? Had Henry J. Hunt taken command of a brigade of infantry in 1861, had he for nearly two years lived with the infantry, marching with them, camping among them, commanding them in numerous actions, keeping close watch of their temper and spirit, observing their behavior under varying conditions and trials, I believe that he would, by the 3d of July, 1863, have become one of the most capable and judicious corps commanders of the army. But in so doing he would necessarily have forfeited nearly all of that special experience which combined with his high intelligence and great spirit to make him one of the best artillerists whom the history of war has known. Certainly a service almost wholly in the artillery could not yield that intimate knowledge of the temper of troops which should qualify him, equally with Hancock, to judge what was required to keep them in heart and courage, under the Confederate cannonade at Gettysburg, and to bring them up to the final struggle, prepared in spirit to meet the fearful ordeal of Longstreet's charge. Hancock had full authority over that line of battle; he used that authority according to his own best judgment, and he beat off the enemy. That is the substance of it.

BOSTON, Jan 12, 1887.

Francis A. Walker.

General Warren on Little Round Top.

A LETTER FROM HIS WIDOW.

IN General Hunt's paper in the December CENTURY, the account of the occupation of Little Round Top is introduced in the following words:

"As soon as Longstreet's attack commenced, General Warren was sent by General Meade to see to Little Round Top," etc.

Truth and history require me to say that when General Warren, at the action of the 2d of July, was sent, at his own suggestion, to the left, it was with no specific reference on General Meade's part to Little Round Top. As bearing on this point, I transcribe from a letter dated July 13, 1872, from General Warren, the following extract:

"Just before the action began in earnest on July 2d, I was with General Meade, near General Sickles, whose troops seemed very badly disposed on that part of the

field. At my suggestion, General Meade sent me to the left to examine the condition of affairs, and I continued on till I reached Little Round Top. There were no troops on it, and it was used as a signal station. I saw that this was the key of the whole position, and that our troops in the woods in front of it could not see the ground in front of them, so that the enemy would come upon them before they would be aware of it. The long line of woods on the west side of the Emmettsburg road (which road was along a ridge) furnished an excellent place for the enemy to form out of sight, so I requested the captain of a rifle battery just in front of Little Round Top to fire a shot into these woods. He did so, and as the shot went whistling through the air the sound of it reached the enemy's troops and caused every one to look in the direction of it. This motion revealed to me the glistening of gun-barrels and bayonets of the enemy's line of battle, already formed and far outflanking the position of any of our troops; so that the line of his advance from his right to Little Round Top was unopposed. I have been particular in telling this, as the discovery was intensely thrilling to my feelings, and almost appalling. I immediately sent a hastily written dispatch to General Meade to send a division at least to me, and General Meade directed the Fifth Army Corps to take position there. The battle was already beginning to rage at the Peach Orchard, and before a single man reached Round Top the whole line of the enemy moved on us in splendid array, shouting in the most confident tones. While I was still all alone with the signal officer, the musket-balls began to fly around us, and he was about to fold up his flags and withdraw, but remained, at my request, and kept waving them in defiance. Seeing troops going out on the Peach Orchard road, I rode down the hill, and fortunately met my old brigade. General Weed, commanding it, had already passed the point, and I took the responsibility to detach Colonel O'Rourke, the head of whose regiment I struck, who, on hearing my few words of explanation about the position, moved at once to the hill-top. About this time First Lieutenant Charles E. Hazlett of the Fifth Artillery, with his battery of rifled cannon, arrived. He comprehended the situation instantly and planted a gun on the summit of the hill. He spoke to the effect that though he could do little execution on the enemy with his guns, he could aid in giving confidence to the infantry, and that his battery was of no consequence whatever compared with holding the position. He staid there till he was killed. I was wounded with a musket-ball while talking with Lieutenant Hazlett on the hill, but not seriously; and, seeing the position saved while the whole line to the right and front of us was yielding and melting away under the enemy's fire and advance, I left the hill to rejoin General Meade near the center of the field, where a new crisis was at hand."

I would not claim for General Warren that he did more than his duty, but that he should have whatever of credit is due for the heroic resolution to accept so grave a responsibility, and an appreciation of the inspiration or genius which recognized this to be a turning-point of that supreme battle. This is conceded to General Warren by Swinton, General Abbot, Comte de Paris, General F. A. Walker, and other historians.

Emily F. Warren.

More Light on "The Reserve at Antietam."

AFTER reading the article of Colonel Thomas M. Anderson on the above subject in the September (1886) number of *THE CENTURY* and the reply of General Porter in the January (1887) number, I feel as if a word or two on the subject might clear up a little of the obscurity connected therewith. The note in question may have been delivered as stated, but that Captain Dryer did not reach the enemy's lines by three hundred or four hundred yards, I know personally, for I had to go to him at the farthest point of his advance. In this, therefore, some one seems to have been mistaken, as well as in the object for which the Second,

Fourth; and a battalion of the Twelfth United States regiments were sent across Antietam Creek. As Adjutant-General of the First Brigade of Regulars, I was ordered to detail a regiment to support (I think it was) Tidball's battery, which had been ordered, and was about to take position on the Boonsboro' pike, on the Sharpsburg side of the bridge over Antietam Creek, near J. Meyer's house. The roster decided that the Twelfth should be the regiment, and Captain (now Colonel) M. M. Blunt, who was in command, was ordered to do the work.

Tidball went into position, and I believe had eight or ten horses killed before he could fire a shot—even if he did fire one. It was madness to stay there, however, for the little good to be accomplished, and he withdrew. At the first onslaught I was ordered to send another regiment, and the lot fell to the Fourth Infantry, commanded by Captain Hiram Dryer, who was senior to all the other officers on that side of the creek. When he obtained the position where Tidball was supposed to be, the battery was not there; but the location for the regiments was a good one, and being less subject to the enemy's fire where they were than where they had been, no order was given for their withdrawal, General Sykes supposing that in the absence of proper orders to advance the troops would remain quiet. Gallant and impetuous as Dryer always was, he could not remain idle, and it was soon observed that he was pushing his men forward on each side of the pike towards the crest occupied by the enemy, with a view, as it was afterwards understood, to charge and take a battery there.

Having observed this, and knowing it was not the intention, nor could we afford, at that particular time, to make any forward movement on the center, I reported this to Generals Sykes and Buchanan, who were together at the time, and I was directed by General Sykes to proceed at once to the advanced position which Captain Dryer had obtained (being within three hundred or four hundred yards of the enemy's batteries) and direct him to withdraw his troops immediately to the original position at the head of the bridge, and then to report in person to General Sykes. During my absence at the front, I believe, the note in question was received. When Dryer reported, those who were present know that the interview was in no wise a subject of consultation.

Had Captain Dryer been permitted to make the charge he was contemplating, his regiments, which we from our position could (but he could not) see, would have found, instead of a single battery, some eighteen guns covering their front, and he would never have been able to reach them; and he could never have returned, after an unsuccessful charge, because he was nearly a mile away from any support whatever. His men would have been annihilated by the concentrated fire that the enemy could have poured upon his small force. It was confidently believed, however, by the two brigades of regular infantry that if they had been thrown forward at any time towards the close of the day of the 17th, supported by Morell's division, they could have carried the center, and thus could have enabled General Burnside to drive the enemy from the field on the left.

*Wm. H. Powell,
Captain Fourth U. S. Infantry.*

BOISE BARRACKS, IDAHO, January 4, 1887.

"Life on the *Alabama*."

SINCE the February number of the magazine went to press we have learned, for the first time, from his own admission, that "P. D. Haywood," the author of the article "Life on the *Alabama* — By one of the Crew," which appeared in *THE CENTURY* for April, 1886, was not a seaman on the Confederate cruiser, though at the time the article was accepted he assured us he was, and furnished references which seemed to be satisfactory. He now claims that he had the incidents of his paper from a member of the *Alabama's* crew, but we are unable to attach any importance to that statement, and shall omit his article from the war papers when they are republished in book form.—
EDITOR.

The Rebel Yell.

THE thirsty rays of the July sun
Drank the breath of the summer morning
Over Utah fitfully blown
From ponderous mountain lips of stone
That seemed in grim prophetic warning
Curled in a vast and massive scorning,
As if the roar of the morning gun,
The faint far crackle of distant rifles,
Were part of a sum of mortal trifles.

Then woke Deseret's mountain men
At sound of an old familiar thunder,
Woke with a quick heart-leap, again,
Drew their brows in listening wonder,
With eyes of warriors gleaming under;
For these were the soldiers of the South
Drifted away on the wreck of battle
To this far mountain isle of drouth —
Listening now to the pulsing rattle
Of rifle volleys, while memory taxing
In half-awakening explanation,—
"Ha!" they said, their brows relaxing,
"This is the birthday of our Nation!
The common day of American glory!
How will the Mormon render the story?"

Then some from Stonewall's old brigade,
And some from the noted Hampton Legion,
And some from the Black Horse cavalcade,
And more from a far less famous region,—
The men that followed Old Pap Price
From early trials of Cow Skin Prairie
In and out of Missouri, twice,—
Followed their leader bold and wary
On to the final and sure disaster,
As men have never followed a master,
As men go anywhere, hand and glove,
Even to death, with the leader they love: —
These men questioning thus, and replying,
Looked from their cityward windows all,
Beheld the dome of the city hall
And the Stars and Stripes at *half-mast* flying!

As with one impulse, down to the street
From many a window disappearing,
Every obstacle leaping and clearing,
With old-time rush of the charging feet,
Toward the town-hall, they thundering hurried
Where Mormon chiefs sat flushed and hurried.
"Run up the flag!" the foremost cried
With voice like the roar of a joining battle.
"Up to the top!" And those at his side
Echoed his cry as the pattering rattle
Of a full brigade when it "orders arms";
Or a regiment firing a single volley.

The Mormons answered: "What wild folly,
Men of the South — and after the harms
That came to you from this striped rag,
Tainting you still with the smell of treason!
This is never your blue-crossed flag!
How flies your courage! How fails your reason!"
And then the soldier spokesman rose
As if he rose in a ringing stirrup,
Over the cowering heads of foes
The while his strong steed sprang at a chirrup:
"Not yet was it treason when *we* flew
To arms for a question vexed and nettled
From times of the Colonies on and through
To Appomattox — *but there it was settled.*"
Pausing, he knitted his grizzled brow,
And with a glance that seemed to sever
The hearts of the men at the lowered bunting
Whilst he for the strongest phrases hunting
Shouted: "To *us* it is treason NOW!
From Appomattox on and forever!
Run up *our* flag! We give you one minute,
Not to consider it, but to begin it!"

Then, when a dozen of shaking hands
Swiftly drew on the rising pulley,
Till, soaring up on its sea-grass strands,
The bright silk flag unfolding fully
Floated high in a sun-flood gleaming,
There sprang from hundreds of soldier throats
A shrill fierce cry like eagles screaming.
Out on the morning breeze it floats,
On, to the cabined sides of the mountains
Hushing the murmurs of winds and fountains:
Men leaped up wherever it fell,
Catching it up like a song forgotten,
Filled the air with the rebel yell,
The lost war-cry of the land of the cotton,
Till all the resonant fibers of pines
Every power of sound enlarging
Rang with the thrill of a shout that never
Sprang from aught but the terrible lines
Of the dauntless Gray-men fiercely charging,
Echoed it back from the mountain's brow
From tallest pines and stunted sages,
A shout that shall echo through future ages—
"To lower the flag is treason *now*,
"From Appomattox on and forever!"

TERRE HAUTE, IND.

H. W. Taylor.

In the Ranks at Fredericksburg.

GENERAL W. F. SMITH, in his article on "Franklin's Left Grand Division," makes mention of a "round shot that ripped open a soldier's knapsack and distributed his clothing and cards." It was not a round shot, but the second shot that came from the Whitworth gun that the "Johnnies" ran in on our flank. And although we were surprised and dumfounded at this attack from a new arm that appeared to take in about five miles of our line, the boys could not forego their little joke; so when that column of cards was thrown some twenty feet in the air, on all sides could be heard the cry, "Oh, deal me a hand!"

Three other shots in that battle did queer work. Ours was the last brigade (the "Iron Brigade") to cross on the pontoons, and we came to a halt upon the river bank, for a few moments, before going into position among the big cotton-wood trees at the Bernard House. We had been paid off that day, and the gamblers began to play at cards the moment we halted. A man who was about to "straddle" a "fifty-cent blind"

had his knapsack knocked from under him by a solid shot, and he "straddled" half a dozen soldiers, who were covered with a cart-load of dirt. This was the first shot from the "Johnnies" on our left. Their second shot passed over the river and struck a paymaster's tent. The struggle between that paymaster and the stragglers for possession of the flying greenbacks was both exciting and ridiculous.

The next day, December 13th, our officers and the enemy's batteries kept us on the jump. During a moment's halt, behind a slight rise of ground, we lay down. A soldier facing to the rear was in earnest conversation with a comrade. Suddenly he made a terrific leap in air, and from the spot of ground on which he had been sitting a solid shot scooped a wheelbarrow load of dirt. It was a clear case of premonition, for the man could give no reason for having jumped.

General Smith also speaks of "the Veterans' ridicule of the bounty men." The Twenty-fourth Michigan became part of our brigade shortly after Antietam, and we soon learned they were mostly bounty men. We made unmerciful sport of them, but never a word of joke or abuse did I hear after the Twenty-fourth had shown its mettle in this battle of which General Smith writes.

On the evening of December 14th, General Doubleday wanted our regiment (the Second Wisconsin) to go on picket and make an effort to stop the firing upon

the picket line, for the shots of the Confederates covered the whole field and no one could get any rest. We had not been in the picket line more than twenty minutes before we made a bargain with the "Rebs," and the firing ceased, and neither they nor ourselves pretended to keep under cover. But at daylight the Twenty-fourth Michigan came to relieve us. Before they were fairly in line they opened fire upon the Confederates without the warning we had agreed to give. We yelled lustily, but the rattle of musketry drowned the sound, and many a confiding enemy was hit. This irritated the Confederates, who opened a savage fire, and the Twenty-fourth Michigan (the bounty men) were put upon their good behavior; so it was with difficulty a general engagement was prevented. All that day, until about four o'clock, the picket-firing was intense, but was abruptly ended by a Confederate challenging a Sixth Wisconsin man to a fist encounter in the middle of the turnpike. The combatants got the attention of both picket lines, who declared the fight "a draw." They ended the matter with a coffee and tobacco trade and an agreement to do no more firing at picket lines, unless an advance was ordered. It was this agreement that enabled Lieutenant Rogers to save a long picket line that was to have been sacrificed when we fell back.

George E. Smith,

Late Private Co. E, Second Wisconsin Vols.

RACINE, WIS., Oct. 3, 1886.

TOPICS OF THE TIME.

The Voting Power of Ignorance.

ILLITERACY in the United States has been the subject of frequent newspaper and magazine articles since the Census of 1870 brought the matter into plain view. It has generally been treated, however, rather from the standpoint of national pride than from that of national danger; and when danger has been referred to, it has been rather the undefined danger of an ignorant vote than any specific risk. Further, there has always been a general feeling that the bulk of the illiteracy, after all, was among the negroes, and that time and hard work would alleviate most of the evils arising from an inevitable consequence of the Civil War.

That column of the Census reports which defines the illiteracy of white males of twenty-one years old and upwards, that is, of white voters, should be enough to destroy any complacency as to the future. Out of 11,343,005 white voters, 886,659, or 7.8% were unable to write. If we take this as the illiterate vote, and compare it with the pluralities and majorities in the Presidential election of 1884, a still more noteworthy result comes out to view. Thus, Cleveland's plurality in Connecticut was 1284, while the illiterate vote was 9501; Blaine's plurality in Massachusetts was 24,372, while the illiterate vote was 30,951; Cleveland's plurality in Kentucky was 34,839, while the illiterate vote was 54,956; Blaine's plurality in Illinois was 24,827, while the illiterate vote was 44,536. Thus one might go on through State after State, in which the illiterate vote was larger than the plurality which decided the electoral vote of the State, and, if united, might have

been the controlling factor in the election. It will be enough to give the general result; there are eighteen such States, and they cast 243 out of 369 electoral votes. So large is the possible field for the voting power of ignorance.

It is undoubtedly true, and it has been one of the advantages of universal suffrage, that this illiterate vote has been nullified to a certain extent hitherto by its division, and that the more intelligent vote, which changes on occasion from one side to the other, has been a percentage large enough to decide elections. Nevertheless, there must be a constant pressure, as the steady descent of parties shows, to deal tenderly with the prejudices of the ignorant vote. The pressure is not so strong as it would be if the ignorant vote were united into a party, holding the balance of power in eighteen States, with 243 electoral votes; but it is strong enough to exert a steady influence toward the degradation of parties and party politics. Massachusetts tries, and fails in practice, to disfranchise those who cannot read and write, just as Connecticut fails to disfranchise those who have not a good moral character.

The ignorant vote, being the residuum of universal suffrage, is the most helpless element of a democracy. It is the first to be bought up, the first to be deceived, the first to be assailed by any form of coercion or terror. Election laws, and every variety of protection for the ballot, have been primarily compelled by the existence of this class, and are designed for its protection. It is a necessity for a democracy to see to it that vote-buying is prevented; otherwise the power of money might consolidate this ignorant vote into an instrument of dangerous, perhaps fatal, effect. The

case has been exactly parallel with all the forms of coercion which have thus far come to the surface; the State has attacked them in self-defense, in order to prevent them from consolidating the ignorant vote into a dangerous power. It is regrettable that the efforts of the State have failed so often; but it must be admitted that they have at least served their principal purpose until now, for the ignorant vote has not yet assumed the place of a balance of power.

Boycotting, in one or another of its shades and varieties, promises to change all this. Of what avail is it that the law has forbidden the purchase of votes, when the pressure of sheer terror is so much cheaper and more effective? Why should one pay two dollars for a vote, when the threat of a boycott will give him a hundred votes at a time? The threat is enough; for the more ignorant, the more helpless the voter, the more effective is the new political force. The man who is unable to write his own name may yet be too conscientious to sell his vote. Threaten him with loss of work, and he is far less able to resist the pressure than the more highly educated voter: it is impossible that he should not yield. Such cases are not new. They were bad enough when an employer or corporation used this threat to coerce employees into voting as they did not wish to vote; but such a coercing power must of necessity do its work more or less imperfectly. It must use agents; and no agents will work perfectly. It must contend with the possibilities of the secret ballot. It must feel some fear of the force of public opinion. But the labor organization is a far more effective force than any individual or corporate employer, for it is under no such restrictions. Its watchers are its own members, all eager to prove their own usefulness and loyalty by the detection of traitors. It is Argus-eyed as well as merciless. Above all, it is almost freed from consideration for public opinion, for it is governed by a public opinion of its own. The weaker classes of voters are helpless when its full power assails them. Its little finger is more powerful in its effects on the ballot than the loins of the individual or corporate employer.

We have, and are likely to have, two great political parties in this country. If the new system is to be allowed its natural effect, both parties must bid for the support of the new power; right or wrong, neither can afford to let its opponent have the controlling vote in so many States, with so large a portion of the electoral vote. The party which secures success through this ally in one election must do so by large concessions to its ally's demands; and the defeated party, in its bids for future assistance, must inevitably raise the market value of the new political factor. Nor will it be possible to restrict the coercive force of the boycott to labor organizations in politics, and to give them a monopoly of the punishment of political "scabs": equality of privilege in respect to this must be a claim of every political organization, and each will exercise the privilege to just the extent that its opportunities enable it to go. Degradation of political purposes is bad; but degradation of political methods is in many points even worse, and is more fatal in a democracy. The former can be met by argument, by instruction, by influence; to the latter there is no answer, in the last resort, but money or force. And when both of these two evil remedies have failed, the "Savior of Society" enters.

So far as State elections are concerned, the remedy must be left to the States; and Presidential elections are legally no more than State elections. Congressional elections are a different matter; it is here that the evil would have its clearest field, and it is here that the application of the remedy is easiest, though it is not yet a familiar idea. Congress is empowered to make rules and regulations for "the time, place and manner" of choosing Representatives and to alter the rules and regulations which any of the States may have made. English political thinkers are studying American methods in order to find a way out of their difficulties: is it not wise for us to borrow a leaf out of English experience in the conduct of our elections? Parliament has not found it difficult to prescribe by statute the manner of nomination, to enforce a limit to the amount of money to be spent at the election, to furnish ballots at public expense, and to provide rooms where the voter may prepare his ballot for deposit, without the possibility of the knowledge or interference of any other person. All these safeguards, the latter being particularly important as excluding all forms of boycotting, are quite certainly included under the "manner" of elections for Representatives, for which Congress is empowered to make rules and regulations. All that is necessary is that an Act of Congress shall apply to these elections the safeguards which have been evolved by similar experiences across the water.

If our Congress were a wise political body, with proper methods of procedure, its first step would be the application of something like the English system to our elections for Representatives. We can only hope that our rulers may have the foresight, in spite of their limitations, to begin the work at once, even though it should involve leaving the decision of disputed election cases to the courts, instead of resting them on the decision of a partisan majority in the House. But it is much to be feared that Congress will, as usual, do nothing until the mischief has been done, and then it will be too late.

The New North.

PROFESSOR TILLET of Nashville, in his article in the present *CENTURY* on "The White Man of the New South" takes a new view of an old subject, but a view so similar to that of Mr. Grady of Atlanta in his recent speech before the New England Society of New York that it may be as well to state that Professor Tillett's paper was in our possession some time before the delivery of Mr. Grady's address. In fact, this phase of Southern opinion is not unfamiliar to the readers of *THE CENTURY* ever since the publication (in 1873 and onward) of Mr. Edward King's Great South series of illustrated articles.

The eloquence of Mr. Grady still reverberates throughout the country. The brilliant young journalist turned a pleasant social occasion into a national event. The scene was indeed a notable one. Near President Russell on one side sat the Union conqueror of Georgia, on the other stood the young orator from Georgia—the first representative of the South to address the Society since the close of the civil war. Mr. Grady had just that sense of anxiety and that necessity for daring which gives the orator his opportunity for failure or for distinguished success. In his manly statement of the

present relations of the two sections, as he conceives them to be, he staked his standing at home upon the intelligence and patriotism of his own people; and he threw himself fearlessly at the same time upon the generosity and good faith of an untried Northern audience, an audience of hereditary adherents to ideas once the most inimical to those of his own section. The enthusiastic reception of his sentiments by his Northern audience and the warm indorsement of them by his Southern fellow-citizens prove that he made no mistake in either direction.

When Mr. Grady heard the New England Society cheering his allusions to the Cavalier, and to the beaten but not crushed or disheartened Confederate soldier who turned his charger into a plow-horse and went to work to create a prosperity more firm and desirable than that which was based upon human slavery, and when he heard from Delmonico's gallery the familiar and inspiring strains of "Dixie," his surprise at the New North may have been quite as great as that of any of his audience at the New South pictured in his own fervent and patriotic oratory.

One of the most striking points in Mr. Grady's speech was his tribute to Lincoln—a tribute which, as coming from a Southerner, could surprise no one who has watched the growth of the national feeling of late in our Southern States. Rather for its typical value as the expression of a rapidly growing sentiment, than as an exceptional and individual view, we reprint it here:

"Great types, like valuable plants, are slow to flower and fruit. But from the union of these colonists, from the straightening of their purposes and the crossing of their blood, slow perfecting through a century, came he who stands as the first typical American, the first who comprehended within himself all the strength and gentleness, all the majesty and grace of this Republic—Abraham Lincoln. He was the sum of Puritan and Cavalier, for in his ardent nature were fused the virtues of both, and in the depths of his great soul the faults of both were lost. He was greater than Puritan, greater than Cavalier, in that he was American, and that in his homely form were first gathered the vast and thrilling forces of this ideal government, charging it with such tremendous meaning and so elevating it above human suffering that martyrdom, though infamously aimed, came as a fitting crown to a life consecrated from its cradle to human liberty. Let us, each cherishing his traditions and honoring his fathers, build with reverent hands to the type of this simple but sublime life, in which all types are honored, and in the common glory we shall win as Americans there will be plenty and to spare for your forefathers and for mine."

The Shop-Council.

WHO can estimate the evil influence of secrecy on the labor difficulties? The employer is trained to secrecy as he is trained to business. He must learn to keep the conduct of his business in his own hands and head, to guard his trade secrets, to confine each employee's knowledge to his own department, and general knowledge to partners; to "let things out" is to tempt bankruptcy. The trades-union is, in its turn, as secretive as the employer, for it feels that secrecy is essential to the successful struggle which is to prove

its reason for existence. In its secret debates, petty grievances are swollen into unnatural proportions through the desire to maintain the "dignity of labor" by showing that "an injury to one is the concern of all." On both sides that first blow which is to be half the battle is to come like a thunder-clap from a cloud of secrecy.

Two men, taking such an attitude toward each other, would not be far from a conflict; the first motion, perhaps unconscious or instinctive, by one would be met by more effective movement by the other. The present attitude of employer and employee toward each other is too often that of the frontier ethics of the Far West, where a well-furnished pistol-pocket and the ability to "draw" most promptly are the supreme tests of the better man; and where, consequently, the first motion toward the pistol-pocket is the signal for decisive action by the other. Could the employee get into the secrets of the employer, he might be surprised to find that the supposed millionaire was really "shinning" around the street in the desperate effort to make one note take the place of another; and that an attack upon him at the juncture, resulting in suspension of work, would be suicide rather than victory. Could the employer get at the secrets of his employee, he might be surprised to find that the supposed loud-mouthed demagogue was really borne down by a double burden of anxiety for his family, by fear of the direct consequences of a strike or lock-out and of the indirect consequences of any apparent treachery to "the cause of labor" on his part. Could the two parties know each other better, how many struggles would be averted, and how many others would never rise to the dignity of a strike or lock-out.

Mr. James C. Bayles, the editor of "The Iron Age," has suggested in a pamphlet the institution of "shop-councils," in which employer and employee are to be equally represented—the decisions not to be binding on either party unless approved by both, and all functions to be purely conciliatory. As a means of eliminating something of the element of secrecy from the relations of the two parties, of keeping petty matters out of secret discussion and decision, it seems all that can be desired. It is the antipode of compulsory arbitration; and it avoids that suspicion which often attaches even to voluntary arbitration. It is rather symptomatic than remedial, just as a general disuse of the pistol-pocket would be an excellent accessory to a law against street-combats. It is a modest proposition; but, even in the din of high-sounding schemes and associations, is it too much to hope for a fair trial of it somewhere?

Art in Our Coinage.

IT must indeed remain a dream, as Mr. Stillman expresses it, that modern coinage can ever become, like that of ancient Hellas, a chief vehicle of the expression of art. It is not, however, too much to hope that it may come at least to reflect the contemporaneous attainment of art. Greek medalists were untrammelled by the requirements of regularity of contour, and thickness, and excessive flatness of relief, which are in this practical age demanded in money for the greater convenience of its use as a medium of exchange. Our

power-presses, too, are, in truth, necessary to secure swiftness and economy of manufacture; but they can never produce the artistic effect of the blow struck by the hammer of the ancient coiner, deftly modulated and directed, as it always was by experienced workmen, so as to bring out the full value of any particular die. Moreover, perhaps we cannot expect the designer of to-day, whose mind is free from all mist of mythological illusion, to work with quite the inspiration of Evainetos and Kimon and their great unknown brother-artists. But after every allowance has been made, the fact remains that, with a few exceptions, the coinage of the modern world is unnecessarily inartistic. And none will gainsay Mr. Stillman that, among all, the products of the United States mint are the most barbarous—the most contemptible in the weakly grotesque design of their eagles, in their ill-drawn and commonplace Liberties, and in the vulgarly staring lettering of their legends.

Modern coinage must, of course, always conform to modern conditions of evenness and regularity. But living art—and to see that art is not yet dead, we need look no further than to the work of French sculptors and to that of some that we have among ourselves—makes light of such restrictions. The Parthenon frieze proclaims for all time what can be done within fixed lines and in the extreme of low relief. It rests simply with the Treasury Department to consign to oblivion when it will our gawky fowls and disjointed goddesses, and to set an example to the world by the issue of a series of coins bearing for each denomination independent designs—the most meritorious attainable. Such series, renewed at fitting intervals and presenting, within the possible range, the best contemporary conceptions of personified civic virtues and the best portraits of our great men, would surely exert a potent educating influence upon the eyes and thought of our people, and would emulate, even if from afar, the interest of ancient coinages as an enduring record of history and art. The Administration which is the first to adopt this reform will win for itself high and deserved honor, and will at the same time give to the medalist's art an impetus greater than it has enjoyed since the day of its generous patrons of the Renaissance.

A Breach in the Chinese Wall.

THERE is a provision in our tariff law concerning which it would seem that all educated Americans should be of one mind. We refer to the duty of thirty per cent. imposed on the works of foreign artists. An opportune occasion for bringing this subject once more to public attention is afforded by the recent gratifying Treasury decision secured by Mr. Henry G. Marquand, followed by the judgment of the United States Circuit Court in favor of Mr. H. H. Arnot,

that pictures painted before 1700 are entitled to admission free of duty, as "antiquities." It is humiliating to American pride that such a question could ever have been raised. But the Treasury Department must execute the laws as it finds them; and we should be grateful that its interpretation of the law is liberal-minded, and grateful above all to Mr. Marquand for the service which he has rendered to American culture and American reputation by establishing the fact that the masterpieces of Renaissance art, to obtain which all other nations will make almost any sacrifice, will not, at least when the rare opportunities to secure them come, be kept from landing here by our custom-house. But, though the splendor of the names of many of the old masters renders their case, now happily decided, the more conspicuous,—that of living foreign painters and sculptors whose productions are still subject to our almost prohibitive duty, should, for obvious reasons, concern us hardly less. The great majority and best of our native artists protest against this art tax. The most materialistic of them know well that, in this case, "protection" cannot "protect." The duty may prevent the connoisseur from buying the foreign picture which he fancies, but it cannot make him buy any native picture which he does not fancy—as he might buy a home-made hat or umbrella. He will have in art what he likes or nothing. Again, the artist knows that the more good pictures and statues the public sees, the more its taste for such things grows, and the wider becomes his market—not to speak of the advantage to himself of having in this country as many as possible of the works of genius which, otherwise, he must, to perfect himself, go abroad to study.

And here, again, is a consideration which for the very shame of it should impel Congress without delay to set art free. Scores of Americans go to Europe yearly to improve themselves in their high gift. To these young men and women, rich generally only in talent and in hope, the doors of the great French national schools are open wide; the *ateliers* of world-famous masters extend their welcome; the hospitable museums and galleries of Italy offer without stint their priceless treasures. Yet if the teachers to whom these Americans owe much of the success which life may give them desire to send here their own beautiful creations, they are stopped by a customs officer! Could a nation claiming to be enlightened place itself in a position more ignoble?

Our artists, as a class, have done what they could to protest against the tariff on art; our President has more than once recommended officially the repeal of this duty. Let Protectionists and Free-Traders join hands for once in Congress, and prove to the rest of the world that the American Republic has attained, even if tardily, a civilization advanced enough to rank works of art, æsthetically and practically, upon a higher plane than whisky and pig-iron.

OPEN LETTERS.

Lincoln's Ancestors in Virginia.

THIS brief notice of the ancestors of Lincoln who lived in Virginia is designed to throw, if possible, some additional light upon the history of the fathers of that great man, and perhaps correct some errors of fact growing out of the unsettled — almost illiterate — condition of affairs during the period of time involved.

That the early ancestors of Lincoln lived in Berks county, Pennsylvania, and moved thence to Virginia, as Messrs. Nicolay and Hay state, there is no reason to doubt. It is confirmed by the statements of the President himself. It may be accepted, too, as correct that the great-grandfather of Lincoln, whose name was John Lincoln, lived in that county and State and emigrated from there to Virginia. The precise date of his settlement in Virginia has not as yet been definitely ascertained.

It is true, as stated in *THE CENTURY*, that the records belonging to the Lincoln family during their residence in Rockingham county, Virginia, were destroyed by the Federal army during the civil war, but fortunately there are yet in existence certain official and indisputably authenticated documents, only discovered upon a recent search, which the torch of war did not touch and which disclose some interesting information on these subjects. In the year 1768 that portion of the Shenandoah Valley, Virginia, now contained within the county of Rockingham constituted a part of the county of Augusta, from which county Rockingham was detached and organized in 1777. Prior to this date — 1777 — all transfers of real estate in the country now comprising Rockingham county were recorded in the clerk's office of Augusta county at Staunton, the county seat. The records of this office disclose the fact that on the 16th day of August, 1768, there was recorded a deed from the heirs of Robert McKay to John Lincoln, conveying a tract of six hundred acres situate on Linvill's Creek in the county of Augusta, now in the county of Rockingham. This tract of six hundred acres was a portion of a very extensive body of land patented to McKay and others as early as 1739, and was doubtless regarded then, as it unquestionably is now, as among the finest tracts of land in the fertile Shenandoah Valley. The consideration that passed from John Lincoln to McKay's heirs as set forth in the deed is merely a nominal one, "the sum of five shillings, current money of Virginia." In view of this purchase of land in Virginia by John Lincoln, it may certainly be regarded as settled that he — the great-grandfather of the President — located in what now constitutes Rockingham county, Virginia, as early as 1768.

Messrs. Nicolay and Hay intimate in the Lincoln history, and Mr. Nicolay states in his article on Lincoln in the "Encyclopædia Britannica," that Abra-

ham, Isaac, Jacob, Thomas, and John, sons of John Lincoln, were born in Virginia. Unless it can be shown that John Lincoln located in Virginia a considerable time prior to the year 1768, it may be fairly assumed that his sons just named were all born in Pennsylvania and accompanied their father to Virginia upon his settlement in that State. This idea receives corroboration from certain conveyances to his sons made by John Lincoln. On the 11th of August, 1773, only five years after the date of the conveyance from the McKays to John Lincoln, he with his wife, "Rebeckah R.," transferred to their son Isaac two hundred and fifteen acres of the original six-hundred-acre tract, and on the 17th day of August, 1773, they also conveyed to their son Abraham — the grandfather of the President — two hundred and ten acres of this same tract, each conveyance being made for a nominal consideration only, — "five shillings current money of Virginia." * It may be noted that the elder John Lincoln, as well as his sons, all spelt and wrote their name "Lincoln," and in no instance do these documents disclose any other method of spelling.

At what time did Abraham Lincoln, the grandfather of the President, remove from Virginia to Kentucky? Messrs. Nicolay and Hay fix the date as 1780. The date of the land warrants to Abraham Lincoln, the 4th of March, 1780, and the subsequent entries of the land in Kentucky thereunder certainly confirm the time of his leaving Virginia as being as early as 1780, but the statement by Messrs. Nicolay and Hay "that he took his wife and five children with him" at this time is not borne out by record evidence in Rockingham county. There is still in existence the original deed from Abraham Lincoln and Bersheba, † his wife, to one Michael Shanks, dated the 18th of February, 1780, whereby, "in consideration of the sum of five thousand pounds current money of Virginia in hand paid," they granted and conveyed to Shanks a tract of two hundred and fifty acres, consisting of the two hundred acres received from John Lincoln, his father, and another tract of about forty acres obtained from one Munsey. There can scarcely be any reasonable doubt that this was the sale of Abraham Lincoln's real estate preparatory to his emigration to Kentucky. The deed was recorded on the 17th of June, 1780, but without the privy examination of "Bersheba," his wife, attached to the transfer. Consequently, in order to remedy this defect in the conveyance, there was issued on the 8th of September, 1781, by the county court of Rockingham, a commission of privy examination of his wife "Bersheba," "she being unable to travel to our said county court of Rockingham to be privily examined apart from her husband whether she is willing to relinquish her right of dower in the land in the said deed mentioned, as the law in that case directs." This commission was executed by the commissioners named therein

* The rest of the original six hundred acres remained vested in John Lincoln until the date of his death in 1792, when it was conveyed by his executor to his son Jacob Lincoln. The executor's deed as well as the will of John Lincoln

were destroyed during the war by the burning of the records of the county.

† It appears from these documents that Lincoln's great-grandmother was named "Rebeckah" and his grandmother "Bersheba."

SIGNATURES OF THE GRANDPARENTS OF PRESIDENT LINCOLN.

on the 24th of September, 1781, returned to the county court, and recorded the same day; and the acknowledgment of "Bersheba Lincoln," grandmother of Abraham Lincoln, that she "had signed the said deed of her own free will, without any threats, force, or compulsion of her said husband, was complete," and with it, doubtless, passed all remaining material interest of the President's grandparents in Virginia. Lincoln himself states that his grandfather settled in Kentucky about 1782, and this privy examination certainly shows that his grandmother was still in Virginia as late as September 24, 1781.

If Abraham Lincoln the pioneer removed to Kentucky prior to this date — September, 1781 — his wife did not accompany him, and it may be reasonably supposed, considering the difficulties and dangers attending travel at that time, that his wife and children did not migrate until the spring following. Nor is it improbable that Abraham Lincoln, having already visited Kentucky on a prospecting trip, and selected his new home, returned to Virginia to carry back with him his wife and children.

John T. Harris, Jr.

HARRISONBURG, VIRGINIA.

The following letters from Lincoln on the subject of his family, which Mr. Lamont refers to in his life of Lincoln as having been destroyed during the war, have been since discovered, and for the first time are given to the public. They are addressed to David Lincoln, the son of Jacob Lincoln, a brother of Lincoln's grandfather, who remained in Virginia, and the originals are now owned and highly prized by Abraham Lincoln, a son of David Lincoln, a much-respected citizen of Rockingham county, Virginia, to whose courtesy we are indebted for their publication.

J. T. H., Jr.

WASHINGTON, March 24, 1848.

MR. DAVID LINCOLN.

DEAR SIR: Your very worthy representative, Governor McDowell, has given me your name and address, and as my father was born in Rockingham, from whence his father, Abraham Lincoln, emigrated to Kentucky about the year 1782, I have concluded to address you to ascertain whether we are not of the same family. I shall be much obliged, if you will write me, telling me whether you, in any way, know anything of my grandfather, what relation you are to him, and so on. Also if you know where your family came from, when they settled in Virginia, tracing them back as far as your knowledge extends.

Very respectfully,

A. LINCOLN.

WASHINGTON, April 2, 1848.

DEAR SIR: Last evening I was much gratified by receiving and reading your letter of the 30th of March. There is no longer any doubt that your uncle Abraham and my grandfather was the same man. His family did reside in Washington county, Kentucky, just as you say you found them in 1801 or 2. The oldest son, Uncle Mordecai, near twenty years ago removed from Kentucky to Hancock county, Illinois, where, within a year or two afterwards, he died, and where his surviving children now live. His two sons there now are Abraham

and Mordecai; and their post-office is "La Harp." Uncle Josiah, farther back than my recollection, went from Kentucky to Blue River in Indiana. I have not heard from him in a great many years, and whether he is still living I cannot say. My recollection of what I have heard is, that he has several daughters and only one son — Thomas. Their post-office is Corydon, Harrison county, Indiana.

My father, Thomas, is still living, in Coles county, Illinois, being in the seventy-first year of his age. His post-office is Charleston, Coles county, Illinois. I am his only child. I am now in my fortieth year; and I live in Springfield, Sangamon county, Illinois. This is the outline of my grandfather's family in the West.

I think my father has told me that grandfather had four brothers, Isaac, Jacob, John, and Thomas. Is that correct? and which of them was your father? Are any of them alive? I am quite sure that Isaac resided on Wataga, near a point where Virginia and Tennessee join; and that he has been dead more than twenty, perhaps thirty, years. Also, that Thomas removed to Kentucky, near Lexington, where he died a good while ago.

What was your grandfather's Christian name? Was he, or not, a Quaker? About what time did he emigrate from Berks county, Pa., to Virginia? Do you know anything of your family (or rather, I may now say, *our* family) farther back than your grandfather?

If it be not too much trouble to you, I shall be much pleased to hear from you again. Be assured I will call on you, should anything ever bring me near you. I shall give your respects to Governor McDowell, as you desire.

Very truly yours,

A. LINCOLN.

[Since the November number of *THE CENTURY* was printed, Messrs. Nicolay and Hay have become possessed of information which goes to show that John Lincoln, the President's great-grandfather, sold his property in Pennsylvania in 1748, and moved to Virginia about 1750.—EDITOR.]

Notes on Village Improvement.

THE first step in village improvement should be to promote its healthfulness. It is a very poor sort of improvement which occupies itself with laying out walks and smoothing door-yards and lawns, and planting trees and preparing flower-beds, while it leaves the air around the dwellings to be polluted by the noxious effluvia arising from a neighboring drain or from foul substances left upon the surface of the ground for lack of any proper provision for their disposal, or which leaves households to depend for the water which they use upon wells situated so near to barn-yards or cess-pools that they may be contaminated by them. It is a cleansing of the outside of the cup and platter, while within it may be full of all uncleanness.

A committee should be appointed, composed of energetic and capable persons who shall examine the entire village or town district, to see where the laws of health are infringed, and then to institute the proper correctives and safeguards, remembering that what endangers the health and life of one household threatens to some extent the health and life of the whole community. Having attended to what lies deeper than the surface, health and life itself, heed may then properly be given to those

things which are upon the surface, such as streets, walks, trees, lawns, the disposal of grounds, and a hundred other things of more or less importance.

Village improvement is sometimes village misimprovement. The first impulse of many organizations for the former purpose is to straighten streets, to level elevations, to plant in rigid lines, to cut everything after a geometrical pattern, to make the architecture of buildings follow, so far as possible, one model, and this they call improvement. When their taste has become further developed, it begins to dawn upon them that in proportion as they have made their paths straight they have lost the peculiar charm of the village without gaining the advantages of the town.

Many of our villages are threaded by sparkling streams which necessitate bridges for their passage; but this is no reason why these bridges should be the positive disfigurements of the landscape which they so often are.

In regard to the planting of trees in village streets much might be said. This is, probably, one of the first things thought of and undertaken by Village Improvement Societies. This is well. And perhaps it may be said that every tree thus planted is a positive gain both in regard to appearance and comfort. But there is often so little care taken in planting trees or in their subsequent management, that we get many sickly and imperfect specimens where we should have noble and stately growths. Here it is emphatically true that what is worth doing at all is worth doing well. Then we make the mistake of limiting ourselves to a very few species of trees, when we have an almost countless variety from which to choose. No other country is so rich in the variety and beauty of its trees as ours. Yet we have restricted ourselves in street-planting for the most part to the elms and maples. Why should we not make use of the ash, the birches, the beech, the basswood or linden, the locust, the chestnut, the hickory, the sycamore, the magnificent tulip-tree, the cypress, the larch, with the cedars and other evergreens, not to speak of the many other trees by a wise selection from which we may secure endlessly varied effects of form and color?

In planting about our dwellings, care should be taken not to plant many trees, nor so near our houses as to overshadow them or prevent light and air from having free access to them. Trees are good and greatly to be desired, but we must not allow them to shut away from us the sunlight. The fountain of light is also the fountain of life. Sunshine is absolutely essential to healthy life and growth, whether animal or vegetable. Bright green turf with a few low-growing trees or shrubs are better near a dwelling than a growth of forest trees.

N. H. Egleston.

Young Men and the War Issues.

THE growing disposition on the part of political orators and on the part of the press to be careful not to give offense in their references to the war partly explains why so liberal and patriotic a feeling is gradually spreading. One reason why politicians have changed their course, outside of the result of the many essays, etc., calling for a burial of dead issues, is the fact that each succeeding year brings to the front a host of young men who

for the first time take up the mantle of citizenship. They are young men who have never known a divided country, whose only knowledge of the war is gained from history; who have never known and can never appreciate (unless they experience them later) the deep passions that could sever even the ties of blood, and place brother against brother, father against son, on the dreaded battle-field. These young men in studying history read of Washington and his band, and the spirit that actuated them, before they reached the story of the Civil War. The story of the original struggle for independence is just as fresh to them as is the incomplete narrative of the Civil War. When they turned the first page of history they found the States a Union, and when they reached the last page they found that Union still intact. These young men know only one country, without sections; they are looking forward, not back; they demand that the "bloody shirt" and all it once covered shall be buried, and that at once, or they will renounce the party that waves it as an enemy of its country. Political leaders realize this, and in catering to the young vote, which though still in the minority will soon be the majority, are obliged to resort to new themes, and abandon the planks that have served them so long at the country's expense. The men whose passionate fires of sectional hate will only be extinguished by death itself will soon be in a hopeless minority, if they are not so already, and the story that has fanned the flame in their hearts for so long will not suffice for coming voters, North or South; and consequently, is it not reasonable to expect that with the absence of the so-called issues from their accustomed places the spirit that seems to exist, slight though it may be, in consequence of their presence, will soon entirely die out? The social evils of the South arising from the unsettled state of the country at the close of the war and from the process of reconstruction we have ample evidences are fast giving way before the earnest appeals of gifted writers, and to them let all credit be given. But give to the young men of the country, North and South, credit for forcing from our politics many, and soon all, of the issues arising from the war.

A Young Voter.

The Poetic Outlook in America.

THERE seems to be a wider diffusion of the literary art in America than of any other. The number of good if not of great story-writers yearly increases, and so does the number of writers of good if not of great poetry. When Heaven gives us our next great poet, we may be slow to recognize his Pegasus, and will probably waste no little time in looking the gift-horse in the mouth. With so much good poetry being written all the time, the great poet runs, perhaps, more danger than ever of being snugly tucked into his last bed before the day of his "recognition."

Until a poet has become a convention the official critic will surely misprize him. Keats while alive forms no part of England's conventional literary glory. A reviewer, unless through personal acquaintance or some such chance, would not think of mentioning the living Keats as a name belonging to the roll of England's greatest men. The poor boy dies; Shelley and others take up his memory; generations of com

parison and appreciation do their work, and then, "the great poets of that time were Wordsworth, Byron, Shelley, Keats; — when will England again possess such a galaxy!" The despal of the living goes on, till one day, thanks to longevity, the living Browning and Tennyson are fully acknowledged. We look backward or forward for the great novelist, poet, artist,—he who dares to find contemporary greatness is regarded as partisan or fool. And yet just fame has not always waited upon dissolution, and a little overrating of the living is less dangerous than the cynical tone which discourages and robs of the necessary opportunity.

We are no friends of indiscriminate adulation and misplaced encouragement. But think for a moment of the deadening indifference which in these days the poet has to overcome. The modern rush for gold is remorseless; drawn on with it are many minds who think themselves outside the pressure. The poetical mood and accomplishment are apt to be looked upon in modern society as an impertinence or a weakness. Plastic art, though often ill rewarded, is fashionable in at least some of its forms; but poetry — we mean the essential thing, not the pretty printed books which contain it — will not decorate a wall; therefore the æsthetic discussions of our day turn largely on the relative merits of etchings, rugs, or vases, on the latest prize picture or newest statue, but much more rarely on the merits of the latest poem. The only form of literary art which society cares to discuss is the novel. We do not begrudge the novel the attention it attracts; we merely note the fact that while poetry is praised as perhaps the highest form of art, its serious votary is very apt to be regarded by the world at large, just so far as he is able to be entirely faithful to his calling and ideal,—giving up everything else for that one thing,—as a being of inferior character and intelligence.

We blame the world at large for its indifference; but what example is set in this regard by those who really are lovers of poetry and sincere devotees of the beautiful?

Are these last alert for the evidences of literary talent among the men and women of their own day? In fiction, yes; but we are pleading now for poetry. Are we not, all of us, the public and the literary classes as well, apt to be indifferent, ungrateful, cynical? The "genius," when he comes, you say, will need no coddling. But have we no duties? no desire to be "right on the record"? Is it not too much to expect that a poet should be forever "mouthing toward the waste"? Joseph Jefferson says that an actor actually gets some real emanation from an audience which enables him to sustain the nervous strain of acting. Is it not so with every artist? Do we want to be among those who let slip out of the world a Keats and a Lanier, without the meed of appreciation to which they were most justly entitled?

To our thinking the poetic outlook in America is encouraging. There are scores of men and women who are capable of writing now and then poems far above the average. Almost too many, indeed, write verses well,—too many only because attention is thus distracted from the lesser number who are destined to pursue the art to the furthest limit of their capacity. We do not speak now merely of those who have published books and attained reputations within a short

time past, such as Edith Thomas, Egan, Thompson, Riley, Sill, Bunner, Miss Hutchinson, Miss Cone, Abbey, Boyle O'Reilly, Lathrop, Miss Bates, Fawcett, Miss Lazarus, DeKay, Miss Guiney, Arlo Bates, but of still others who have not yet printed a single volume. Magazine readers have had the opportunity of becoming familiar with the lyrics of John Vance Cheney which have lately passed into a more serious tone; with the deeply imaginative and growingly artistic verses of Robert Burns Wilson; with the sonnets of W. P. Foster, which for grandeur of thought and language compare not disastrously with the best written in this century; with the musical and often profound note of James T. McKay. All that we have named—and it would not be difficult to extend the catalogue—(Montgomery, Henderson, Tooker, Sherman, etc.) are poem-writers of proved capacity. Some of them assuredly have "the makings" of as genuine poets as America has yet produced; whether they will attain to the height of their hopes and capabilities rests largely with their own consciences, but partly depends also upon their opportunities and the sympathy they shall receive from their fellow-countrymen,—from their contemporaries rather than from posterity.

We are confirmed in our opinion as to the wide distribution of poetic capacity in America by the large number of poetic books recently published, and by the excellence of much of the work. To one who for the first time should meet with the poems of their respective authors, in the latest volumes recently issued, bearing the names of Julia C. R. Dorr, Elizabeth Akers, Celia Thaxter, Mary Bradley, Margaret J. Preston, Nora Perry, and H. H., we can imagine how strong would be the general impression of lyrical ability, propriety of diction, and dignity and sincerity of thought,—with here and there a note of startling intensity and beauty. Each volume would, of course, show a separate individuality,—traits that we need not dwell upon here, so well are they known to students of recent American literature. In the books just mentioned, how little is there of triviality,—how just and pure is the view of life; how much there is of freshly told, homely human experience; how much of spirituality. The unforgettable "Birthday" poem of Mrs. Akers on the dead child who still grows yearly by its mother's side; the late H. H.'s calm, heroic outlook into eternity,—such poems as these lift themselves from a level which is far from being uniformly commonplace.

In a volume as unpretending as Henry Abbey's "Poems" (containing all his works), where one may not always, though he will sometimes, be interested in the versified story, one comes upon such a notable piece of mixed sentiment and description as "Recompense," and such a perfect lyric as "Donald"; while in a first book, half prose, half verse, "The Saunterer," by Charles Goodrich Whiting, the reader finds, here and there, a vigorous and imaginative lyric, like that on "The Eagle's Fall," and as tender a lament as that "For Ronald in his Grave." Whoever reads "The Saunterer," let him not omit "The Girls of Bethany," "Summer Thefts," "Home," "What More"—poems as true in feeling as in form.

Among other recent first books of poetry is James Herbert Morse's "Summer Haven Songs," a title singularly descriptive of the subject and tone of the collection: here we find the reflection, as in a country

brook, of a refined, scholarly, cheerful, nature-loving mind. Another first book, with an accurately descriptive title, is Margaret Deland's "The Old Garden," a book to which the generally misapplied term of "quaint" may fitly and with praise be applied. Like the old shawls in the poet's attic, there is here

"The scent of cedern chest . . .
And ling'ring sweetness of dried lavender,
Or pale pressed rose-leaves."

If this were a review of all the recent American books of poetry which deserve attention, something should be said of the lighter touch, often most happily successful, of Clinton Scollard, Oscar Fay Adams, and Samuel Minturn Peck. But without further reference to these, or anything more than a reference to the latest volumes of the veteran Whittier and the younger veteran Cranch, we prefer to close this sketch with especial mention of two anonymous books of verse which have recently appeared, so far as we are aware, with little or no heralding. The author of "The Heart of the Weed" writes sonnets that are not dull: that itself is something; but to write sonnets so genuine in feeling and with such firmness and purity of expression, that tell the impersonal story of a woman's heart so freshly, so poetically,—this is to make a real addition to the literature of the emotions. (Read "Grief," "I'd Give Release," "A Prisoned Bird," "Song," p. 34, "I give Thee Naught," "A Year," "Return," "To —," p. 56.) Entirely different, more imitative, more immature in its grasp of life, but with a marvelous lyrical sense and at times an astounding imagination and passion, is the poetry of the anonymous

author of "Sylvian and other Poems." Surely the author, among the "other poems," of "To One having a Talent for Music," "Love Unspoken," "Written at the End of a Book," and "Mary, the Mother, sits on a Hill," has already done enough to win the gratitude of all who have the *flair* for the real thing in poetry. But the chief interest in "John Philip Varley" (the name that goes with "Sylvian") is his promise. If we may assume that the author is young, then all his volatility and imitativeness may be forgiven, for the virility and music of his verse.

We have not attempted to criticise, but rather to furnish data in proof of the statement as to the present extraordinary diffusion of the poetic talent in this country.

Many books of verse issue from the press in which there is scarce a notable stanza from cover to cover. But though all the writers noted here are by no means on a plane of ability, though some of the collections mentioned are extremely unequal in quality, we have named not a single writer whose work does not somewhere show an artistic sense. It is not, of course, necessary that poetry should be great in order to be good; there is, we hold, a vast amount of good at this time. How much, if any, of current verse is likely ever to be ranked as a permanent part of our literature it is not possible to determine. But the sentiment and workmanship of casual verse is improving; certain individuals among the younger writers rise into a high region of thought and expression; and a smaller number, still, give unusual promise of distinguished future performance.

* * *

BRIC-À-BRAC.

Applied Astronomy.

HE took me out to see the stars,
That astronomic bore;
He said there were two moons near Mars,
While Jupiter had four.

I thought of course he'd whisper soon
What fourfold bliss 'twould be
To stroll beneath that fourfold moon
On Jupiter with me.

And when he spoke of Saturn's ring,
I was convinced he'd say
That was the very kind of thing
To offer me some day.

But in a tangent off he went
To double stars. Now that
Was most suggestive, so content
And quite absorbed I sat.

But no, he talked a dreary mess,
Of which the only fraction
That caught my fancy, I confess,
Was "mutual attraction."

I said I thought it very queer
And stupid altogether,
For stars to keep so very near,
And yet not come together.

At that he smiled, and turned his head;
I thought he'd caught the notion.
He merely bowed good-night and said,
Their safety lay in motion.

Esther B. Tiffany.

An Epitaph.

A LADY (who will doubt her home?)
Whose blood was Bay State's bluest,
Once near St. Botolph's town did roam
Among its suburbs newest.

Beside the way she saw a stone—
Small, neat, of plainest granite;
And on one side, with moss o'ergrown,
A lettering: thus ran it—

"I M FROM BOSTON"—"Ah!" she cried,
"What more could he desire
When, after Boston's joys, he died
And went up one step higher.

"A traveler lies here at rest
Who life's rough ocean tossed on;
His many virtues all expressed
Thus simply—'I'M FROM BOSTON.'"

Charles E. Whittemore.

Uncle Esek's Wisdom.

GRAVITY is a weak imposture; wise men never use it, fools don't know how to.

A WISE man believes as much as he can, a fool as little.

RADICALISM is the beginning of decay, Conservatism is the end of it.

WE stand in our own sunshine oftener than others do.

IT is the little things that are the most wonderful and difficult; it is possible for human enterprise to make a mountain, but impossible for it to make an oyster.

THERE is nothing so necessary as necessity; without it, mankind would have ceased to exist ages ago.

THE heart gets weary, but never gets old.

IF a man is right, he can't be too radical; if wrong, he can't be too conservative.

THE silent man may be overlooked now, but he will get a hearing by and by.

METHOD and dispatch govern the world.

YOU can outlive a slander in half the time you can outargue it.

Uncle Esek.

On a Hymn Book.

OLD hymn book, sure I thought I'd lost you
In the days now long gone by;
I'd forgotten where I tossed you:
Gracious! how I sigh.

In the church a thin partition
Stood between her pew and mine;
And her pious, sweet contrition
Struck me as divine.

Yes, remarkably entrancing
Was she in her sable furs;
And my eyes were always glancing
Up, old book, to hers.

Bless you, very well she knew it,
And I'm sure she liked it too;
Once she whispered, "Please don't do it,"
But her eyes said, "Do."

How to speak — to tell my passion?
How to make her think me true?
Love soon found a curious fashion,
For he spoke through you.

How I used to search your pages
For the words I wished to say;
And received my labor's wages
Every Sabbath day.

Ah, how sweet it was to hand her
You, with lines I'd marked when found!
And how well I'd understand her
When she blushed and frowned.

And one day, old book, you wriggled
From my hand and, rattling, fell
Upon the floor; and she — she giggled,
Did Miss Isabel.

Then when next we met out walking,
I was told in tearful tones
How she'd got a dreadful talking
From the Reverend Jones.

Ah me! No man could resist her
In those sweet and buried years,
So I think — I think I kissed her,
Just to stop her tears.

Jones I gave a good, sound chaffing;
Called his sermons dry as bones;
Soon fair Isabel was laughing —
Said she hated Jones.

It was after that I lost you,
For I needed you no more;
Somewhere — anywhere I tossed you
On a closet floor.

Reverend Samuel still preaches;
Isabel her past atones:
In his Sunday-school she teaches —
Mrs. Samuel Jones.

W. J. Henderson.

Adele aus der Ohe.

DECEMBER 23, 1886. (LISZT.)

I.

WHAT is her playing like?
'Tis like the wind in wintry northern valleys.
A dream-pause, — then it rallies
And once more bends the pine-tops, shatters
The ice-crag, whitely scatters
The spray along the paths of avalanches;
Startles the blood, and every visage blanches.

II.

Half-sleeps the wind above a swirling pool
That holds the trembling shadow of the trees;
Where waves too wildly rush to freeze
Though all the air is cool;
And hear, oh hear, while musically call
With nearer tinkling sounds, or distant roar,
Voices of fall on fall;
And now a swelling blast, that dies; and now —
no more, no more.

JANUARY 8, 1887. (CHOPIN.)

I.

Ah, what celestial art!
And can sweet thoughts become pure tone and float,
All music, into the transcended mind and heart!
Her hand scarce stirs the singing, wiry metal, —
Hear from the wild-rose fall each perfect petal!

II.

And can we have, on earth, of heaven the whole!
Heard thoughts — the soul of inexpressible thought;
Roses of sound
That strew melodious leaves upon the silent ground;
And music that is music's very soul,
Without one touch of earth, —
Too tender, even, for sorrow, too bright for mirth.

R. W. Gilder.

To Betsey Prig.

DEAR Betsey, who with courage stout,
And attitude of firm resistance,
Expressed, erewhile, that famous doubt
Of "Mrs. Harris's" existence,—

We have our "Mrs. Harris" too.
We court her, shun her, praise her, flout her,
But oh! we are not brave like you,
We will not, cannot, dare not *doubt* her!

She's had a score of names almost.
In "teacup times" of cards and tattle
She was "the *Mode*" to Belle and Toast,
"The *Ton*" to Messrs. Froth and Rattle.

She's "Fashion," now to Beauty's eyes,
"The World" to some, to some "Propriety";
And in her most appalling guise
She boasts that awful name, "Society."

Time was, her elder lieges say,
She dwelt (or seemed to dwell) in Paris;
She "hails" from Albion's shores to-day,
Our tutelary "Mrs. Harris."

What mortal can escape her thrall?
Nurse Sairey o'er our cradle dozing
Mumbles her hated name, on all
Our helpless necks her yoke imposing.

For her we toil and plot and spend;
For her we barter health and treasure:
What does she give us at the end —
What smallest good, what poorest pleasure?

What do we gain for weary bones?
What do we get for all our giving?—
Tinsel for solid gold, and stones
For bread of wholesome human living!

Join hands, dear Betsey! Slave too long
To other men's beliefs about her,
I'll pluck up heart of grace, and strong,
Like you, I'll nobly dare to doubt her!

See! Here all fears away I fling —
I take your name to hang my verse on:
I doubt her power, her — everything!
"*I don't believe there's no such person!*"

Robertson Trowbridge.

To a Watch-Hand.

LIKE a leaf by breezes set a-tremble,
Like a wave reflecting sparks of fire —
Little needle, your quick throbs resemble
Those that hope and fear in me inspire.

Light and fleet as lissom Atalanta,
You, swift runner, hold the winning race,
Since you never pause nor go askant a
Moment, for the golden apple's grace.

Yet I rather, seeing every second
Marked so gaily on your courier-track,
Feel myself by you drawn on and beckoned
Towards the goal of love, and turn not back.

I will follow your elastic sprinting;
Lilt away! Wherever you may lead,
There the world a disk of gold seems glinting,
Over which we course with airy speed.

So, my watch-hand, circling round the dial,
When the moment and the maid you meet,
Tell her I am near, nor can denial
Keep me longer from her presence sweet.

Tell her for me, little interceder,
Never can my heart range far away;
Back it comes to her, with you for leader,
True to her each minute of the day.

George Parsons Lathrop.

Beautiful Spring.

"A TENDER veil of green adorns the willows;
The grass is springing up in sunny places;
The ice no longer holds in chains the billows;
The violets soon will show their modest faces.
Oh Spring, fair Spring, we hasten forth to greet thee,
Our frost-bound hearts throb with fresh joy to meet
thee."

Thus wrote the Poet, and he read it over —
Being quite young — with modest approbation,
Gazing across a field of (last year's) clover,
And exercising his imagination.
And being caught by several April showers,
He only murmured something of "May flowers."

But the next morning, with a north wind blowing,
And leaden skies above, he changed his ditty.
"No!" growled he, "I will *not* look how it's snowing!
Pull down the blind, if you've a spark of pity.
Stir up the fire, and make it kindle faster;
And *will* you mix me that red-pepper plaster?"

"If anything could start my circulation,
'Twould be that Pilgrim Father's business, surely.
To think they undertook to found a nation,
And counted on its future so securely,
After they'd seen — no, it was *not* sublime — it
Was idiotic, settling in this climate!"

Margaret Vandegrift.

A Sign of Spring.

THE frozen brooks refuse to flow;
The air is filled with flying snow,
In sudden showers:
Yet something tells me Spring is near,
Sweet Spring, who brings the waiting year
Its birds and flowers.

'Tis not that I have faintly heard
An echo from some singing bird,
Adown the gale;
Nor in the leafless woods have found,
Half hidden in the icy ground,
One blossom pale:

No, something fairer proves the birth
Of sunny days, a sign that's worth
A Herrick's sonnet.
'Tis Delia with a charming frown,
In doubt just how to trim the crown
Of her Spring bonnet.

CANTERBURY CATHEDRAL.

as well as see will be wise if he looks at it only after he has looked elsewhere — at Durham, for example, at Ely, Peterborough, Norwich. But the existing fabric of a cathedral which has a history of some dozen centuries is not its only claim upon our retrospective thought; and when we weigh all claims together, it is impossible not to speak first of that cathedral which is the mother church of England by a double title,— by the right of earliest birth and by that of constant rule.

I.

CHAUCER'S merry company, intent "the holy blisful martir for to seeke," made their start in that month of April whose delights their poet never tired of singing. But the modern pilgrim, thinking less than they of winter's mud or summer's dust, is most fortunate upon an August day; for it is always worth while to see the best of anything terrestrial, and a Kentish hop-garden in full growth is the fairest thing in the way of a useful crop that the earth produces.

A London start is made by the Victoria Station and the train "for Chatham and Dover"—prosaic words, suggestive less of Canterbury than of Calais and the Channel's woes. Yet for a long distance the modern path of iron lies practically parallel with the old white high-road. We only make an intermediate

CANTERBURY'S cathedral church has known much rebuilding, and to-day it is not one of those which give us our most broadly written lessons in the earlier history of English art. The student who likes to understand

stop at Chatham, and if its name has no ancient savor and its importance is in truth bound up with that of modern naval warfare, yet it soon shows as but a suburb of hoary episcopal Rochester, and the eye embraces almost in a single glance the cathedral founded in the seventh century, the castle built for the men-at-arms of Henry II., and the dockyards where Queen Victoria's iron-clads are at home.

It is always so in this delectably little land. Everywhere the same *mise-en-scène* has served for the playing out of various dramas and is still in use to-day. The soil is everywhere rich with buried history and set thick with the artistic relics of all eras, and the air is never free from puissant memories. Britain among the lands is as Rome among the cities: the story of any one of her districts is as difficult to tell in brief as the story of any Roman site. Rarely indeed can we say: For *this* reason is this spot of interest. There are usually a score of reasons, a dozen interests of successive date. And we often come upon historic repetitions of so happy a sort that they seem to have been planned by some great cosmic playwright in the interests of artistic unity, dramatic point, and concentration. There were, for instance, many spots along the coast where St. Augustine might have landed when he was on his way to Canterbury and the court of Ethelbert. But the spot where he did land chanced to be at the mouth of the Thames, on the Isle of Thanet — coming to convert the heathen English and following by a picturesque coincidence in the steps of their earliest band of settlers.

II.

VERY charming to the outer eye, Canterbury is no less pleasing to the eye of sentiment; for sentiment, as I conceive it (at least where the tourist is in question), means some-

thing close akin to the love of symbolism. What it asks is correspondence between body and spirit — between things tangible and visible and things dictated by memory and imagination. If a town does not look as it looked of old, and if its aspect fails to tally with that special aspect the fancy has been led to lend it, we are sentimentally outraged — alas, how often! — as by the breaking of a tacit promise. But Canterbury keeps all its tacit promises with singular fidelity.

From a distance it seems scarce a town at all — rather a great solitary church standing on a slight elevation and backed by higher hills. And a modest town it is in fact, low-roofed and narrow-bordered, with no touch of municipal dignity and no evidence of private wealth; breathing a breath of almost country air, and basking sleepily in a mood of almost rural quiet, resting meekly at the foot of its mighty church, guarding tenderly the ruins of its great monastic houses.

But all this is no disappointment; for the greatness of Canterbury was not material but spiritual — or, if I were to seek the truest word, I might say *emblematic*. Her fame is the fame of the great men who, taking their title from her, went out of her gates to help or

hinder kings and parliaments in their rule of the land. And the authority delegated to them stood not upon wealth or arms or civic strength but upon ecclesiastical might. So it is fitting she should have been small and modest in street and square — great and beautiful only in the body of that splendid temple which expresses all there ever was of her truest self.

In mediæval days her walls were complete, of course; the Conqueror's castle, now a wreck, was haughtily conspicuous; and sleepiness was certainly not her mood — what with the sumptuous living and parading of bishop and abbot and priest and knight, and the bloody wranglings of each with the others; what with the pulsing of that vast pilgrim-tide which from every English shire and every Christian country brought its motley myriads to the wonder-working (and wonderfully well "exploited") shrine of St. Thomas. But nevertheless the city itself must have been so nearly the same in general effect that we can easily people it anew with its tumultuous shows of faith and superstition, force and fraud, humility and luxury, pride, licentiousness, and greed. Modern growth has not burst its ancient body asunder and re-worked it into an alien shape. Nor has modern life gone wholly from its streets

THE CATHEDRAL, FROM THE NORTH-WEST.

THE CATHEDRAL, FROM THE SOUTH-WEST, AT SUNSET.

and left them to solitude, neglect, and death. Canterbury is cheerfully alive despite the long cessation of the busy ecclesiastical industries of old; not dead but merely dozing in a peace unbroken by the rushing traffic of to-day.

III.

I HAVE called the cathedral the mother church of England, but in one sense the term is still better deserved by little St. Martin's on the eastward hill. Look narrowly at these ancient walls and you will see embedded in their substance fragments more ancient still, fragments of Roman bricks, which tell that at the close of the sixth century, when the first missionaries to the English landed, therestood on this same site a tiny British church. Somehow it had weathered the storms of pagan years and now was the private oratory of Ethelbert's queen — that Bertha who was already a Christian when she left her Paris home. Here St. Augustine held his first service beneath an island roof, and here he baptized his first convert, King Ethelbert himself.

The church, though very old, has certainly been rebuilt since the sixth century; and only

the most easy-going of sentimentalists will believe quite all he is bidden to believe about its furniture and tombs. But to one disinherited of gray memorials by the accident of birth across the sea, it is interesting enough merely to stand upon a spot where such tales can be told with such color of likelihood. And then little St. Martin's, which represents the first tiny rootlet of English Christianity, gives him from beneath its low ivied tower and dusky churchyard yews his best first point of outlook toward that greater church which typifies the full-grown tree. Hence he may gaze over the whole beautiful green valley of the Stour to its far-off western hills; may trace the path where from this first tentative station the first missionary passed, as consecrated primate, with banner and silver cross and pomp of singing down to the royal town; and may see this town in the center of the picture, on its outskirts the remains of the great suburban monastery founded by St. Augustine and named for him, and in the midst of the town the cathedral which he called "Christ Church" uplifting its gigantic tower and showing in the mere spread of its transepts a length so great that one is easily cheated into thinking it the

MERCERY LANE.

spread of nave and choir instead. If we could see but a single English landscape we might well choose this; and if we could select but a single hour it might best be from one of those summer afternoons when the witchery of sloping light enhances the charms of color and form, and shines through the perforations of far-off pinnacle and parapet until their stone looks like lace against the sky and their outlines seem to waver in harmony with the lines of cloud above.

IV.

BUT when we come back to earth again, descend to the valley level, and go to take nearer survey of the church itself, then we had best approach it through that narrow Mercery Lane which Mr. Pennell pictures.* It took its title from the arcades of booths

* The house to the left stands on the spot where stood the Chequers Inn of Chaucer's time, and the old vaulted cellars still exist beneath it.

where mementos of pilgrimage were bartered for such pounds or pence as might remain when St. Thomas had secured his tribute, and was always, as to-day, the chief path to the church. Since the early sixteenth century it opens out beneath the beautiful Perpendicular Christ Church Gateway, gives access to a broad green space that is still called the Churchyard and was once the resting-place of pilgrims claimed by death, and shows the western front and long south side of the cathedral in a perspective of lordly picturesqueness.

On this spot too as well as on the eastern hill St Augustine found a surviving British church which could be consecrated, repaired, and used anew. Practically the same as in earliest days,—a basilica imitated from old St. Peter's at Rome, without transepts, but with an apse at either end,—it seems to have done England's archbishops service until the tenth century. And thereafter—largely rebuilt and with heightened walls but still essentially the

same—it housed the whole mighty race of pre-Norman primates. Hither, one chiefly cares to think, came Dunstan to begin his rule of the Church and to persist none the less in his efforts to rule the State. Here he warred alike against the princes and powers of this world and of the other, and with quite peculiar vigor against the secular clergy.

The story of all such ecclesiastical struggles is brilliantly picturesque just by virtue of its departure from what seem to us ecclesiastical modes of warfare. There is a world of sug-

rather than rob his people and live by the gold which he knew would but bribe to further rapine and a more profuse shedding of blood—he too was canonized and wrought marvels with his bones. But the unsaintlier kind of saint seems in those days to have been thought the better advocate on high, and Dunstan ruled supreme in the local storehouse of relics till St. Thomas came to oust him from his rank.

Saint or not, however, Dunstan was a mighty artist before the Lord, working with pen and brush, in gold and silver and brass

CHRIST CHURCH GATEWAY, FROM MERCERY LANE.

gestiveness in Dean Milman's phrase: "It was not by law but by the armed invasion of cathedral after cathedral that the married clergy were ejected and the Benedictines installed in their places." Yet did not "the dove that erst was seen of John in Jordan" hover over Dunstan in a burst of celestial light at the hour which made him primate? Was he not a visible child of heaven and a miracle-worker while alive, and a saint and a still greater miracle-worker after death? Archbishop Alphege, accepting murder from the Danes

and iron, in the casting of bells, in the making of musical instruments and the making of music thereupon. Richer clay than modern Nature uses must have gone to the substance of these mighty men of old—meddlers in every department of human effort and easily masters in all. Every land seems once to have had its own deposit—was the last handful used when Michael Angelo was molded?

Twenty-three years after Dunstan's death happened the murder of Alphege and the sacking of the cathedral by the Danes. Ca-

THE CATHEDRAL, FROM CHRIST CHURCH GATEWAY.

nute repaired the structure as best he might, and hung up his golden crown as vicarious atonement for his countrymen's sacrilege. But the last archbishop to stand within its shattered, patched-up walls was that Stigand

whose figure shows so vividly on the striking page where Mr. Freeman paints Harold struggling with the Conqueror. When William came to Harold's throne and Archbishop Lanfranc to Stigand's, Norman fires had completed what

Danish torches had begun. Lanfranc was compelled to build an entirely new church, and naturally he built it in the "new Norman manner," closely according to the pattern of St. Stephen's Church at Caen on the Norman mainland.

Only a few years later, during the primacy of Anselm, Lanfranc's choir was itself pulled down and reconstructed upon a larger scale. Ernulph (of whom we shall hear again at Peterborough) and Conrad were priors of the convent in Anselm's day and seemingly the actual architects of his choir, which was dedicated in the year 1130, Henry of England being present with David of Scotland and every bishop of the realm, and "the ceremony the most famous that had ever been heard of on earth since that of the temple of Solomon."

This was the church—Lanfranc's nave and transepts, and Anselm's choir—in which Becket was murdered. But only four years later it was damaged by a great catastrophe described by Gervase the monk in words incomparably graphic. The "glorious choir of Conrad" caught fire in the night, cinders and sparks blowing up from certain burning dwellings near at hand and getting unperceived a fatal headway between "the well-painted ceiling below and the sheet-lead covering above." But the flames at last beginning to show themselves, "a cry arose in the churchyard, '*See, see, the church is burning!*'" Valiantly worked monks and people together to save it. The nave was rescued, but the whole choir perished, and "the house of God, hitherto delightful as a paradise of pleasures, was now made a despicable heap of ashes."

Small wonder that monks and people then addressed themselves to lamentation with true mediæval fervor. They "were astonished that the Almighty should suffer such things, and maddened with excess of grief and perplexity, they tore their hair and beat the walls and pavement of the church with their heads and hands, blaspheming the Lord and his saints, the patrons of the church. Neither can mind conceive or words express or writing teach their grief and anguish. Truly, that they might alleviate their miseries and anguish with a little consolation, they put together as well as they could an altar and station in the nave of the church, where they might wail and howl rather than sing the nocturnal services."

Is not the value men set upon the work of their hands but a reflex of the measure of enthusiasm they put into its making? Should we not know without further witness that an age which could lament like this must have been an age of mighty builders? And truly these Canterbury folk went mightily to work when the first spasm of rage and grief and fear

was over. A French architect, William of Sens, was their first builder, and in the four years ere he was disabled by falling from a scaffold, had completed the walls of choir and presbytery and was preparing to turn their vaults. His successor—also "William by name," though "English by nation, small in body, but in workmanship of many kinds acute and honest"—constructed the retro-choir for Becket's shrine and the apse-like terminal chapel now known as "Becket's Crown."

The goodly work of these two Williams still stands as when they wrought it to the glory, one cannot but confess, rather of St. Thomas than of God. Lanfranc's nave and transepts, grown ruinous, were rebuilt in the fourteenth century in the earliest version of the Perpendicular manner. One of his western towers, that at the southern angle of the façade, was replaced in the middle of the fifteenth century, and some years later was built the great central tower above the crossing. As for the north tower of the west front, it survived as Lanfranc had left it until the second quarter of our own century, when, alas! it was pulled down and made to "match" its brother.

v.

To understand the cathedral as we see it now we must understand St. Thomas's posthumous part therein, and to conceive of this, the rôle that relic-worship played, more or less through many centuries and in every part of Christendom, but with especial architectural emphasis in the twelfth century and on English soil.

It is not too much to say that then and there the fame and frequentation of a church, and consequently a large part of its wealth and power, depended chiefly upon the relics it possessed or could lay plausible claim to owning. From the armed hand to the bribing ducat and the lying mouth and the secret theft, there was no device which the saintliest of ecclesiastics scorned or feared to use in his great task of enriching his church with the blood and bones and heterogeneous remains of departed sainthood. For generations St. Augustine's monastery outranked the cathedral church of Canterbury in every way save name alone, largely because, in deference to an ancient law forbidding intramural interments, the bodies of St. Augustine and his first successors had been placed in its suburban keeping. The ninth archbishop named the cathedral as his own place of sepulture confessedly on this account. His purpose was compassed by a fraud dictated from his death-bed, and was secured by his chapter's vigorous resistance when the disappointed brethren of

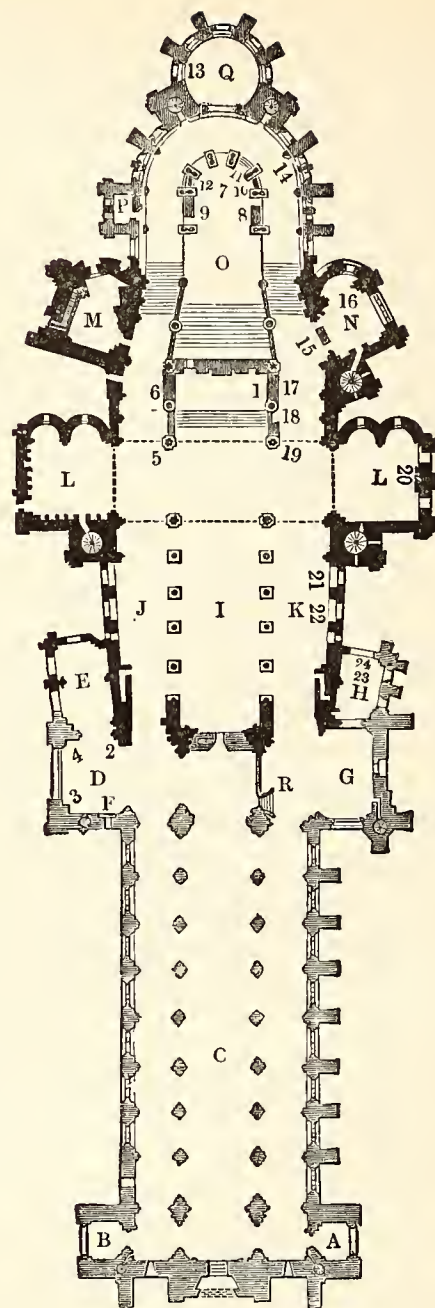

St. Augustine's came in arms to claim the corpse. But the precedent thus established held valid for the future, and with what immense profit was seen clearly when Becket went bleeding to his tomb and straightway became the most famous intercessor in all Europe.

In the earliest ages the crypt beneath the choir had been the usual place of saintly sepulture. But long before Becket's death, relic-worship had so developed that the throngs it drew together and the stately ceremonies it involved demanded statelier housing. Place was made for the saints in the choir itself, behind the high altar to the eastward. When Anselm pulled down Lanfranc's new choir simply that he might build a larger, it was undoubtedly in deference to these growing needs.

Becket himself was first buried in the crypt; but the reason and the manner of his death, and the haste, terror, and intimidation which immediately followed, were the choosers of his grave. When Anselm's choir was burned he was already canonized and world-renowned; and when it came to be rebuilt his due enshrinement was the main concern. Often hereafter we shall see how the choir of a cathedral grew to its enormous size through its ownership of some saint's dust. But nowhere is the saint's dominion so clearly petrified as at Canterbury. Nowhere does a cathedral speak so strongly of his paramount local importance or so distinctly perpetuate the peculiar details of his fate.

Rarely has so honorable a monument been decreed a mortal; and rarely has a mortal who stands so well within the borders of authentic history been so diversely judged as worthy or unworthy honor. Pure and vile he has been called — nay, is still called — with equal sincerity of emphasis; wise and foolhardy, self-immolating and self-seeking. Saint and bigot have been his names, martyr and criminal, hero and traitor, champion of liberty and would-be enslaver of king and people. Unfortunately most of our earliest ideas about him came to us as part of our Puritanical inheritance, dictated in utter oblivion of the unlikeness of his time to ours. And, still more unfortunately, the most brilliant and accessible biography which appeals to adult eyes is Mr. Froude's — one that is marked not by the somewhat excusable ignorance of the school-book but by the blindness or partisan distortions of a pen that brings to the task of the historian the methods of the prosecuting attorney.

Of course the most obvious thing to say of Becket is that he was warring against the Crown and for the Church and a foreign head of the Church; and Church against State in the England of to-day would of course mean menace to men's liberties. An archbishop who should

to-day defy the civil executive would indeed be well branded traitor. But the twelfth century was not the nineteenth nor even the sixteenth; and when its own perspective is understood it shows us Becket in a very different light. It shows that he was no saint as we count saints to-day, no churchman, or statesman of the pattern we should ask to-day, and perchance not even consciously a champion of the people while an opponent of the king; but nevertheless a great, almost an heroic, Englishman; in every way a brave man; in many things a wise man, and after current

lights a conscientious one; and, whether designedly or not, a mighty agent toward winning the long fight for English liberty. It is here his name should be enrolled, in the narrative of that long battle which began with the very birth of the English people — before the actual birth of the English nation — and by no means closed upon the scaffold of King Charles. With all its faults the Church of Becket's day was the only possible helper of the people. With all his tyrannous intentions the Bishop of Rome was just then a less dangerous shepherd than Henry the Angevin king. When we read the signature of a later archbishop on the Great Charter of freedom — when we find Stephen Langton heading the list of those who compelled King John to do the nation's will and defying at once the despotism of royalty and of Rome — it is but just to remember that Becket, defying royalty in the name of Rome, combating an adversary far more dangerous than John, had taken the first step which made Langton's step secure. A later Henry saw this truth. "Reforming" the Church less with the wish to purify religion than with the desire to extend the royal power, Henry the Eighth had St. Thomas's shrine destroyed and his body burned and his pictures obliterated and his name stricken from calendar and mass-book, more because he was a "traitor" in his eyes than because he had become a wonder-worker in the eyes of superstition. The blood of a martyr was in Becket's case the seed of power and wealth and honor to the Church, and possibly also of some more or less pious kind of piety, as well as of that frightful dissoluteness which the old poets paint as the outcome of the pilgrimages. But its greatest interest for us is as one of the germs of that splendid stock of English freedom to which Americans as well as Englishmen are the fortunate heirs. The archbishop who gave his life to uphold the standard of the Church against the standard of the king, and the Puritan who beat down king and Church together beneath the flag of liberty, had more in common than either in his day could possibly have understood.

VI.

It may be a surprise to one coming from the continent when he finds but a single little unused doorway in the west façade at Canterbury and sees the main entrance in a great porch projecting from the *southern* side of the south-western tower. In truth, however, this is its most characteristically national, most typically English station — as is proved by very many of those rural churches which, more wholly than their vaster sisters, were the outcome of local tastes and old traditions. In a

great church like Canterbury great western portals are indisputably better from an architectural point of view. Yet for once we are glad to find so English a feature as the southern porch, if only because it is the single voice which speaks of the original cathedral. All that survives of a time anterior to Norman reconstruction, all that suggests the church of the British Christians, of St. Augustine and Dunstan and Alphege and Stigand, is this single witness to its plan, this perpetuator of its great "Suthdure."

Passing through it into the extreme west end, we see the great bare nave as it stood when Chaucer's pilgrims saw it clothed. The difference in effect that has been wrought by the five centuries is very great but merely superficial — a decorative, not an architectural change. I need hardly try to tell how and why all beauty save that of the stones themselves has vanished — the chartered havoc of King Henry's delegates and the lawless and thrice-ruinous destruction of Cromwell's are among the most familiar tales of history; and almost any tourist will be wise enough to take account as well of post-Reformation neglect and whitewash, and of modern "restorations." In the old days an interior like this was covered in every inch of floor and wall and ceiling with color and gold in tints that charmed the eye and figures that touched emotion, and was lighted by windows like colossal gems and tapers like innumerable stars — color and light and incense-smoke mingling together to work a tone of radiant depth and harmony. It was furnished with altars and tombs and chantries and trophies and statues and embroidered hangings, trodden by troops of gaudily clothed ecclesiastics, and filled with a never-lessening crowd of worshipers. To-day it is cold and bare and glaring, scraped to the very bone, stripped of all save the architect's first result, and empty even of facilities for occasional prayer; for at Canterbury, as in many another English church of largest size, the screened-off choir is alone put to use and the nave abandoned to the sight-seer's undevoutness. Protestantism, from an artistic point of view, is not a very successful guardian of cathedrals.

Not that the pure and strict architectural beauty which alone is left amounts to little. Tremendous indeed and exceedingly beautiful is the effect of Christ Church Cathedral when we enter, although we see on the floor level but the nave alone with a dim vista of long upper arcades and reaches of choir-ceiling over high barriers of central screen and iron aisle-gates. In certain other cathedrals these barriers to foot and eye have recently been swept away. The change is usually considered happy. But it is a question whether the immediate reali-

zation of magnitudes thus afforded is not too dearly bought. There is a mystery, an impressiveness about the old arrangement,—a mystery as of holier holies beyond the first, an impressiveness as of endless spaces extending from this space already so enormous,—a suggestion not of magnitude but of infinitude which has a potent charm. Moreover, it *is* the old arrangement. These great churches were meant to be divided, were built *not* to be seen from end to end, but part by part in slow succession. They were not parish-churches meant first of all for laymen's worship, but special places of worship for the cathedral chapter. The people were given free access to the nave and were admitted within the choir at proper times and in duly ordered streams, to gaze upon its crowning grandeurs and pay reverence to its holy sleepers. But they did not belong there, and the old screens typify the fact.

VII.

THE great peculiarity at Canterbury is not that the choir is thus protected, but that the central screen is raised on a high flight of steps which leads up from the nave and transepts. If from the balustrade of the platform thus created we look down into the north transept, we see the very spot where Becket fell and even some of the very stones that saw his fall. A piece of the pavement where his brains were scattered by the point of Hugh de Horsea's sword remained undisturbed in the fourteenth-century reconstruction, and a fragment of the eastern wall of the transept, close by the entrance to the crypt beneath the choir, against which he braced himself when the fierce hand-to-hand fight was nearly over. Opposite this is the door, also keeping some of its old stones through which he entered from the cloisters. All else of the Norman transept is gone, including the pillar supporting an upper chapel to which he clung for a moment, and the stairs by which he sought to reach the altar. But the exact situation of these last is shown by a corresponding flight that still exists in the south transept, and altogether it needs scarcely an effort to bring the whole tragedy back to mind exactly as it passed in that dim December twilight.

Few tragedies in all history or all story have been so dramatic, thrilling, grandiosely mournful as this which shows us the death if not of a saint, if not of a martyr, yet of a great leader ensnared by overconfidence, pursued by naked swords, a cursing band of royal sleuth-hounds at his throat and all his monkish friends save three in howling flight; retreating step by step and growing prouder and sterner with

each, not for a moment demoralized into flight himself; fighting with voice and hand till fight showed itself in vain, and then accepting the end with noble composure and meek words of prayer, falling beneath the cruel blows so calmly that the very folds of his clothing were undisturbed. At the last it *was* almost the death of a saint and martyr, certainly the death of a brave Englishman who believed he was dying for a great and holy cause. So dramatic is the scene, so impressively and appropriately picturesque the setting, and so full the contemporary accounts which tell of it,—so accurate in description, so minute in detail, and so rich in rhetorical comment,—that while we are at Canterbury its memory almost swallows up the interest of all memories alien to it.

It has not even yet gone quite out of the popular mind, usually filled with such different matters. A shabby, grimy personage—a tramping artisan, by his bag of tools—spoke to me one morning when we found ourselves alone in the deserted nave while service went on in the choir, and after a somewhat confused preamble asked whether I could tell him the spot where Becket died—"the place where they beat him down on his knees and dashed his brains out on the stones." And he shifted his bundle as he spoke and punctuated his phrase with a sweep of the arm as impassioned and expressive if not as graceful or as purposeful as could have been De Tracy's own.

VIII.

IN almost every English cathedral it will cost you a sixpence and the writing of your name in a big book like a hotel register to penetrate within the choir; but nowhere else, save in Westminster Abbey, will your subsequent steps be so hampered as in Canterbury. Nowhere does the verger shepherd his tourist-flock so sternly or so immediately turn it out into the nave again when his poor, parrot-like, peregrinating recitative is finished. Some sort of safe-conduct—preferably a written permit from the Dean—is quite essential if you would see Canterbury's choir with aught of pleasure or of profit.

The first thing that strikes even a slightly practiced eye is the unlikeness of the choir to the usual English type either of its own date or of any other. The second pair of transepts, far to the eastward of the first, is paralleled in three or four large churches elsewhere. But instead of a long level floor, broken only by a few steps before the altar, here is a floor divided into different levels by broad successive flights, giving an unwonted air of majesty and pomp. Then the line of the great arcades and of the

Danish torches had begun. Lanfranc was compelled to build an entirely new church, and naturally he built it in the "new Norman manner," closely according to the pattern of St. Stephen's Church at Caen on the Norman mainland.

Only a few years later, during the primacy of Anselm, Lanfranc's choir was itself pulled down and reconstructed upon a larger scale. Ernulph (of whom we shall hear again at Peterborough) and Conrad were priors of the convent in Anselm's day and seemingly the actual architects of his choir, which was dedicated in the year 1130, Henry of England being present with David of Scotland and every bishop of the realm, and "the ceremony the most famous that had ever been heard of on earth since that of the temple of Solomon."

This was the church — Lanfranc's nave and transepts, and Anselm's choir — in which Becket was murdered. But only four years later it was damaged by a great catastrophe described by Gervase the monk in words incomparably graphic. The "glorious choir of Conrad" caught fire in the night, cinders and sparks blowing up from certain burning dwellings near at hand and getting unperceived a fatal headway between "the well-painted ceiling below and the sheet-lead covering above." But the flames at last beginning to show themselves, "a cry arose in the churchyard, '*See, see, the church is burning!*'" Valiantly worked monks and people together to save it. The nave was rescued, but the whole choir perished, and "the house of God, hitherto delightful as a paradise of pleasures, was now made a despicable heap of ashes."

Small wonder that monks and people then addressed themselves to lamentation with true mediæval fervor. They "were astonished that the Almighty should suffer such things, and maddened with excess of grief and perplexity, they tore their hair and beat the walls and pavement of the church with their heads and hands, blaspheming the Lord and his saints, the patrons of the church. Neither can mind conceive or words express or writing teach their grief and anguish. Truly, that they might alleviate their miseries and anguish with a little consolation, they put together as well as they could an altar and station in the nave of the church, where they might wail and howl rather than sing the nocturnal services."

Is not the value men set upon the work of their hands but a reflex of the measure of enthusiasm they put into its making? Should we not know without further witness that an age which could lament like this must have been an age of mighty builders? And truly these Canterbury folk went mightily to work when the first spasm of rage and grief and fear

was over. A French architect, William of Sens, was their first builder, and in the four years ere he was disabled by falling from a scaffold, had completed the walls of choir and presbytery and was preparing to turn their vaults. His successor — also "William by name," though "English by nation, small in body, but in workmanship of many kinds acute and honest" — constructed the retro-choir for Becket's shrine and the apse-like terminal chapel now known as "Becket's Crown."

The goodly work of these two Williams still stands as when they wrought it to the glory, one cannot but confess, rather of St. Thomas than of God. Lanfranc's nave and transepts, grown ruinous, were rebuilt in the fourteenth century in the earliest version of the Perpendicular manner. One of his western towers, that at the southern angle of the façade, was replaced in the middle of the fifteenth century, and some years later was built the great central tower above the crossing. As for the north tower of the west front, it survived as Lanfranc had left it until the second quarter of our own century, when, alas! it was pulled down and made to "match" its brother.

V.

To understand the cathedral as we see it now we must understand St. Thomas's posthumous part therein, and to conceive of this, the rôle that relic-worship played, more or less through many centuries and in every part of Christendom, but with especial architectural emphasis in the twelfth century and on English soil.

It is not too much to say that then and there the fame and frequentation of a church, and consequently a large part of its wealth and power, depended chiefly upon the relics it possessed or could lay plausible claim to owning. From the armed hand to the bribing ducat and the lying mouth and the secret theft, there was no device which the saintliest of ecclesiastics scorned or feared to use in his great task of enriching his church with the blood and bones and heterogeneous remains of departed sainthood. For generations St. Augustine's monastery outranked the cathedral church of Canterbury in every way save name alone, largely because, in deference to an ancient law forbidding intramural interments, the bodies of St. Augustine and his first successors had been placed in its suburban keeping. The ninth archbishop named the cathedral as his own place of sepulture confessedly on this account. His purpose was compassed by a fraud dictated from his death-bed, and was secured by his chapter's vigorous resistance when the disappointed brethren of

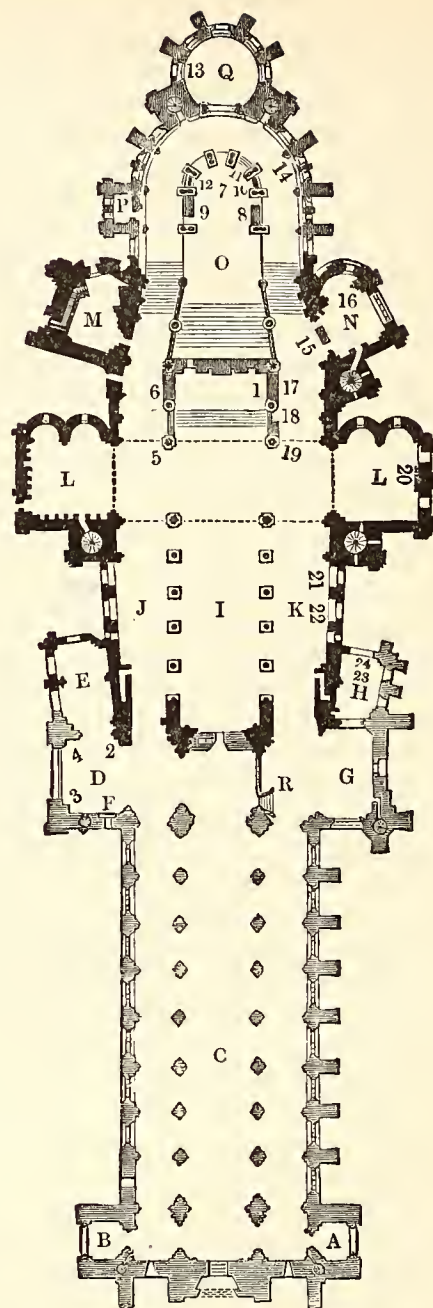

St. Augustine's came in arms to claim the corpse. But the precedent thus established held valid for the future, and with what immense profit was seen clearly when Becket went bleeding to his tomb and straightway became the most famous intercessor in all Europe.

In the earliest ages the crypt beneath the choir had been the usual place of saintly sepulture. But long before Becket's death, relic-worship had so developed that the throngs it drew together and the stately ceremonies it involved demanded statelier housing. Place was made for the saints in the choir itself, behind the high altar to the eastward. When Anselm pulled down Lanfranc's new choir simply that he might build a larger, it was undoubtedly in deference to these growing needs.

Becket himself was first buried in the crypt; but the reason and the manner of his death, and the haste, terror, and intimidation which immediately followed, were the choosers of his grave. When Anselm's choir was burned he was already canonized and world-renowned; and when it came to be rebuilt his due enshrinement was the main concern. Often hereafter we shall see how the choir of a cathedral grew to its enormous size through its ownership of some saint's dust. But nowhere is the saint's dominion so clearly petrified as at Canterbury. Nowhere does a cathedral speak so strongly of his paramount local importance or so distinctly perpetuate the peculiar details of his fate.

Rarely has so honorable a monument been decreed a mortal; and rarely has a mortal who stands so well within the borders of authentic history been so diversely judged as worthy or unworthy honor. Pure and vile he has been called — nay, is still called — with equal sincerity of emphasis; wise and foolhardy, self-immolating and self-seeking. Saint and bigot have been his names, martyr and criminal, hero and traitor, champion of liberty and would-be enslaver of king and people. Unfortunately most of our earliest ideas about him came to us as part of our Puritanical inheritance, dictated in utter oblivion of the unlikeness of his time to ours. And, still more unfortunately, the most brilliant and accessible biography which appeals to adult eyes is Mr. Froude's — one that is marked not by the somewhat excusable ignorance of the school-book but by the blindness or partisan distortions of a pen that brings to the task of the historian the methods of the prosecuting attorney.

Of course the most obvious thing to say of Becket is that he was warring against the Crown and for the Church and a foreign head of the Church; and Church against State in the England of to-day would of course mean menace to men's liberties. An archbishop who should

IN almost every English cathedral it will cost you a sixpence and the writing of your name in a big book like a hotel register to penetrate within the choir; but nowhere else, save in Westminster Abbey, will your subsequent steps be so hampered as in Canterbury. Nowhere does the verger shepherd his tourist-flock so sternly or so immediately turn it out into the nave again when his poor, parrot-like, peregrinating recitative is finished. Some sort of safe-conduct—preferably a written permit from the Dean—is quite essential if you would see Canterbury's choir with aught of pleasure or of profit.

The first thing that strikes even a slightly practiced eye is the unlikeness of the choir to the usual English type either of its own date or of any other. The second pair of transepts, far to the eastward of the first, is paralleled in three or four large churches elsewhere. But instead of a long level floor, broken only by a few steps before the altar, here is a floor divided into different levels by broad successive flights, giving an unwonted air of majesty and pomp. Then the line of the great arcades and of the

THE WEST FRONT, FROM THE PATH TO HARLEDDOWN.

aisles-walls is not straight, but takes an inward trend eastward of the second transepts. An almost straight-sided space again succeeds; and then the far-off termination is neither the simple semicircular Norman apse nor the flat east end of later days. It sweeps inward as though to form the typical apse, but in the center of the curve opens out into a slender lofty chapel almost circular in plan. All these peculiarities give an individual accent and a special beauty to the work; and all have a curious historic interest.

The Norman choir so nearly perished in the great conflagration of 1174 that almost the whole interior now shows, as I have said, the work of the two Williams. But the lower portions of its outer walls survived together with two chapels, finished as stunted towers, which had projected from the curvature of the apse on either hand. The preservation of these walls and chapels necessitated that inward trend which, seeming at first a beautiful but willful device, thus really perpetuates the extent and outline of the old "glorious choir of Conrad." Then from the center of the old apse-line had projected a square chapel, dedicated to the Trinity and regarded as the church's holy of holies. On the site of this and above his first tomb in the crypt, it was thought fitting that St. Thomas should be given final sepulture. But a mere small isolated chapel would by no means serve his turn. A wide dignified open space was needed and circumambient aisles to receive a thousand feet at once. And so the church was again extended at full breadth.

VOL. XXXIII.—106.

There is more doubt as to the exact reason which dictated the final circular chapel. Its rightful name is *the corona*; and this name has been popularly translated to mean "Becket's Crown," in the belief that the chapel was built as a separate shrine for the scalp which was severed from his head by De Brut's fierce final blow. One cannot but believe Professor Willis — the church's great expounder — when he says there is no real authority for such an explanation, not even though one knows that the scalp was long exhibited by itself in a jeweled golden box. But it is a picturesque explanation, and if we must reject it there seems no other save that mere desire for an unusual kind of beauty which seldom swayed an architect in the days when ecclesiastical art was logically devoted to the service of definite rituals and the meeting of definite special needs.

Were this corona omitted, the termination would show the common type of post-Norman times — but as France, not England, was developing it. Here, as everywhere in the choir in fact, we see the impress of French fashions, the sign-manual of that William of Sens who must have planned the whole, though, as Ger vase says, "the vengeance of God or the spite of the devil" permitted him to complete only the choir proper and the presbytery, and forced him to leave all that lay eastward of the high altar to the hand of English William. The cathedral in his own town of Sens evidently served him as a model. The style is neither Norman nor fully developed Gothic, but intermediate between the two — Transitional. But veritably English Transitional work has a very

CANTERBURY, FROM THE ROAD TO WHITSTABLE.

different accent, especially when so “advanced” as this.

There are many conspicuous points of unlikeness, but the most conspicuous — one which influences the whole effect of the interior far more forcibly than might be thought — lies in the character of the capitals on the great piers and on all the lesser shafts that flank the windows or support the vaulting-ribs. As soon as in truly English work a capital loses its Norman form and feeling, it gets an elongated cup-like shape finished with a *round* abacus above, and is ornamented (if at all) with a peculiar blunt, curly, knotted kind of foliage. But while these Canterbury capitals are as unlike as possible to Norman types, they show no suggestion whatsoever of the new English type. They are low and broad rather than elongated; the abacus is always *rectangular*; and the beautifully rich and varied and delicate ornamentation shows forms that are distinctly continental, often palpably classic in suggestion, sometimes definitely Corinthianesque. In short, these are *French* capitals in the full sense of the word. One seldom sees their like elsewhere in England; never so profusely and consistently used as here. Even English William did not

diverge in this particular from the example of his predecessor, though in certain other ways (especially when he reached the corona) his details were different — lighter and richer and more insular in accent. But the general effect of the work throughout the choir remains distinctly French. It is a work to be set in comparison with Sens and other Gallic churches of the time, and simply in contrast with those that show a similar stage of development in England. And its early date, together with its free and accomplished use of the pointed arch, are decisive proof of French precedence in the working-out of those fashions we call Gothic.

Few better examples can be found in any land of the use of the pointed arch ere it had finally driven its rival from the field. The presence of the old Norman outer walls meant the existence in the aisles of round-headed windows and arcades; and though the scheme of the two Williams relies in general upon the new device, it retains sufficient semicircles to bring the whole into perfect keeping. The great pier-arches are pointed almost throughout their line, but varied (curiously enough, far to the eastward, in the work of the second William) by two round openings on either

hand, one wider and one narrower in span. The lights of the triforium-arcade are pointed also, but grouped in twos beneath comprising semicircles; the clere-story windows are pointed once again; and the vaulting shows a wise and charming mixture of both forms. Nowhere is there any disharmony; nowhere does contrast become conflict. Even the singular break in the great main arcade between central and side alleys contents the eye more wholly than might be thought.

Two things however do strike us as characteristically English in this choir. One is its immense length and the other is the comparative lowness of its roof. But the latter impression results not so much from any great divergence from current French dimensions as from the gradual but conspicuous elevation of the floor.

Like the nave, the choir now owes its beauty almost solely to the architect's hand,—to the vastness and the harmonious shaping of its plan; to the strong grace of its design; to the almost classic charm, yet truly mediæval variety, of its carven ornament; and to the contrasting colors of its actual materials: pale yellowish stone for the greater part, with dark

more nearly than them all, that where lies the effigy and where hangs the armor of Edward the Black Prince. But none the less it is difficult to conceive what must once have been the crowded pictorial glamour, the eloquent story-telling of the place. Nor is the tramping verger with his apathetic Philistine band a very suggestive substitute for that enormous throng which once ascended the aisle-stairways on its knees; paused by the various chapels to pay homage to the arm of St. George, to a piece of the clay from which Adam was molded, to the bloody pocket-handkerchief of Becket, and to four hundred other relics of equal preciousness and au-

THE SOUTH SIDE OF THE CATHEDRAL.

marble for the slenderer shafts. A few of its tall windows still keep their gorgeous figured glass, and its endless array of tombs, rivaling once the Westminster of to-day, is still represented by a noble if fragmentary sequence. One may still see the sepulcher of Henry IV., of Cardinal Pole, and many another famous primate; and, touching vague retrospective sentiment

thenticity; and knelt around the lofty shrine of St. Thomas in awed awaiting of the moment when its wooden cover should be raised and all its blaze of gold and jewels shown—scintillating in the midst of them that priceless gem, the “Regale of France,” which had leaped from the ring of the seventh Louis and fixed itself in the sepulcher when he had re-

fused it as a gift. The wealth, the dazzle, the incomparable pomp of such a show and the proud self-complacency of the ecclesiastical showmen may well have impressed the average mortal, even at that late day when Erasmus and Colet made their visit and were disgusted to the point of audible outbreak alike by show and showmen and popular abasement.

IX.

THERE is no pure Early English work in this cathedral; and Decorated work has no

most insensibly into the vaulting ribs above, their capitals being insignificant indeed. The triforium has lost its old height, its old character, almost its existence—is but the continuation over an unpierced wall of the tracery of the great window which fills the whole width of the clere-story space above; and all horizontal accentuation disappears in the preponderance of vertical. But so much work of the wonderfully prolific Perpendicular period will meet us elsewhere, that at Canterbury it may be passed over more quickly than the rest. In the same style, but nearly a century later

THE EAST END OF THE CATHEDRAL.

share in its actual construction, though the screen which surrounds the "singers' choir"—separating the central alley just eastward of the crossing from the aisles on either hand—is an exquisite example of thirteenth-century art. When we pass from the choir out into the nave again, we go at one step from twelfth-century Transitional design—French, too, in its flavor—to Perpendicular of the fourteenth century. The change is great indeed. There we had strong piers, winning grace at times from slender flanking shafts of marble; square capitals, conspicuous and elaborate; a high and open triforium-arcade; a clere-story with tall simple lights; and repeated string-courses to emphasize each division. Here the pier-arches are much loftier and of course the aisles beyond are higher too. The pillars are almost like vast bundles of reeds, and pass al-

in date, is the Lady-Chapel, now called the Dean's, which projects eastward from the Transept of the Martyrdom.

X.

No crypt in the world, I should judge, is so stupendous as Canterbury's or so interesting either structurally or historically. As is usual it begins just eastward of the crossing, leaving the four great piers which support the tower to be assisted by the solid earth; and thence it extends to the east as far as the great choir reaches, following the same outlines with transepts and chapels of its own. All the western part under the choir proper—the "choir of the singers" and the presbytery and high altar—and under the second transepts was built by Ernulph, Anselm's first architect, doubtless

THE TOWER, FROM THE NORTH-EAST.

with the concealed use of portions of the ancient pre-Norman crypt. Norman architecture shows of course at its sternest and heaviest in such subterranean constructions, which allowed of no great height, demanded little ornamenting of their darkness, and were forced to carry so huge a superincumbent weight. Ernulph's work (which shows the exact extent and outline of the choir that he and Conrad built above) has stumpy colossal columns, plain cubical capitals, and broad gigantic semicircular arches. But between and under these the eye looks into what seems an endless labyrinth where they merge into a lighter, loftier space, growing higher and higher with the gradual rise of the choir-floor above, having sharply pointed arches and slenderer columns, the shafts and capitals of which show richly decorative intentions that were never fully executed.

All this newer portion in the Transitional style lies beneath that part of the choir which was built by William the Englishman. Its design is doubtless his, and not his pred-

ecessor's; and its execution is evidently all his own, for it is much more English than what stands above. Here, where he was quite unfettered, he used the national round abacus on all his columns, to the exclusion of that rectangular type which, in the upper structure, French beginnings had imposed on his artistic conscience. From the dark, low, heavy, tomb-like Norman crypt it is a change indeed to pass to this eastern end with its high ceiling, and its many windows open to the light and air — scarce to be called a crypt at all, rather an undercroft or lower church. The rising levels of Canterbury's choir are as fortunate in effect below as above the ground.

The Norman crypt was dedicated to the Virgin, and her chapel still remains, inclosed by rich late-Gothic screens. Not far off is the chantry endowed by the Black Prince on his wedding-day. And just where the Norman work meets English William's, under the former termination of the Norman choir, is the spot where Becket was first interred. Here lay King Henry through his abject night of penance; here he bared his body to the monkish lash; and hither came the early pilgrims until, in the year 1220, the body was "translated" to its new tomb overhead. Stephen Langton was then at home again from exile, and worked with the young son of his adversary John to organize a spectacle of inimitable pomp and uncalculating hospitality. Princes bore the pall, bishops followed by scores, and the Archbishop of Rheims performed the mass at a temporary altar in the

NORMAN STAIRWAY IN THE CLOSE.

nave where the vast concourse could be accommodated best. So magnificent a pageant had never been seen before, even in that age of shows; and the debt with which it saddled the diocese could not be wholly paid off until the time of Langton's fourth successor!

But passing years brought very different scenes. In the sixteenth century Queen Elizabeth gave the whole crypt for the use of Canterbury's colony of French and Flemish refu-

XI.

SIGNS of foreign influence are also to be traced on the outside of the church, though far less conspicuously than within. A west front, we know, was but rarely treated in England with the honor it invariably received abroad. Here it shows little evidence of well-thought-out design. Its flanking towers have not been made to harmonize with the huge

THE CENTRAL ("BELL HARRY") TOWER, FROM THE "DARK ENTRY" IN THE CLOSE.

gees; the wide dusky central space was filled up with their silk-loom, and the south aisle screened off to serve their religious needs. That constancy to the by-gone which so singularly co-exists with the marked modernness of the English land seems delightfully illustrated when we find the far descendants of these exiles still worshipping in the same strange subterranean place.

Perpendicular window that fills the whole space between them, and the poverty which always comes when doorways are unduly small is exceptionally apparent. The east end speaks more decidedly of France, but gets a local accent through the very low pitch of its outer roof. And almost everything else is English,—the tremendous length of the choir, the comparatively modest elevation of the

THE CATHEDRAL, FROM THE GREEN COURT IN THE CLOSE.

walls throughout, the two pairs of transepts, the size of the central tower, and the design of this and of the western ones as well.

Yet it is only when we have followed along the whole south side (noting on our way that rich Norman work of the eastward transept and of St. Anselm's Chapel which recalls the memory and explains the style of the burned interior), when we have rounded the east end and found the extraordinary picturesque-ness of the northern aspect,—it is only then we realize how truly English Canterbury is.

To the south the Close was narrowed by the nearness of the city's streets, and there was no room to give the dependent structures this, their customary station. But on the north the domain of the monastery extended to the far-off city-wall, and here Lanfranc and many a later prior and bishop made a marvelously great and splendid sequence of green quadrangles and conventual buildings. Henry the Eighth suppressed the convent, deposed the prior, scattered the hundred and fifty monks, and replaced them with the Dean and dozen canons whose representatives still bear rule. The buildings were somewhat damaged at

this time, were left for years to neglect and isolation, and then beaten into pieces by Puritanic hands.

To-day it needs careful study to trace out what they must all have been,—the two immense dormitories; the great infirmary with its nave and aisles and traceried windows and its chapel to complete the resemblance with an imposing church; the vast guest-houses, here for noble, there for more plebeian, and there again for wandering pauper visitors; the tall water-tower; the library, the treasury, the refectory; the stables, granaries, bake-houses, breweries; and all the minor architectural belongings of so numerous a brotherhood devoted to such comfortable living and such lavish hospitality. To-day the great square of the cloisters still stands contiguous to the church itself, chiefly as rebuilt in Perpendicular days but the same in plan and in occasional stones as when Becket passed along it to his death. The adjoining chapter-house is also preserved, but is also a reconstruction—a rectangular apartment of Decorated and of Perpendicular days; beautiful, but much less individual in its interest than the polygonal rooms we shall find elsewhere. Near by, again, is the old water-

CANTERBURY CATHEDRAL, FROM THE RIVER STOUR.

THE CATHEDRAL, FROM THE NORTH.

tower and a great maze of connecting passages and rooms; and then at a distance from all of these, far off to the northward, are a couple of Norman gateways and a most delightful external stair, the only one in the whole of England that remains as built by Norman hands. And scattered everywhere are fragments large and small of many kinds and dates, sometimes rebuilt to meet some alien purpose, sometimes ruins merely.

But ruin in an English spot like this does not mean desolation and abandonment and the lessening of charm. It means a consummate pictorial beauty which to all eyes save the serious student's well replaces architectural perfection. The casual-seeming columns, the isolated tall arcades, the unglazed windows and enigmatical lines of wall—all alike are ivy-covered and flower-beset and embowered in massive foliage and based on broad floors of an emerald turf such as England alone can grow. And above and beyond, as background to the exquisite wide picture, rises the pale-gray mass of the cathedral crowned by its stupendous yet thrice-graceful tower, telling that all is not dead of what was once so living, speaking of the England of our day as in happy harmony again with the England of St. Thomas. If within the church we protest a little against Protestant guardianship, without we are entirely pleased. Ruined or rebuilt though they are, the surroundings of Canterbury seem far more alive as well as far more lovely than do the undisturbed accompaniments of many a continental church where a lingering Catholicism has better kept the interior in its mediæval state. For nature is always young; and whatever his shortcomings in other artistic paths, the Englishman is master in the art of using her materials. Even the modernized dwellings in which Dean and canons dwell—partly formed of very ancient fragments, partly dating from intermediate periods—have a homely, pleasant, “livable” charm one rarely finds elsewhere. And if there is tennis on the

old monks' turf or a tea-party beneath the venerable trees, one is glad as of another item that delights the eye and another link that binds actual life to the life of vanished years.

But, architecturally speaking, we get our best proof of the English character of the church itself from some point of view a little further off. Its vast length and the triumphant domination of its central tower are then first fully comprehended. Nowhere but in England could we see a Gothic central tower in such supremacy; and nowhere one of the same fashion—four-square in outline through all its two hundred and forty-five feet, finished with a parapet and tall angle-pinnacles, and never destined to receive a spire. Such a tower, matched by consonant lower brethren to the westward, overtopping so long and low a church set amidst such great conventional structures and above such leafy masses, apart and distinct enough from the dwellings of laymen for dignity but not for isolation of effect—all these are things one only sees in England, and nowhere in England more perfectly revealed than here.

XII.

A HUNDRED other points might be noted as of peculiar interest in Canterbury's church, and a hundred other facts of curious historic flavor might be quoted from its chronicles. One is especially tempted to dwell upon the proofs of Becket's marvelous renown; to tell how for generations no royal Englishman omitted homage, and how royal strangers came to pay it too—kings and princes many times, more

than once an emperor of the West, and once even an emperor of the East; to recite how Henry V. journeyed hither fresh from Agincourt, how Edward I. hung by the shrine the golden crown of Scotland and was married in the Transept of the Martyrdom, or how Charles V. of Germany, going nowhere else on English soil, yet came here with Henry VIII., each in the spring-time of his youth and pride, to pay the king-defier reverence just before the day of the Field of the Cloth of Gold. And as a set-off to such tributes one would like to describe the visit of the skeptical but philosophic Erasmus and the equally skeptical but far franker Colet; and the final spoiling of the shrine ordered in his later years by the same Henry who had made the pilgrimage with Charles, when two great coffers, needing each some eight strong men to bear it, could hardly hold the gold and gems, and when the lesser valuables filled a train of six and twenty wagons.

Then is there not that long list of archbishops whose beginning was with St. Augustine himself and whose end is not even yet? Were not its representatives for many ages not only first in the rule of the Church, but scarcely second to the king in the ruling of the State — treasurers, chancellors, vice-regents, guardians of princely children, or leaders of the people, or cardinals of Rome, or teachers or martyrs of the new anti-Roman faith? It is a relief to the imagination to recollect, however, that in later mediæval and still more in modern days the name of Canterbury, when coupled with the archiepiscopal title, has often little local bearing.

At the beginning the tie between the archbishop and his titular church and town was close indeed. He was not only primate of all England but bishop of the Kentish land and

prior of Christ Church Convent too; and his life was intimately intertwined with local happenings. But as his power grew and his duties expanded, he could not but think ever more and more of England, ever less and less of Canterbury. The affairs of the convent were passed over to another, and even diocesan matters were practically in humbler hands. Lambeth Palace in London became his chief residence, and when not there he was far more apt to be in some splendid country home than in his Canterbury dwelling. So distinct seemed to be the call for centralization, so useless, even harmful, seemed the separation between the spiritual and the civic centers of the realm, — a separation which had already taken place before London's supremacy was achieved, when Winchester was the royal town, — that the seat of the primacy would certainly have been transferred had not a single happening preserved Canterbury in its rank. This happening was the murder of Becket, involving as it did his canonization and wonder-working, and the sudden rise of Canterbury from a humble provincial town to a place of world-wide fame and quite peculiar sanctity. When Henry the Eighth made his new arrangements its title was too well established to be taken from it. Since the Puritans leveled the old palace with the ground there has in truth been no archiepiscopal residence at Canterbury. But this is an unimportant detail. As the Kentish capital was from the first, so it remains, and so very surely it will remain as long as there is an England and a Christian faith — the city of the mother church. Had all other monuments of Becket perished as utterly as Henry meant they should, this greatest monument, carved from the very constitution of the English state, would still bear him its conspicuous witness.

M. G. van Rensselaer.

LAMBETH PALACE, LONDON.

LOVE SONG.

THE moon shines pale in the Western sky,
Like a pearl set over a brow that blushes;
There is many a homeward bird in the air,
And the hedges thrill with the thrushes.

Though my love be further away from me
Than the East from the West, or the Day
from the Night,
I have turned my face to his dwelling-place,
And I bid him "good-night," "good-night."

Though he less can feel my hurrying breath
Than the tree the bird that lilts on its bough,
Yet since the winds Love's messengers be,
They will bear him my kisses, I trow! —

O moon! shine first on my lips and then
Go shine on the forehead of him I love!
He will dream perchance that an angel's
wing
Has quivered his brow above! —

And sing, ye birds, in his ears the song
My heart is singing within my breast:
It will thrill his heartstrings with ecstasy,
And possess his soul with rest.

Ye too, O fragrance of earth and flower,
And voices of night in May!
Watch near him until in the Eastern field
Blossom the roses of day.

But thou, O wind! lay close on his lips
The kisses thou hast in thy flight,
And he will stir in his sleep, and wake
And whisper — "My heart — good-night."

Amélie Rives.

LITTLE COMPTON.

BY THE AUTHOR OF "UNCLE REMUS," "FREE JOE AND THE REST OF THE WORLD," ETC.

VERY few Southern country towns have been more profitably influenced by the new order of things than Hillsborough in middle Georgia. At various intervals since the war it has had what the local weekly calls "a business boom." The old tavern has been torn down, and in its place stands a new three-story brick hotel, managed by a very brisk young man, who is shrewd enough to advertise in the newspapers of the neighboring towns that he has "special accommodations and special rates for commercial travelers." Although Hillsborough is comparatively a small town, it is the center of a very productive region, and its trade is somewhat important. Consequently, the commercial travelers, with characteristic energy, lose no opportunity of taking advantage of the hospitable invitation of the landlord of the Hillsborough hotel.

Not many years ago a representative of this class visited the old town. He was from the North, and, being much interested in what he saw, was duly inquisitive. Among other things that attracted his attention was

a little one-armed man who seemed to be the life of the place. He was here, there, and everywhere, and wherever he went the atmosphere seemed to lighten and brighten. Sometimes he was flying around town in a buggy. At such times he was driven by a sweet-faced lady whose smiling air of proprietorship proclaimed her to be his wife; but more often he was on foot. His cheerfulness and good humor were infectious. The old men sitting at Perdue's Corner, where they had been gathering for forty years and more, looked up and laughed as he passed; the ladies shopping in the streets paused to chat with him; and even the dry-goods clerks and lawyers, playing chess or draughts under the China-trees that shaded the sidewalks, were willing to be interrupted long enough to exchange jokes with him.

"Rather a lively chap that," said the observant commercial traveler.

"Well, I reckon you won't find no livelier in these diggin's," replied the landlord, to whom the remark was addressed. There was a suggestion of suppressed local pride in his tones. "He's a little chunk of a man, but he's monst'us peart."

PERDUE'S CORNER.

"A colonel, I guess," said the stranger, smiling.

"Oh, no," the other rejoined. "He ain't no colonel, but he'd 'a' made a prime one. It's mighty curious to me," he went on, "that them Yankees up there didn't make him one."

"The Yankees?" inquired the commercial traveler.

"Why, yes," said the landlord. "He's a Yankee, and that lady you seen drivin' him around, she's a Yankee. He courted her here and he married her here. Major Jimmy Bass wanted him to marry her in his house, but Captain Jack Walthall put his foot down and said the weddin' had to be in *his* house; and there's where it was, in that big white house over yander with the hip roof. Yes, sir."

"Oh," said the commercial traveler, with a cynical smile, "he staid down here to keep out of the army. He was a lucky fellow."

"Well, I reckon he was lucky not to get killed," said the landlord, laughing. "He fought with the Yankees, and they do say that Little Compton was a rattler."

The commercial traveler gave a long, low whistle expressive of his profound astonishment. And yet, under all the circumstances, there was nothing to create astonishment. The lively little man had a history.

Among the genial and popular citizens of Hillsborough, in the days before the war, none were more genial or more popular than Little Compton. He was popular with all classes, with old and with young, with whites and with blacks. He was sober, discreet, sympathetic, and generous. He was neither handsome nor magnetic. He was awkward and somewhat bashful, but his manners and his conversation had the rare merit of spontaneity. His sallow face was unrelieved by either mustache or whiskers, and his eyes were black and very small, but they glistened with good-humor and sociability. He was somewhat small in stature, and for that reason the young men about Hillsborough had given him the name of Little Compton.

Little Compton's introduction to Hillsborough was not wholly without suggestive incidents. He made his appearance there in 1850, and opened a small grocery store; thereupon, the young men of the town, with nothing better to do than to seek such amusement as they could find in so small a community, promptly proceeded to make him the victim of their pranks and practical jokes. Little Compton's forbearance was wonderful. He laughed heartily when he found his modest signboard hanging over an adjacent bar-room, and smiled good-humoredly when he found the sidewalk

in front of his door barricaded with barrels and dry-goods boxes. An impatient man would have looked on these things as in the nature of indignities, but Little Compton was not an impatient man.

This went on at odd intervals, until at last the fun-loving young men began to appreciate Little Compton's admirable temper, and then for a season they played their jokes on other citizens, leaving Little Compton entirely unmolested. These young men were boisterous, but good-natured, and they had their own ideas of what constituted fair play. They were ready to fight or to have fun, but in neither case would they willingly take what they considered a mean advantage of a man.

By degrees they warmed to Little Compton. His gentleness won upon them; his patient good-humor attracted them. Without taking account of the matter, the most of them became his friends. This was demonstrated one day when one of the Pulliam boys from Jasper county made some slurring remark about "the little Yankee." As Pulliam was somewhat in his cups, no attention was paid to his remark; whereupon he followed it up with others of a more seriously abusive character. Little Compton was waiting on a customer, but Pulliam was standing in front of his door, and he could not fail to hear the abuse. Young Jack Walthall was sitting in a chair near the door, whittling a piece of white pine. He put his knife in his pocket, and, whistling softly, looked at Little Compton curiously. Then he walked to where Pulliam was standing.

"If I were you, Pulliam," he said, "and wanted to abuse anybody, I'd pick out a bigger man than that."

"I don't see anybody," said Pulliam.

"Well, d—— you!" exclaimed Walthall, "if you are that blind, I'll open your eyes for you!"

Whereupon he knocked Pulliam down. At this Little Compton ran out excitedly, and it was the impression of the spectators that he intended to attack the man who had been abusing him; but, instead of that, he knelt over the prostrate bully, wiped the blood from his eyes, and finally succeeded in getting him to his feet. Then Little Compton assisted him into the store, placed him in a chair, and proceeded to bandage his wounded eye. Walthall, looking on with an air of supreme indifference, uttered an exclamation of astonishment and sauntered carelessly away.

Sauntering back an hour or so afterward, he found that Pulliam was still in Little Compton's store. He would have passed on, but Little Compton called to him. He went in, prepared to be attacked, for he knew Pulliam to be one of the most dangerous men in that

region and the most revengeful. But, instead of making an attack, Pulliam offered his hand.

"Let's call it square, Jack. Your mother and my father are blood cousins, and I don't want any bad feelings to grow out of this racket. I've apologized to Mr. Compton here, and now I'm ready to apologize to you."

Walthall looked at Pulliam and at his proffered hand, and then looked at Little Compton. The latter was smiling pleasantly. This appeared to be satisfactory, and Walthall seized his kinsman's hand and exclaimed:

"Well, by George, Miles Pulliam! if you've apologized to Little Compton, then it's my turn to apologize to you. Maybe I was too quick with my hands, but that chap there is such a d—— clever little rascal that it works me up to see anybody pester him."

"Why, Jack," said Compton, his little eyes glistening, "I'm not such a scrap as you make out. It's just your temper, Jack; your temper runs clean away with your judgment."

"My temper! Why, good Lord, man! don't I just sit right down and let folks run over me whenever they want to? Would I have done anything if Miles Pulliam had abused *me*?"

"Why, the gilded Queen of Sheba!" exclaimed Miles Pulliam, laughing loudly, in spite of his bruises; "only last sale-day you mighty nigh jolted the life out of Bill-Tom Saunders with the big end of a hickory stick."

"That's so," said Walthall, reflectively; "but did I follow him up to do it? Wasn't he dogging after me all day and strutting around bragging about what he was going to do? Didn't I play the little stray lamb till he rubbed his fist in my face?"

The others laughed. They knew that Jack Walthall wasn't at all lamb-like in his disposition. He was tall and strong and handsome, with pale, classic features, jet-black curling hair, and beautiful white hands that never knew what labor was. He was something of a dandy in Hillsborough, but in a large, manly, generous way. With his perfect manners, stately and stiff, or genial and engaging, as occasion might demand, Mr. Walthall was just such a romantic figure as one reads about in books, or as one expects to see step from behind the wings of the stage with a guitar or a long dagger. Indeed, he was the veritable original of Cyrille Brandon, the hero of Miss Amelia Baxter's elegant novel entitled "*The Haunted Manor*; or, *Souvenirs of the Sunny Southland*." If those who are fortunate enough to possess a copy of this graphic book, which was printed in Charleston for the author, will turn to the description of Cyrille Brandon, they will get a much better idea of Mr. Walthall than they can hope to get in this brief and imperfect chronicle. It is true, the picture there drawn

is somewhat exaggerated to suit the purposes of fictive art, but it shows perfectly the serious impression Mr. Walthall made on the ladies who were his contemporaries.

It is only fair to say, however, that the real Mr. Walthall was altogether different from the ideal Cyrille Brandon of Miss Baxter's powerfully written book. He was by no means ignorant of the impression he made on the fair sex, and he was somewhat proud of it, but he had no romantic ideas of his own. He was, in fact, a very practical young man. When the Walthall estate, composed of thousands of acres of land and several hundred healthy, well-fed negroes, was divided up, he chose to take his portion in money, and this he loaned out at a fair interest to those who were in need of ready cash. This gave him large leisure, and, as was the custom among the young men of leisure, he gambled a little when the humor was on him, having the judgment and the nerve to make the game of poker exceedingly interesting to those who sat with him at table.

No one could ever explain why the handsome and gallant Jack Walthall should go so far as to stand between his own cousin and Little Compton. Indeed, no one tried to explain it. The fact was accepted for what it was worth, and it was a great deal to Little Compton in a social and business way. After the row which has just been described, Mr. Walthall was usually to be found at Compton's store,—in the summer sitting in front of the door under the grateful shade of the China-trees, and in the winter sitting by the comfortable fire that Compton kept burning in his back room. As Mr. Walthall was the recognized leader of the young men, Little Compton's store soon became the headquarters for all of them. They met there and they made themselves at home there, introducing their affable host to many queer antics and capers peculiar to the youth of that day and time, and to the social organism of which that youth was the outcome.

That Little Compton enjoyed their company is unquestionable, but it is doubtful if he entered heartily into the plans of their escapades, which they freely discussed around his hearth. Perhaps it was because he had outlived the folly of youth. Though his face was smooth and round and his eye bright, Little Compton bore the marks of maturity and experience. He used to laugh and say that he was born in New Jersey, and died there when he was young. What significance this statement possessed no one ever knew—probably no one in Hillsborough cared to know. The people of that town had their own notions and their own opinions. They were not unduly inquisitive, save when their inquisitiveness seemed to take

a political shape, and then it was somewhat aggressive.

There were a great many things in Hillsborough likely to puzzle a stranger. Little Compton observed that the young men, no matter how young they might be, were absorbed in politics. They had the political history of the country at their tongues' ends, and the discussions they carried on were interminable. This interest extended to all classes; the planters discussed politics with their overseers, and lawyers, merchants, tradesmen, and gentlemen of elegant leisure discussed politics with each other. School-boys knew all about the Missouri Compromise, the fugitive-slave law, and States rights. Sometimes the arguments used were more substantial than mere words, but this was only when some old feud was back of the discussion. There was one question, as Little Compton discovered, in regard to which there was no discussion; that question was slavery. It loomed up everywhere and in everything, and was the basis of all the arguments; and yet it was not discussed,—there was no room for discussion. There was but one idea, and that was that slavery must be defended at all hazards and against all enemies. That was the temper of the time, and Little Compton was not long in discovering that of all dangerous issues slavery was the most dangerous.

The young men in their free and easy way told him the story of a wayfarer who once came through that region preaching abolitionism to the negroes. The negroes themselves betrayed him, and he was promptly taken in charge. His body was found afterward hanging in the woods, and he was buried at the expense of the county. Even his name had been forgotten, and his grave was all but obliterated. All these things made an impression on Little Compton's mind. The tragedy itself was recalled by one of the pranks of the young men that was conceived and carried out under his eyes. It happened after he had become well used to the ways of Hillsborough. There came a stranger to the town whose queer acts excited the suspicions of a naturally suspicious community. Professedly he was a colporteur, but, instead of trying to dispose of books and tracts, of which he had a visible supply, he devoted himself to arguing with the village politicians under the shade of the trees. It was observed, also, that he would frequently note down observations in a memorandum-book. Just about that time the controversy between the slave-holders and the abolitionists was at its height. John Brown had made his raid on Harper's Ferry, and there was a good deal of excitement throughout the South. It was rumored that Brown had emissaries

traveling from State to State preparing the negroes for insurrection, and every community, even Hillsborough, was on the alert,—watching, waiting, suspecting.

The time assuredly was not auspicious for the stranger with the ready memorandum-book. Sitting in front of Compton's store, he fell into conversation one day with Uncle Abner Lazenberry, a patriarch who lived in the country, and who had a habit of coming to Hillsborough at least once a week to "talk with the boys." Uncle Abner belonged to the poorer class of planters; that is to say, he had a small farm and not more than half a dozen negroes. But he was decidedly popular, and his conversation—somewhat caustic a times—was thoroughly enjoyed by the younger generation. On this occasion he had been talking to Jack Walthall, when the stranger drew a chair within hearing distance.

"You take all your men," Uncle Abner was saying—"take all un 'em, but gimme Hennery Clay. Them abolishmenters, they may come an' git all six er my niggers, if they'll jess but lemme keep the ginnywine ole Whig docterin'. That's me up an' down—that's wher' your Uncle Abner Lazenberry stan's, boys." By this time the stranger had taken out his inevitable note-book, and Uncle Abner went on: "Yes, siree! You may jess mark me down that away. 'Come,' sez I, 'an' take all my niggers an' the ole gray mar', sez I, 'but lemme keep my Whig docterin', sez I. Lord, I've seed sights wi' them niggers. They hain't no manner account. They won't work, an' I'm ablidged to feed 'em, else they'd whirl in an' steal from the neighbors. Hit's about broke me for to maintain 'em in the'r laziness. Bless your soul, little childern! I'm in a turrible fix—a turrible fix. I'm that bankruptured that when I come to town, ef I fine a thrip in my britches-pocket for to buy me a dram I'm the happiest mortal in the county. Yes, siree! hit's got down to that."

Here Uncle Abner Lazenberry paused and eyed the stranger shrewdly, to whom, presently, he addressed himself in a very insinuating tone:

"What mought be your name, mister?"

"Oh," said the stranger, taken somewhat aback by the suddenness of the question, "my name might be Jones, but it happens to be Davies."

Uncle Abner Lazenberry stared at Davies a moment as if amazed, and then exclaimed:

"Jesso! Well, dog my cats ef times hain't a-changin' an' a-changin' tell bimeby the nat-chul world an' all the hummisp'eres 'll make the'r disappearance een'-uppermost. Yit, whiles they er changin' an' a-disappearin', I hope they'll leave me my ole Whig docterin',

an' my name, which the fust an' last un it is Abner Lazenberry. An' more'n that," the old man went on, with severe emphasis,—“an' more'n that, they hain't never been a day sence the creation of the world an' the hummisp'eres when my name mought er been anything else under the shinin' sun but Abner Lazenberry; an' ef the time's done come when any mortal name mought er been anything but what hit reely is, then we jess better turn the nation an' the federation over to demockeracy an' giner'l damnation. Now that's me, right pine-plank."

By way of emphasizing his remarks Uncle Abner brought the end of his hickory cane down upon the ground with a tremendous thump. The stranger reddened a little at the unexpected criticism, and was evidently ill at ease, but he remarked politely:

"This is just a saying I've picked up somewhere in my travels. My name is Davies, and I am traveling through the country selling a few choice books and picking up information as I go."

"I know a mighty heap of Davises," said Uncle Abner, "but I disremember of anybody name Davies."

"Well, sir," said Mr. Davies, "the name is not uncommon in my part of the country. I am from Vermont."

"Well, well!" said Uncle Abner, tapping the ground thoughtfully with his cane. "A mighty fur ways Vermont is, tooby shore. In my day an' time I've seed as many as three men folks from Vermont, an' one un 'em, he wuz a wheelwright, an' one wuz a tin-peddler, an' the yuther one wuz a clock-maker. But that wuz a long time ago. How is the abolishmenters gittin' on up that away, an' when in the name er patience is they a-comin' arter my niggers? Lord! if them niggers wuz free, I wouldn't have to slave for 'em."

"Well, sir," said Mr. Davies, "I take little or no interest in those things. I have to make a humble living, and I leave political questions to the politicians."

The conversation was carried on at some length, the younger men joining in occasionally to ask questions, and nothing could have been friendlier than their attitude toward Mr. Davies. They treated him with the greatest consideration. His manner and speech were those of an educated man, and he seemed to make himself thoroughly agreeable. But that night, as Mr. Jack Walthall was about to go to bed, his body-servant, a negro named Jake, began to question him about the abolitionists.

"What do you know about abolitionists?" Mr. Walthall asked with some degree of severity.

"Nothin' 'tall, Marse Jack, 'cep'in' w'at dish

yer new wite man down dar at de tavern say."

"And what did he say?" Mr. Walthall inquired.

"I ax 'im, I say, 'Marse Boss, is dese yer bobolitionists got horns en huffs?' en he 'low, he did, dat dey ain't no bobolitionists, kaze dey er babolitionists, an' dey ain't got needer horns ner huffs."

"What else did he say?"

Jake laughed. It was a hearty and humorous laugh.

"Well, sir," he replied, "dat man des preached. He sholy did. He ax me ef de niggers 'roun' yer wouldn' all like ter be free, en I tole 'im I don't speck dey would, kaze all de free niggers w'at I ever seed is de mos' no-'countes' niggers in de lan'."

Mr. Walthall dismissed the negro somewhat curtly. He had prepared to retire for the night, but apparently thought better of it, for he resumed his coat and vest and went out into the cool moonlight. He walked around the public square, and finally perched himself on the stile that led over the court-house inclosure. He sat there a long time. Little Compton passed by, escorting Miss Lizzie Fairleigh, the schoolmistress, home from some sociable gathering, and finally the lights in the village went out one by one—all save the one that shone in the window of the room occupied by Mr. Davies. Watching this window somewhat closely, Mr. Jack Walthall observed that there was movement in the room. Shadows played on the white window-curtains—human shadows passing to and fro. The curtains, quivering in the night wind, distorted these shadows and made confusion of them, but the wind died away for a moment, and, outlined on the curtains, the patient watcher saw a silhouette of Jake, his body-servant. Mr. Walthall beheld the spectacle with amazement. It never occurred to him that the picture he saw was part—the beginning, indeed—of a tremendous panorama which would shortly engage the attention of the civilized world, but he gazed at it with a feeling of vague uneasiness.

The next morning Little Compton was somewhat surprised at the absence of the young men who were in the habit of gathering in front of his store. Even Mr. Jack Walthall, who could be depended on to tilt his chair against the China-tree and sit there for an hour or more after breakfast, failed to put in an appearance. After putting his store to rights and posting up some accounts left over from the day before, Little Compton came out on the sidewalk and walked up and down in front of the door. He was in excellent humor, and as he walked he hummed a tune. He did not lack for companionship, for his cat, Tommy Tink-

tums, an extraordinarily large one, followed him back and forth, rubbing against him and running between his legs; but somehow he felt lonely. The town was very quiet. It was quiet at all times, but on this particular morning it seemed to Little Compton that there was less stir than usual. There was no sign of life anywhere around the public square save at Perdue's Corner. Shading his eyes with his hand, Little Compton observed a group of citizens apparently engaged in a very interesting discussion. Among them he recognized the tall form of Mr. Jack Walthall and the somewhat ponderous presence of Major Jimmy Bass. Little Compton watched the group because he had nothing better to do. He saw Major Jimmy Bass bring the end of his cane down upon the ground with a tremendous thump, and gesticulate like a man laboring under strong excitement, but this was nothing out of the ordinary, for Major Jimmy had been known to get excited over the most trivial discussion; on one occasion, indeed, he had even mounted a dry-goods box, and, as the boys expressed it, "cussed out the town."

Still watching the group, Little Compton saw Mr. Jack Walthall take Buck Ransome by the arm and walk across the public square in the direction of the court-house. They were followed by Mr. Alvin Cozart, Major Jimmy Bass, and young Rowan Wornum. They went to the court-house stile and formed a little group, while Mr. Walthall appeared to be explaining something, pointing frequently in the direction of the tavern. In a little while they returned to those they had left at Perdue's Corner, where they were presently joined by a number of other citizens. Once Little Compton thought he would lock his door and join them, but by the time he had made up his mind the group had dispersed.

A little later on Compton's curiosity was more than satisfied. One of the young men, Buck Ransome, came into Compton's store, bringing a queer-looking bundle. Unwrapping it, Mr. Ransome brought to view two large pillows. Whistling a gay tune, he ran his keen knife into one of these, and felt of the feathers. His manner was that of an expert. The examination seemed to satisfy him, for he rolled the pillows into a bundle again and deposited them in the back part of the store.

"You'd be a nice housekeeper, Buck, if you did all your pillows that way," said Compton.

"Why, bless your great big soul, Compy," said Mr. Ransome, striking an attitude, "I'm the finest in the land."

Just then Mr. Alvin Cozart came in, bearing a small bucket, which he handled very carefully. Little Compton thought he detected the odor of tar.

"IS DESE YER BOBOLITIONISTS GOT HORNS EN HUFFS?"

"Stick her in the back room there," said Mr. Ransome; "she'll keep."

Compton was somewhat mystified by these proceedings, but everything was made clear when, an hour later, the young men of the town, reënforced by Major Jimmy Bass, marched into his store, bringing with them Mr. Davies, the Vermont colporteur who had been flourishing his note-book in the faces of the inhabitants. Jake, Mr. Walthall's body-servant, was prominent in the crowd by reason of his color and his frightened appearance. The colporteur was very pale, but he seemed to be cool. As the last one filed in, Mr. Walthall stepped to the front door and shut and locked it. Compton was too amazed to say anything. The faces before him, always so full of humor and fun, were serious enough now. As the key turned in the lock the colporteur found his voice.

"Gentlemen!" he exclaimed with some show of indignation, "what is the meaning of this? What would you do?"

"You know mighty well, sir, what we ought to do," cried Major Bass. "We ought to hang you, you imperdent scoundler! A-comin' down

here a-pesterin' an' a-meddlin' with tother people's business."

"Why, gentlemen," said Davies, "I'm a peaceable citizen; I trouble nobody. I am simply traveling through the country selling books to those who are able to buy, and give ing them away to those who are not."

"Mr. Davies," said Mr. Jack Walthall, leaning gracefully against the counter, "what kind of books are you selling?"

"Religious books, sir."

"Jake!" exclaimed Mr. Walthall somewhat sharply, so sharply, indeed, that the negro jumped as though he had been shot. "Jake! stand out there. Hold up your head, sir! Mr. Davies, how many religious books did you sell to that nigger there last night?"

"I sold him none, sir; I —"

"How many did you *try* to sell him?"

"I made no attempt to sell him any books; I knew he couldn't read. I merely asked him to give me some information."

Major Jimmy Bass scowled dreadfully, but Mr. Jack Walthall smiled pleasantly, and turned to the negro.

"Jake! do you know this man?"

"W'AT AIL' YOU ALL W'ITE FOLKS NOW?"

"I seed 'im, Marse Jack; I des seed 'im; dat's all I know 'bout 'im."

"What were you doing sasshaying around in his room last night?"

Jake scratched his head, dropped his eyes, and shuffled about on the floor with his feet. All eyes were turned on him. He made so long a pause that Alvin Cozart remarked in his drawling tone:

"Jack, hadn't we better take this nigger over to the calaboose?"

"Not yet," said Mr. Walthall, pleasantly. "If I have to take him over there I'll not bring him back in a hurry."

"I wuz des up in his room kaze he tole me fer ter come back en see 'im. Name er God, Marse Jack, w'at ail' you all w'ite folks now?"

"What did he say to you?" asked Mr. Walthall.

"He ax me w'at make de niggers stay in

slave'y," said the frightened negro; "he ax me w'at de reason dey don't git free deyse'f."

"He was warm after information," Mr. Walthall suggested.

"Call it what you please," said the Vermont colporteur. "I asked him those questions and more." He was pale, but he no longer acted like a man troubled with fear.

"Oh, we know that, mister," said Buck Ransome. "We know what you come for, and we know what you're goin' away for. We'll excuse you if you'll excuse us, and then there'll be no hard feelin's—that is, not many; none to growl about. Jake, hand me that bundle there on the barrel, and fetch that tar-bucket. You've got the makin' of a mighty fine bird in you, mister," Ransome went on, addressing the colporteur; "all you lack's the feathers, and we've got oodles of 'em right here. Now, will you shuck them duds?"

For the first time the fact dawned on Little Compton's mind that the young men were about to administer a coat of tar and feathers to the stranger from Vermont, and he immediately began to protest.

"Why, Jack," said he, "what has the man done?"

"Well," replied Mr. Walthall, "you heard what the nigger said. We can't afford to have these abolitionists preaching insurrection right in our back yards. We just can't afford it, that's the long and short of it. Maybe you don't understand it; maybe you don't feel as we do; but that's the way the matter stands. We are in a sort of a corner, and we are compelled to protect ourselves."

"I don't believe in no tar and feathers for this chap," remarked Major Jimmy Bass, assuming a judicial air. "He'll just go out here to the town branch and wash 'em off, and then he'll go on through the plantations raising h—— among the niggers. That'll be the upshot of it—now, you mark my words. He ought to be hung."

"Now, boys," said Little Compton, still protesting, "what is the use? This man hasn't done any real harm. He might preach insurrection around here for a thousand years, and the niggers wouldn't listen to him. Now, you know that yourselves. Turn the poor devil loose, and let him get out of town. Why, haven't you got any confidence in the niggers you've raised yourselves?"

"My dear sir," said Rowan Wornum, in his most insinuating tone, "we've got all the confidence in the world in the niggers, but we can't afford to take any risks. Why, my dear sir," he went on, "if we let this chap go, it won't be six months before the whole country'll be full of this kind. Look at that Harper's Ferry business."

"Well," said Compton somewhat hotly, "look at it. What harm has been done? Has there been any nigger insurrection?"

Jack Walthall laughed good-naturedly. "Little Compton is a quick talker, boys. Let's give the man the benefit of all the arguments."

"Great God! You don't mean to let this d—— rascal go, do you, Jack?" exclaimed Major Jimmy Bass.

"No, no, sweet uncle; but I've got a nicer dose than tar and feathers."

The result was that the stranger's face and hands were given a coat of lampblack, his arms were tied to his body, and a large placard was fastened to his back. The placard bore this inscription:

<p>ABOLITIONIST! PASS HIM ON, BOYS.</p>

Mr. Davies was a pitiful-looking object after the young men had plastered his face and hands with lampblack and oil, and yet his appearance bore a certain queer relation to the humorous exhibitions one sees on the negro minstrel stage. Particularly was this the case when he smiled at Compton.

"By George, boys!" exclaimed Mr. Buck Ransome, "this chap could play Old Bob Ridley at the circus."

When everything was arranged to suit them, the young men formed a procession and marched the blackened stranger from Little Compton's door into the public street. Little Compton seemed to be very much interested in the proceeding. It was remarked afterward that he seemed to be very much agitated, and that he took a position very near the placarded abolitionist. The procession, as it moved up the street, attracted considerable attention. Rumors that an abolitionist was to be dealt with had apparently been circulated, and a majority of the male inhabitants of the town were out to view the spectacle. The procession passed entirely around the public square, of which the court-house was the center, and then across the square to the park-like inclosure that surrounded the temple of justice.

As the young men and their prisoner crossed this open space, Major Jimmy Bass, fat as he was, grew so hilarious that he straddled his cane, as children do broomsticks, and pretended that he had as much as he could do to hold his fiery wooden steed. He waddled and pranced out in front of the abolitionist, and turned and faced him, whereat his steed showed the most violent symptoms of running away. The young men roared with laughter, and the spectators roared with them, and even the abolitionist laughed. All laughed but Little Compton. The procession was marched to the court-house inclosure, and there the prisoner was made to stand on the sale-block so that all might have a fair view of him. He was kept there until the stage was ready to go, and then he was given a seat on that swaying vehicle and forwarded to Rockville, where, presumably, the "boys" placed him on the train and "passed him on" to the "boys" in other towns.

For months thereafter there was peace in Hillsborough, so far as the abolitionists were concerned, and then came the secession movement. A majority of the citizens of the little town were strong Union men, but the secession movement seemed to take even the oldest off their feet, and by the time the Republican President was inaugurated, the Union sentiment that had marked Hillsborough had practically disappeared. In South Carolina companies of minute-men had been formed, and the

entire white male population was wearing blue cockades. With some modifications, these symptoms were reproduced in Hillsborough. The modifications were that a few of the old men still stood up for the Union and that some of the young men, though they wore the blue cockade, did not align themselves with the minute-men.

Little Compton took no part in these proceedings. He was discreetly quiet. He tended his store and smoked his pipe and watched events. One morning he was aroused from his slumbers by a tremendous crash—a crash that rattled the windows of his store and shook its very walls. He lay quiet awhile, thinking that a small earthquake had been turned loose on the town. Then the crash was repeated, and he knew that Hillsborough was firing a salute from its little six-pounder, a relic of the Revolution that had often served the purpose of celebrating the nation's birthday in a noisily becoming manner.

Little Compton arose and dressed himself, and prepared to put his store in order. Issuing forth into the street, he saw that the town was in considerable commotion. A citizen who had been in attendance on the convention at Milledgeville had arrived during the night bringing the information that the ordinance of secession had been adopted and that Georgia was now a sovereign and independent government. The original secessionists were in high feather, and their hilarious enthusiasm had its effect on all save a few of the Union men.

Early as it was, Little Compton saw two flags floating from an improvised flagstaff on top of the court-house. One was the flag of the State, with its pillars, its sentinel, and its legend of "Wisdom, Justice, and Moderation." The design of the other was entirely new to Little Compton. It was a pine-tree on a field of white, with a rattlesnake coiled at its roots, and the inscription, "DON'T TREAD ON ME!" A few hours later Uncle Abner Lazeberry made his appearance in front of Compton's store. He had just hitched his horse to the rack near the court-house.

"Merciful heavens!" he exclaimed, wiping his red face with a red handkerchief, "is the Ole Boy done gone an' turned hisself loose?"

LITTLE COMPTON.

I hearn the racket, an' I sez to the ole woman, sez I, 'I'll fling the saddle on the gray mar' an' canter to town an' see what in the dingnation the matter is. An' ef the worl's about to fetch a lurch, I'll git me another dram an' die happy,' sez I. Whar's Jack Walthall? He can tell his Uncle Abner all about it."

"Well, sir," said Little Compton, "the State has seceded, and the boys are celebrating."

"I know'd it," cried the old man angrily. "My min' tole me so." Then he turned and looked at the flags flying from the top of the court-house. "Is them rags the things they er gwine to fly out'n the Union with?" he exclaimed scornfully. "Why, bless your soul an' body, hit'll take bigger wings than them! Well, sir, I'm sick; I am that away. I wuz born in the Union, an' I'd like mighty well to die thar. Ain't it mine? ain't it our'n? Jess as shore as you're born, thar's trouble ahead—big trouble. You're from the North, ain't you?" Uncle Abner asked, looking curiously at Little Compton.

"Yes, sir, I am," Compton replied; "that is, I am from New Jersey, but they say New Jersey is out of the Union."

Uncle Abner did not respond to Compton's smile. He continued to gaze at him significantly.

"Well," the old man remarked somewhat bluntly, "you better go back where you come

from. You ain't got nothin' in the roun' worl' to do with all this hellabaloo. When the pinch comes, as come it must, I'm jess gwine to swap a nigger for a sack er flour an' settle down; but you had better go back where you come from."

Little Compton knew the old man was friendly, but his words, so solemnly and significantly uttered, made a deep impression. The words recalled to Compton's mind the spectacle of the man from Vermont who had been paraded through the streets of Hillsborough, with his face blackened and a placard on his back. The little Jerseyman also recalled other incidents, some of them trifling enough, but all of them together going to show the hot temper of the people around him, and for a day or two he brooded rather seriously over the situation. He knew that the times were critical.

For several weeks the excitement in Hillsborough, as elsewhere in the South, continued to run high. The blood of the people was at fever heat. The air was full of the portents and premonitions of war. Drums were beating, flags were flying, and military companies were parading. Jack Walthall had raised a company, and it had gone into camp in an old field near the town. The tents shone snowy white in the sun, the uniforms of the men were bright and gay, and the boys thought this was war. But, instead of that, they were merely enjoying a holiday. The ladies of the town sent them wagon loads of provisions every day, and the occasion was a veritable picnic—a picnic that some of the young men remembered a year or two later when they were trudging, ragged, barefooted, and hungry, through the snow and slush of a Virginia winter.

But, with all their drilling and parading in the peaceful camp at Hillsborough, the young men had many idle hours, and they devoted these to various forms of amusements. On one occasion, after they had exhausted their ingenuity in search of entertainment, one of them, Lieutenant Buck Ransome, suggested that it might be interesting to get up a joke on Little Compton.

"But how?" asked Lieutenant Cozart.

"Why, the easiest in the world," said Lieutenant Ransome. "Write him a note, and tell him that the time has come for an English-speaking people to take sides, and fling in a kind of side-wiper about New Jersey."

Captain Jack Walthall, leaning comfortably against a huge box that was supposed to bear some relation to a camp-chest, blew a cloud of smoke through his sensitive nostrils and laughed. "Why, stuff, boys!" he exclaimed somewhat impatiently, "you can't scare Little Compton. He's got grit and it's the right kind of grit. Why, I'll tell you what's a fact,—the

sand in that man's gizzard would make enough mortar to build a fort."

"Well, I'll tell you what we'll do," said Lieutenant Ransome. "We'll sling him a line or two, and if it don't stir him up, all right; but if it does, we'll have some tall fun."

Whereupon, Lieutenant Ransome fished around in the chest and drew forth pen and ink and paper. With some aid from his brother officers he managed to compose the following:

"LITTLE MR. COMPTON — Dear Sir: The time has arrived when every man should show his colors. Those who are not for us are against us. Your best friends, when asked where you stand, do not know what to say. If you are for the North in this struggle, your place is at the North. If you are for the South, your place is with those who are preparing to defend the rights and liberties of the South. A word to the wise is sufficient. You will hear from me again in due time.

"NEMESIS."

This was duly sealed and dropped in the Hillsborough post-office, and Little Compton received it the same afternoon. He smiled as he broke the seal, but ceased to smile when he read the note. It happened to fit a certain vague feeling of uneasiness that possessed him. He laid it down on his desk, walked up and down behind his counter, and then returned and read it again. The sprawling words seemed to possess a fascination for him. He read them again and again, and turned them over and over in his mind. It was characteristic of his simple nature that he never once attributed the origin of the note to the humor of the young men with whom he was so familiar. He regarded it seriously. Looking up from the note, he could see in the corner of his store the brush and pot that had been used as arguments on the Vermont abolitionist. He vividly recalled the time when that unfortunate person was brought up before the self-constituted tribunal that assembled in his store.

Little Compton thought he had gauged accurately the temper of the people about him, and he had, but his modesty prevented him from accurately gauging, or even thinking about, the impression he had made on them. The note troubled him a good deal more than he would at first confess to himself. He seated himself on a low box behind his counter to think it over, resting his face in his hands. A little boy who wanted to buy a thrip's worth of candy went slowly out again after trying in vain to attract the attention of the hitherto prompt and friendly store-keeper. Tommy Tinktums, the cat, seeing that his master was sitting down, came forward with the expectation of being told to perform his famous "bouncing" trick, a feat that was at once the wonder and delight of the youngsters around Hillsborough. But Tommy Tinktums was not commanded to bounce, and so he contented himself with wash-

ing his face, pausing every now and then to watch his master with half-closed eyes.

While sitting thus reflecting, it suddenly occurred to Little Compton that he had had very few customers during the past several days, and it seemed to him, as he continued to think the matter over, that the people, especially the young men, had been less cordial lately than they had ever been before. It never occurred to him that the threatened war and the excitement of the period occupied their entire attention. He simply remembered that the young men who had made his modest little store their headquarters met there no more. Little Compton sat behind his counter a long time thinking. The sun went down and the dusk fell and the night came on and found him there.

After a while he lit a candle, spread the communication out on his desk, and read it again. To his mind there was no mistaking its meaning. It meant that he must either fight against the Union or array against himself all the bitter and aggressive suspicion of the period. He sighed heavily, closed his store, and went out into the darkness. He made his way to the residence of Major Jimmy Bass, where Miss Lizzie Fairleigh boarded. The major himself was sitting on the veranda, and he welcomed Little Compton with effusive hospitality — a hospitality that possessed an old-fashioned flavor.

"I'm mighty glad you come — yes, sir, I am. It looks like the whole world's out at the camps, and it makes me feel sorter lonesome. Yes, sir; it does that. If I wasn't so plump I'd be out there too. It's a mighty good place to be about this time of the year. I tell you what, sir, them boys is got the devil in 'em. Yes, sir; there ain't no two ways about that. When they turn themselves loose, somebody or something will git hurt. Now, you mark what I tell you. It's a tough lot — a mighty tough lot. Lord! wouldn't I hate to be a Yankee and fall in their hands! I'd be glad if I had time for to say my prayers. Yes, sir; I would that."

Thus spoke the cheerful Major Bass, and every word he said seemed to rhyme with Little Compton's own thoughts and to confirm the fears that had been aroused by the note. After he had listened to the major awhile Little Compton asked for Miss Fairleigh.

"Oho!" said the major. Then he called to a negro who happened to be passing through the hall, "Jesse, tell Miss Lizzie that Mr. Compton is in the parlor." Then he turned to Compton. "I tell you what, sir, that gal looks mighty puny. She's from the North, and I reckon she's homesick. And then there's all this talk about war. She knows our boys'll eat the Yankees plum up, and I don't blame her for being sorter downhearted. I wish you'd

try to cheer her up. She's a good gal if there ever was one on the face of the earth."

Little Compton went into the parlor, where he was presently joined by Miss Fairleigh. They talked a long time together, but what they said no one ever knew. They conversed in low tones, and once or twice the hospitable major, sitting on the veranda, detected himself trying to hear what they said. He could see them from where he sat, and he observed that both appeared to be profoundly dejected. Not once did they laugh, or, so far as the major could see, even smile. Occasionally Little Compton arose and walked the length of the parlor, but Miss Fairleigh sat with bowed head. It may have been a trick of the lamp, but it seemed to the major that they were both very pale.

Finally, Little Compton rose to go. The major observed with a chuckle that he held Miss Fairleigh's hand a little longer than was strictly necessary under the circumstances. He held it so long, indeed, that Miss Fairleigh half averted her face, but the major noted that she was still pale. "We shall have a wedding in this house before the war opens," he thought to himself, and his mind was dwelling on such a contingency when Little Compton came out on the veranda.

"Don't tear yourself away in the heat of the day," said Major Bass, jocularly.

"I must go," replied Compton. "Good-bye!" He seized the major's hand and wrung it.

"Good-night," said the major, "and God bless you!"

The next day was Sunday. But on Monday it was observed that Compton's store was closed. Nothing was said and little thought of it. People's minds were busy with other matters. The drums were beating, the flags flying and the citizen soldiery parading. It was a noisy and exciting time, and a larger store than Little Compton's might have remained closed for several days without attracting attention. But one day, when the young men from the camp were in the village, it occurred to them to inquire what effect the anonymous note had had on Little Compton. Whereupon they went in a body to his store, but the door was closed, and they found it had been closed a week or more. They also discovered that Compton had disappeared.

This had a very peculiar effect upon Captain Jack Walthall. He took off his uniform, put on his citizen's clothes, and proceeded to investigate Compton's disappearance. He sought in vain for a clew. He interested others to such an extent that a great many people in Hillsborough forgot all about the military situation. But there was no trace of Little Compton. His store was entered from a rear window,

and everything found to be intact. Nothing had been removed. The jars of striped candy that had proved so attractive to the youngsters of Hillsborough stood in long rows on the shelves, flanked by the thousand and one notions that make up the stock of a country grocery store. Little Compton's disappearance was a mysterious one, and under ordinary circumstances would have created intense excitement in the community, but at that particular time the most sensational event would have seemed tame and commonplace alongside the preparations for war.

Owing probably to a lack of the faculty of organization at Richmond — a lack which, if we are to believe the various historians who have tried to describe and account for some of the results of that period, was the cause of many bitter controversies, and of many disastrous failures in the field — a month or more passed away before the Hillsborough company received orders to go to the front. Fort Sumter had been fired on, troops from all parts of the South had gathered in Virginia, and the war was beginning in earnest. Captain Jack Walthall, of the Hillsborough Guards, chafed at the delay that kept his men resting on their arms, so to speak, but he had ample opportunity, meanwhile, to wonder what had become of Little Compton. In his leisure moments he often found himself sitting on the dry-goods boxes in the neighborhood of Little Compton's store. Sitting thus one day, he was approached by his body-servant. Jake had his hat in his hand and showed by his manner that he had something to say. He shuffled around, looked first one way and then another, and scratched his head.

"Marse Jack," he began.

"Well, what is it?" said the other, somewhat sharply.

"Marse Jack, I hope ter de Lord you ain't gwine ter git mad wid me; yit I mos' knows you is, kaze I oughter done tole you a long time ago."

"You ought to have told me what?"

"'Bout my drivin' yo' hoss en buggy over ter Rockville dat time — dat time what I ain't never tole you 'bout. But I 'uz mos' 'blige' ter do it. I 'low ter myse'f, I did, dat I oughter come tell you right den, but I 'uz skeer'd you mought git mad, en den you wuz out dar at de camps, 'long wid dem milliumterry folks."

"What have you got to tell?"

"Well, Marse Jack, des 'bout takin' yo' hoss en buggy. Marse Compton 'lowed you wouldn't keer, en w'en he say dat, I des went en hitch up de hoss en kyar'd 'im over ter Rockville."

"What under heaven did you want to go to Rockville for?"

"Who? me, Marse Jack? 'Twa'n't me wanter go. Hit 'uz Marse Compton."

"Little Compton?" exclaimed Walthall.

"Yes, sir — dat ve'y same man."

"What did you carry Little Compton to Rockville for?"

"Fo' de Lord, Marse Jack, I dunno w'at Marse Compton wanter go fer. I des know'd I'uz doin' wrong, but he tuck'n 'low' dat hit'd be all right wid you, kaze you bin knowin' him so monst'us well. En den he up'n ax me not to tell you twell he done plum out'n yearin'."

"Didn't he say anything? Didn't he tell you where he was going? Didn't he send any word back?"

This seemed to remind Jake of something. He clapped his hand to his head and exclaimed:

"Well, de Lord he'p my soul! Ef I ain't de beatenest nigger on de top side er de yeth! Marse Compton gun me a letter, en I tuck'n shove it un' de buggy seat, en it's right dar yit ef somebody ain't tored it up."

By certain well-known signs Jake knew that his Marse Jack was very mad, and he was hurrying out. But Walthall called him.

"Come here, sir!" The tone made Jake tremble. "Do you stand up there, sir, and tell me all this, and think I am going to put up with it?"

"I'm gwine after dat note, Marse Jack, des ez hard ez ever I kin."

Jake managed to find the note after some little search, and carried it to Jack Walthall. It was crumpled and soiled. It had evidently seen rough service under the buggy seat. Walthall took it from the negro, turned it over and looked at it. It was sealed, and addressed to Miss Lizzie Fairleigh.

Jack Walthall arrayed himself in his best and made his way to Major Jimmy Bass's, where he inquired for Miss Fairleigh. That young lady promptly made her appearance. She was pale and seemed to be troubled. Walthall explained his errand and handed her the note. He thought her hand trembled, but he may have been mistaken, as he afterward confessed. She read it, and handed it to Captain Walthall with a vague little smile that would have told him volumes if he had been able to read the feminine mind.

Major Jimmy Bass was a wiser man than Walthall, and he remarked long afterward that he knew by the way the poor girl looked that she was in trouble, and it is not to be denied — at least, it is not to be denied in Hillsborough, where he was known and respected — that Major Bass's impressions were as important as the average man's convictions. This is what Captain Jack Walthall read:

"DEAR MISS FAIRLEIGH: When you see this I shall be on my way home. My eyes have recently been opened to the fact that there is to be a war for and

against the Union. I have strong friendships here, but I feel that I owe a duty to the old flag. When I bade you good-bye last night, it was good-bye forever. I had hoped — I had desired — to say more than I did; but perhaps it is better so. Perhaps it is better that I should carry with me a fond dream of what might have been, than to have been told by you that such a dream could never come true. I had intended to give you the highest evidence of my respect and esteem that man can give to woman, but I have been overruled by fate or circumstance. I shall love you as long as I live. One thing more: should you ever find yourself in need of the services of a friend,— a friend in whom you may place the most implicit confidence,— send for Mr. Jack Walthall. Say to him that Little Compton commended you to his care and attention, and give him my love."

Walthall drew a long breath and threw his head back as he finished reading this. Whatever emotion he may have felt he managed to conceal, but there was a little color in his usually pale face, and his dark eyes shone with a new light.

"This is a very unfortunate mistake," he exclaimed. "What is to be done?"

Miss Fairleigh smiled.

"There is no mistake, Mr. Walthall," she replied. "Mr. Compton is a Northern man, and he has gone to join the Northern army. I think he is right."

"Well," said Walthall, "he will do what he thinks is right, but I wish he was here to-night."

"Oh, so do I!" exclaimed Miss Fairleigh, and then she blushed; seeing which, Mr. Jack Walthall drew his own conclusions.

"If I could get through the lines," she went on, "I would go home." Whereupon Walthall offered her all the assistance in his power, and offered to escort her to the Potomac. But before arrangements for the journey could be made there came the news of the first battle of Manassas, and the conflict was begun in earnest; so earnest, indeed, that it changed the course of a great many lives, and gave even a new direction to American history.

Miss Fairleigh's friends in Hillsborough would not permit her to risk the journey through the lines, and Captain Walthall's company was ordered to the front, where the young men composing it entered headlong into the hurly-burly that goes by the name of war.

There was one little episode growing out of Jack Walthall's visit to Miss Fairleigh that ought to be told. When that young gentleman bade her good evening, and passed out of the parlor, Miss Fairleigh placed her hands to her face and fell to weeping, as women will.

Major Bass, sitting on the veranda, had been an interested spectator of the conference in the parlor, but it was in the nature of a pantomime. He could hear nothing that was said, but he could see that Miss Fairleigh

and Walthall were both laboring under some strong excitement. When, therefore, he saw Walthall pass hurriedly out, leaving Miss Fairleigh in tears in the parlor, it occurred to him that, as the head of the household and the natural protector of the women under his roof, he was bound to take some action. He called Jesse, the negro house-servant, who was on duty in the dining-room.

"Jess! Jess! Oh, Jess!" There was an insinuating sweetness in his voice, as it echoed through the hall. Jesse, doubtless recognizing the velvety quality of the tone, made his appearance promptly. "Jess," said the major, softly, "I wish you'd please fetch me my shot-gun. Make 'aste, Jess, and don't make no furse."

Jesse went after the shot-gun, and the major waddled into the parlor. He cleared his throat at the door, and Miss Fairleigh looked up.

"Miss Lizzie, did Jack Walthall insult you here in my house?"

"Insult me, sir! Why, he's the noblest gentleman alive."

The major drew a deep breath of relief, and smiled.

"Well, I'm mighty glad to hear you say so!" he exclaimed. "I couldn't tell, to save my life, what put it into my mind. Why, I might 'a' know'd that Jack Walthall ain't that kind of a chap. Lord! I reckon I must be getting old and weak-minded. Don't cry no more, honey. Go right along and go to bed." As he turned to go out of the parlor he was confronted by Jesse with the shot-gun. "Oh, go put her up, Jess," he said apologetically; "go put her up, boy. I wanted to blaze away at a dog out there trying to scratch under the palings; but the dog's done gone. Go put her up, Jess."

When Jess carried the gun back, he remarked casually to his mistress:

"Miss Sa'h, you better keep yo' eye on Marse Maje. He talkin' mighty funny, en he doin' mighty quare."

Thereafter, for many a long day, the genial major sat in his cool veranda and thought of Jack Walthall and the boys in Virginia. Sometimes between dozes he would make his way to Perdue's Corner, and discuss the various campaigns. How many desperate campaigns were fought on that Corner! All the older citizens, who found it convenient or necessary to stay at home, had in them the instinct and emotions of great commanders. They knew how defeat could be wrung from victory, and how success could be made more overwhelming. At Perdue's Corner Washington City was taken not less than a dozen times a week, and occasionally both New York and Boston were captured and sacked.

MAJOR JIMMY BASS "SURROUNDING" THE ENEMY.

Of all the generals who fought their battles at the Corner, Major Jimmy Bass was the most energetic, the most daring, and the most skillful. As a strategist he had no superior. He had a way of illustrating the feasibility of his plans by drawing them in the sand with his cane. Fat as he was, the major had a way of "surrounding" the enemy so that no avenue was left for his escape. At Perdue's Corner he captured Scott, and McClellan, and Joe Hooker, and John Pope, and held their entire forces as prisoners of war.

In spite of all this, however, the war went on. Sometimes word would come that one of the Hillsborough boys had been shot to death. Now and then one would come home with an arm or a leg missing, so that, before many months had passed, even the generals conducting their campaigns at Perdue's Corner managed to discover that war was a very serious business.

It happened that one day in July Captain Jack Walthall and his men, together with quite an imposing array of comrades, were called upon to breast the sultry thunder of Gettysburg. They bore themselves like men. They went forward with a shout and a rush, facing the deadly slaughter of the guns. They ran up the hill and to the rock wall. With others, Captain Walthall leaped over the wall. They were met by a murderous fire that mowed down the men like grass. The line in the rear wavered, fell back, and went forward again. Captain Walthall heard his name called in his front, and then some one cried, "Don't shoot!" and Little Compton, his face blackened with powder, and his eyes glistening with excitement, rushed into Walthall's arms. The order not to shoot — if it was an order — came too late. There was another volley. As the Confederates rushed forward, the Federal line retreated a little way; and Walthall found himself surrounded by the small remnant of his men. The Confederates made one more effort to advance, but it was useless. The line was borne back, and finally retreated; but when it went down the slope, Walthall and Lieutenant Ransome had Little Compton between them. He was a prisoner. Just how it all happened, no one of the three could describe, but Little Compton was carried into the Confederate lines. He was wounded in the shoulder and in the arm, and the ball that shattered his arm shattered Walthall's arm.

They were carried to the field hospital, where Walthall insisted that Little Compton's wounds should be looked after first. The result was that Walthall lost his left arm and Compton his right, and then, when by some special interposition of Providence they escaped gangrene and other results of imperfect

surgery and bad nursing, they went to Richmond, where Walthall's money and influence secured them comfortable quarters.

Hillsborough had heard of all this in a vague way,— indeed, a rumor of it had been printed in the Rockville *Vade Mecum*,— but the generals and commanders in consultation at Perdue's Corner were astonished one day when the stage-coach set down at the door of the tavern a tall, one-armed gentleman in gray, and a short, one-armed gentleman in blue.

"By the livin' Lord!" exclaimed Major Jimmy Bass, "if that ain't Jack Walthall! And you may put out my two eyes if that ain't Little Compton! Why, shucks, boys!" he exclaimed, as he waddled across the street, "I'd 'a' know'd you anywheres. I'm a little short-sighted, and I'm mighty nigh took off wi' the dropsy, but I'd 'a' know'd you anywheres."

There were handshakings and congratulations from everybody in the town. The clerks and merchants deserted their stores to greet the new-comers, and there seemed to be a general jubilee. For weeks Captain Jack Walthall was compelled to tell his Gettysburg story over and over again, frequently to the same hearers, and, curiously enough, there was never a murmur of dissent when he told how Little Compton had insisted on wearing his Federal uniform.

"Great Jiminy Craminy!" Major Jimmy Bass would exclaim; "don't we all know Little Compton like a book? And ain't he got a right to wear his own duds?"

Rockville, like every other railroad town in the South at that period, had become the site of a Confederate hospital, and sometimes the hangers-on and convalescents paid brief visits of inspection to the neighboring villages. On one occasion a little squad of them made their appearance on the streets of Hillsborough, and made a good-natured attempt to fraternize with the honest citizens who gathered daily at Perdue's Corner. While they were thus engaged, Little Compton, arrayed in his blue uniform, passed down the street. The visitors made some inquiries, and Major Bass gave them a very sympathetic history of Little Compton. Evidently they failed to appreciate the situation, for one of them, a tall Mississippian, stretched himself and remarked to his companions:

"Boys, when we go, we'll just about lift that feller and take him along. He belongs in Andersonville—that's where he belongs."

Major Bass looked at the tall Mississippian and smiled.

"I reckon you must 'a' been mighty sick over yander," said the major, indicating Rockville.

"Well, yes," said the Mississippian; "I've had a pretty tough time."

"And you ain't strong yet," the Major went on.

"Well, I'm able to get about right lively," said the other.

"Strong enough to go to war?"

"Oh, well, not — not just yet."

"Well, then," said the major, in his bluntest tone, "you better be mighty keeful of yourself in this town. If you ain't strong enough to go to war, you better let Little Compton alone."

The tall Mississippian and his friends took the hint, and Little Compton continued to wear his blue uniform unmolested. About this time Atlanta fell, and there were vague rumors in the air, chiefly among the negroes, that Sherman's army would march down and capture Hillsborough, which, by the assembly of generals at Perdue's Corner, was regarded as a strategic point. These vague rumors proved to be correct; and by the time the first frosts fell, Perdue's Corner had reason to believe that General Sherman was marching down on Hillsborough. Dire rumors of fire, rapine, and pillage preceded the approach of the Federal army, and it may well be supposed that these rumors spread consternation in the air. Major Bass professed to believe that General Sherman would be "surrounded" and captured before his troops reached middle Georgia, but the three columns, miles apart, continued their march unopposed.

It was observed that during this period of doubt, anxiety, and terror Little Compton was on the alert. He appeared to be nervous and restless. His conduct was so peculiar that some of the more suspicious citizens of the region predicted that he had been playing the part of a spy, and that he was merely waiting for the advent of Sherman's army in order to point out where his acquaintances had concealed their treasures.

One fine morning a company of Federal troopers rode into Hillsborough. They were met by Little Compton, who had borrowed one of Jack Walthall's horses for just such an occasion. The cavalcade paused in the public square, and, after a somewhat prolonged consultation with Little Compton, rode on in the direction of Rockville. During the day small parties of foragers made their appearance. Little Compton had some trouble with these, but, by hurrying hither and thither, he managed to prevent any depredations. He even succeeded in convincing the majority of them that they owed some sort of respect to that small town. There was one obstinate fellow, however, who seemed determined to prosecute his search for valuables. He was a German who evidently did not understand English.

In the confusion Little Compton lost sight

of the German, though he had determined to keep an eye on him. It was not long before he heard of him again, for one of the Walthall negroes came running across the public square, showing by voice and gesture that he was very much alarmed.

"Marse Compton! Marse Compton!" he cried, "you better run up ter Marse Jack's, kaze one er dem mens is gwine in dar whar ole Miss is, en ef he do dat, he gwine ter git hurted!"

Little Compton hurried to the Walthall place, and he was just in time to see Jack rushing the German down the wide flight of steps that led to the veranda. What might have happened no one can say; what did happen may be briefly told. The German, his face inflamed with passion, had seized his gun, which had been left outside, and was aiming at Jack Walthall, who stood on the steps, cool and erect. An exclamation of mingled horror and indignation from Little Compton attracted the German's attention and caused him to turn his head. This delay probably saved Jack Walthall's life, for the German, thinking that a comrade was coming to his aid, leveled his gun again and fired. But Little Compton had seized the weapon near the muzzle and wrested it around. The bullet, instead of reaching its target, tore its way through Compton's empty sleeve. In another instant the German was covered by Compton's revolver. The hand that held it was steady, and the eyes that glanced along its shining barrel fairly blazed. The German dropped his gun. All trace of passion disappeared from his face; and presently, seeing that the crisis had passed, so far as he was concerned, he wheeled in his tracks, gravely saluted Little Compton, and made off at a double-quick.

"You mustn't think hard of the boys, Jack, on account of that chap. They understand the whole business, and they are going to take care of this town."

And they did. The army came marching along presently, and the stragglers found Hillsborough patrolled by a detachment of cavalry. Walthall and Little Compton stood on the wide steps and reviewed this imposing array as it passed before them. The tall Confederate, in his uniform of gray, rested his one hand affectionately on the shoulder of the stout little man in blue, and on the bosom of each was pinned an empty sleeve. Unconsciously, they made an impressive picture. The Commander, grim, gray, and resolute, observed it with sparkling eyes. The spectacle was so unusual — so utterly opposed to the logic of events — that he stopped with his staff long enough to hear Little Compton tell his story. He was a grizzled, aggressive

man, this Commander, but his face lighted up wonderfully at the recital.

"Well, you know this sort of thing doesn't end the war, boys," he said, as he shook hands with Walthall and Little Compton; "but I shall sleep better to-night."

Perhaps he did. Perhaps he dreamed that what he had seen and heard was prophetic of the days to come, when peace and fraternity should seize upon the land, and bring unity, happiness, and prosperity to the people.

Joel Chandler Harris.

"FOR I KNOW THAT MY REDEEMER LIVETH."

SHALL the mole, from his night underground, call the beasts from the day-glare to flee;
Shall the owl charge the birds: "I am wise. Go to! Seek the shadows with me!"
Shall a man bind his eyes and exclaim: "It is vain that men weary to see"?

Let him walk in the gloom, whoso will. Peace be with him! But whence is his right
To assert that the world is in darkness, because he has turned from the light?
Or to seek to o'ershadow my day with the pall of his self-chosen night?

I have listened, like David's great son, to the voice of the beast and the bird;
To the voice of the trees and the grass,— yea, a voice from the stones I have heard;
And the sun and the moon, and the stars in their courses, reëcho the word!

And one word speak the bird and the beast, and the hyssop that springs in the wall,
And the cedar that lifts its proud head upon Lebanon, stately and tall,
And the rocks, and the sea, and the stars:—and "Know!" is the message of all.

For the answer has ever been nigh unto him who would question and learn;—
How to bring the stars near to his gaze;—in what orbits the planets must turn:—
Why the apple must fall from the bough;—what the fuel that sun-fires burn.

Whence came life? In the rocks is it writ, and no Finger hath graven it there?
Whence came light? Did its motions arise without bidding? Will science declare
That the law ruling all hath upsprung from Nomind, that abideth Nowhere?

"Yea, I know!" cried the true man of old. And whosoe'er wills it may know.
"My Redeemer existeth!" I seek for a sign of his presence, and lo,
As he spoke to the light, and it was,—so he speaks to my soul, and I know!

ABRAHAM LINCOLN : A HISTORY.*

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

THE TERRITORIAL EXPERIMENT.

N. B. JUDD.
FROM A PHOTOGRAPH BY H. ROCHER.

LINCOLN AND TRUMBULL.

THE repeal of the Missouri Compromise at Douglas's instigation, and the consequent loss of the Democratic majority in Congress, have been described. To follow closely the chain of events, we must now examine its effect upon the political fortunes of that powerful leader in his own State of Illinois. In this the reader will be materially aided by a preliminary glance at some of the characteristics and sentiments of the people of that State.

The extreme length of Illinois from north to south is three hundred and eighty-five miles; in geographical situation it extends from the latitude of Massachusetts and New York to that of Kentucky and Virginia. The great westward stream of emigration in the United States has generally followed the parallels of latitude. The pioneers planted their new homes as nearly as might be in a climate like the one they had left. In process of time, therefore, northern Illinois became peopled with settlers from northern or free States, bringing their antislavery traditions and feelings; southern Illinois, with those from southern or slave States, who were as naturally pro-slavery. The Virginians and Kentuckians

readily became converts to the thrift and order of free society; but as a class they never gave up or conquered their intense hatred of antislavery convictions based on merely moral grounds, and which they comprehensively and somewhat indiscriminately stigmatized as "abolitionism." Impelled by this hatred the lawless elements of the community were often guilty of persecution and violence in minor forms, and in 1837, as already related, it prompted the murder of Lovejoy in the city of Alton by a mob, for persisting in his right to publish his antislavery convictions. This is its gravest crime. But a narrow spirit of intolerance extending even down to the Rebellion kept on the statute books a series of acts prohibiting the settlement of free blacks in the State.

It was upon this field of radically diverse sentiment that in the year 1854 Douglas's sudden project of repeal fell like a thunderbolt out of a clear sky. A Democratic governor had been chosen two years before; a Democratic Legislature, called together to consider merely local and economic questions, was sitting in extra session at Springfield. There was doubt and consternation over the new issue. The governor and other prudent partisans avoided a public committal. But the silence could not be long maintained. Douglas was a despotic party leader, and President Pierce had made the Nebraska bill an administration question. Above all, in Illinois, as elsewhere, the people at once took up the discussion, and reluctant politicians were compelled to avow themselves. The Nebraska bill with its repealing clause had been before the country some three weeks and was yet pending in Congress when a member of the Illinois Legislature introduced resolutions indorsing it. Three Democratic State senators, two from northern and one from central Illinois, had the courage to rise and oppose the resolutions in vigorous and startling speeches. They were N. B. Judd of Chicago, B. C. Cook of La Salle, and John M. Palmer of Macoupin. This was an unusual party phenomenon and had its share in hastening the general agitation throughout the State. Only two or three other members took

part in the discussion; the Democrats avoided the issue; the Whigs hoped to profit by the dissension. There was the usual rush of amendments and of parliamentary strategy, and the indorsing resolutions which finally passed in both Houses in ambiguous language and by diminished vote were therefore shorn of much of their political significance.

Party organization was strong in Illinois, and for the greater part, as the popular discussion proceeded, the Democrats sustained and the Whigs opposed the new measure. In the northern counties, where the antislavery sentiment was general, there were a few successful efforts to disband the old parties and create a combined opposition under the new name of Republicans. This, it was soon apparent, would make serious inroads on the existing Democratic majority. But an alarming counter-movement in the central counties, which formed the Whig stronghold, soon began to show itself. Douglas's violent denunciation of "abolitionists" and "abolitionism" appealed with singular power to Whigs from slave States. The party was without a national leader; Clay had died two years before, and Douglas made skillful quotations from the great statesman's speeches to bolster up his new propagandism. In Congress only a little handful of Southern Whigs opposed the repeal, and even these did not dare place their opposition on antislavery grounds. And especially the familiar voice and example of the neighboring Missouri Whigs were given unhesitatingly to the support of the Douglas scheme. Under these combined influences one or two erratic but rather prominent Whigs in central Illinois declared their adherence to Nebraskaism, and raised the hope

that the Democrats would regain in the center and south all they might lose in the northern half of the State.

One additional circumstance had its effect on public opinion. As has been stated, in the opposition to Douglas's repeal the few avowed abolitionists and the many pronounced Free-soilers, displaying unwonted activity, came suddenly into the foreground to rouse and organize public opinion, making it seem for the moment that they had really assumed leadership and control in politics. This class of men had long been held up to public odium. Some of them had, indeed, on previous occasions used intemperate and offensive language; but more generally they were denounced upon a gross misrepresentation of their utterance and purpose. It so happened that they were mostly of Democratic antecedents, which gave them great influence among antislavery Democrats, but made their advice and argument exceedingly distasteful in strong Whig counties and communities. The fact that they now became more prudent, conciliatory, and practical in their speeches and platforms did not immediately remove existing prejudice against them. A few of these appeared in Illinois. Cassius M. Clay published a letter in which he advocated the fusion of anti-Nebraska voters upon "Benton, Seward, Hale, or any other good citizen," and afterwards made a series of speeches in Illinois. When he came to Springfield, the Democratic officers in charge refused him the

use of the rotunda of the State House, a circumstance, however, which only served to draw him a larger audience in a neighboring grove. Later in the summer Giddings and Chase of Ohio made a political tour through the State, and at Springfield the future Secretary and Chief-Justice addressed an unsympathetic audience of a few hundreds in the dingy little courthouse, almost unheralded, save by the epithets of the Democratic newspapers. A few local speakers of this class, of superior address and force, now also began to signalize themselves by a new-born zeal and an attractive eloquence. Conspicuous among these was Owen Lovejoy of northern Illinois, brother of the man who for opinion's sake had been so shamefully murdered at Alton.

While thus in the northern half of Illinois the public condemnation of Douglas's repeal was immediate and sweeping, the formation of opposition to it was tentative and slow in the central and southern counties, where among Whigs of southern birth it proceeded rather upon party feeling than upon moral conviction. The new question struck through party lines in such a manner as to confuse and perplex the masses. But the issue would not be postponed. This was the year for electing Congressmen, and the succession of events rather than the leadership of politicians gradually shaped the campaign.

After a most exciting parliamentary struggle the repeal was carried through Congress in May. Encouraged by this successful domination over Representatives and Senators, Douglas prepared to force its unquestioned acceptance by the people. "I hear men now say," said he, "that they are willing to acquiesce in it. . . . It is not sufficient that they shall not seek to disturb Nebraska and Kansas; but they must acquiesce also in the principle."* In the slave States this was an easy task. The most prominent Democrat who had voted against the Nebraska bill was Thomas H. Benton. The election in Missouri was held in August, and Benton was easily beaten by a Whig who was as fierce for repeal as Douglas himself. In the free States the case was altogether different. In Illinois the Democrats gradually, but at last with a degree of boldness, shouldered the dangerous dogma. The main body of the party rallied under Douglas, excepting a serious defection in the north; on the other hand, the Whigs in a body declared against him, but were weakened by a scattering desertion in the center and south. Meanwhile both retained their distinctive party names and organizations.

Congress adjourned early in August, but

* Douglas's speech before the Union Democratic Club of New York, June 3d, 1854. New York "Herald," June 5th, 1854.

Douglas delayed his return to Illinois. The first of September had come, when it was announced he would return to his home in Chicago. This was an antislavery city, and the

THOMAS H. BENTON.

current of popular condemnation and exasperation was running strongly against him. Public meetings of his own former party friends had denounced him. Street rowdies had burned him in effigy. The opposition papers charged him with skulking and being afraid to meet his constituents. On the afternoon of his coming many flags in the city and on the shipping in the river and harbor were hung at half-mast. At sunset sundry city bells were tolled for an hour to signify the public mourning at his downfall. When he mounted the platform at night to address a crowd of some five thousand listeners he was surrounded by a little knot of personal friends, but the audience before him was evidently cold if not actively hostile.

He began his speech, defending his course as well as he could. He claimed that the slavery question was forever settled by his great principle of popular sovereignty, which took it out of Congress and gave it to the people of the territories to decide as they pleased. The crowd heard him in sullen silence for three-quarters of an hour, when their patience gave out, and they began to ply him with questions. He endured their fire of interrogatory for a little while till he lost his own temper. Excited outcry followed angry repartee. Thrust and rejoinder were mingled

with cheers and hisses. The mayor, who presided, tried to calm the assemblage, but the passions of the crowd would brook no control. Douglas, of short, sturdy build and imperious and controversial nature, stood his ground courageously, with flushed and lowering countenance hurling defiance at his interrupters, calling them a mob, and shaking his fist in their faces; in reply the crowd groaned, hooted, yelled, and made the din of Pandemonium. The tumultuous proceeding continued until half-past ten o'clock at night, when the baffled orator was finally but very reluctantly persuaded by his friends to give up the contest and leave the stand. It was trumpeted abroad by the Democratic newspapers that "in the order-loving, law-abiding abolition-ridden city of Chicago, Illinois's great statesman and representative in the United States Senate was cried down and refused the privilege of speaking";* and as usual the indecent intolerance produced its natural reaction.

But now a new actor came forward on the political stage in central Illinois; or rather, an old favorite reappeared. This was Abraham Lincoln. Since his return to Springfield from his single term of service in Congress, 1847 to 1849, though by no means entirely withdrawn from politics, his active work had been greatly diminished. His congressional life had largely increased the horizon of his observation. Perhaps it had also extended the bounds of his ambition. He had doubtless discovered many of his own defects, and not unlikely had diligently sought to remedy them. The period following had for him been years of work, study, and reflection. His profession of law had become a deeper science

OWEN LOVEJOY.
FROM A PHOTOGRAPH IN POSSESSION OF HIS WIFE.

and a higher responsibility. His practice, receiving his undivided attention, brought him more important and more remunerative cases. Losing nothing of his genial humor, his character took on the dignity of a graver manhood. He was still the center and the idol of every social group he encountered, whether on the street or in the parlor. Serene and buoyant of temper, cordial and winning of language, charitable and tolerant of opinion, his very presence diffused a glow of confidence and kindness. Wherever he went he left an ever-widening ripple of smiles, jests, and laughter. His radiant good fellowship was beloved and sought alike by political opponents and partisan friends. His sturdy and delicate integrity, recognized far and wide, had long since won him the blunt but hearty sobriquet of "Honest Old Abe." But it became noticeable that of late years he was less among the crowd and more in the solitude of his office or his study, and that he seemed ever in haste to leave the eager circle he was entertaining.

It was in the midsummer of 1854 that we find him reappearing upon the stump in central Illinois. The rural population always welcomed his oratory, made up of ready wit, apt illustration, simple statement, forcible logic. His diction was familiar to the ear, his stories were racy of the soil. He never lacked for invitations to address the public. His first speeches on the new and all-absorbing topic were made in the neighboring towns, and in the counties adjoining his own. Towards the end of August the candidates for Congress in that district were, in Western phrase, "on the track." Yates, afterwards one of the famous "war governors," sought a reelection as a

Whig. Harris as a Douglas-Democrat strove to supplant him. Local politics became active, and Lincoln was sent for in all directions to address the people. When he went, however, he distinctly announced that he did not purpose to take up his time with this personal and congressional controversy. His intention was to discuss the principles of the Nebraska bill.

Once launched upon this theme, men were surprised to find him imbued with a new and unwonted seriousness. They heard from his lips fewer anecdotes and more history. Careless listeners who came to laugh at his jokes sat spell-bound by the strong current of his reasoning and the flashes of his earnest eloquence, and were lifted up by the range and tenor of his argument into a fresher and purer political atmosphere. The new discussion was fraught with deeper questions than the improvement of the Sangamon, protective tariffs, or the origin of the Mexican war. Down through incidents of legislation, through history of government, even underlying cardinal maxims of political philosophy, it touched the very bed-rock of primary human rights. Such a subject furnished material for the inborn gifts of the speaker, his intuitive logic, his impulsive patriotism, his pure and poetical conception of legal and moral justice.

Douglas, since his popular rebuff at Chicago on September 1st, had begun, after a few days of delay and rest, a tour of speech-making southward through the State. At these meetings he had at least a respectful hearing, and as he neared central Illinois the reception accorded him became more enthusiastic. The chief interest of the campaign finally centered in a sort of political tournament which took place at the capital, Springfield, during the first week of October; the State Agricultural Fair having called together great crowds, and among them the principal politicians of Illinois. This was Lincoln's home, in a strong Whig county, and in a part of the State where that party had hitherto found its most compact and trustworthy forces. As yet Lincoln had made but a single speech here on the Nebraska question. Of the Federal appointments under the Nebraska bill, Douglas secured two for Illinois, one of which, the office of surveyor-general, he had caused to be given to John Calhoun, the same man who, in the pioneer days twenty years before, was county surveyor in Sangamon and had employed Abraham Lincoln as his deputy. He was also the same who three years later received the sobriquet of "John Candlebox Calhoun," having acquired unenviable notoriety from his reputed connection with the "Cincinnati Directory" and "Can-

dlebox" election frauds in Kansas, and with the famous Lecompton Constitution. Calhoun was still in Illinois doing campaign work in propagating the Nebraska faith. He was recognized as a man of considerable professional and political talent, and had made a speech in Springfield to which Lincoln had replied. It was, however, merely a casual and local affair and was not described or reported by the newspapers.

The meetings at the State Fair were of a different character. The audiences were composed of leading active men from nearly all the counties of the State. Though the discussion of party questions had been going on all the summer with more or less briskness, yet such was the general confusion in politics that many honest and intelligent voters and even leaders were still undecided in their opinions. The fair continued nearly a whole week. Douglas made a speech on the first day, Tuesday, October 3d. Lincoln replied to him on the following day, October 4th. Douglas made a rejoinder, and on that night and the succeeding day and night a running fire of debate ensued, in which John Calhoun, Judge Trumbull, Judge Sidney Breese, Colonel E. D. Taylor, and perhaps others took part.

Douglas's speech was doubtless intended by him and expected by his friends to be the principal and the conclusive argument of the occasion. But by this time the Whig party of the central counties, though shaken by the disturbing features of the Nebraska question, had nevertheless re-formed its lines, and assumed the offensive to which its preponderant numbers entitled it, and resolved not to surrender either its name or organization. In Sangamon county, its strongest men, Abraham Lincoln and Stephen T. Logan, were made candidates for the Legislature. The term of Douglas's colleague in the United States Senate, General James Shields, was about to expire, and the new Legislature would choose his successor. To the war of party principles was therefore added the incentive of a brilliant official prize. The Whigs were keenly alive to this chance and its influence upon their possible ascendancy in the State.

Lincoln's Whig friends had therefore seen his reappearance in active discussion with unfeigned pleasure. Of old they knew his peculiar hold and influence upon the people and his party. His few speeches in the adjoining counties had once more shown them his maturing intellect, his expanding power in debate. Acting upon himself, this renewed practice on the stump crystallized his thoughts and brought method to his argument. The opposition newspapers had accused him of

"mousing about the libraries in the State House." The charge was true. Where others were content to take statements at second hand, he preferred to verify citations as well as to find new ones. His treatment of his theme was therefore not only bold but original.

By a sort of common consent he was looked to, to answer Douglas's speech. This was no light task, and no one knew it better than Lincoln. Douglas's real ability was, and remains, unquestioned. In many qualities of intellect he was truly the "Little Giant" which popular fancy nicknamed him. It was no mere chance that raised the Vermont cabinet-maker's apprentice from a penniless stranger in Illinois in 1833 to a formidable competitor for supreme leadership in the great Democratic party of the nation in 1852. When after the lapse of a quarter of a century we measure him with the veteran chiefs whom he aspired to supplant, we see the substantial basis of his confidence and ambition. His great error of statesmanship aside, he stands forth more than the peer of associates who underrated his power and looked askance at his pretensions. In the six years of perilous party conflict which followed, every conspicuous party rival disappeared in obscurity, disgrace, or rebellion. Battling while others feasted, sowing where others reaped, abandoned by his allies and persecuted by his friends, Douglas alone emerged from the fight with loyal faith and unshaken courage, bringing with him through treachery, defeat, and disaster the unflinching allegiance and enthusiastic admiration of nearly three-fifths of the rank and file of the once victorious army of Democratic voters. He had not only proved himself its most trustworthy guide and most gallant chief, but as a final crown of merit he led his still powerful contingent of followers to a patriotic defense of the Constitution and government which some of his unworthy compeers put into such mortal jeopardy.

We find him here at the beginning of this severe conflict in the full flush of hope and ambition. He was winning in personal manner, brilliant in debate, aggressive in party strategy. To this he added an adroitness in evasion and false logic perhaps never equaled, and in his defense of the Nebraska measure this questionable but convenient gift was ever his main reliance. Besides, his long official career gave to his utterances the stamp and glitter of oracular statesmanship. But while Lincoln knew all Douglas's strong points he was no less familiar with his weak ones. They had come to central Illinois about the same time, and had in a measure grown up together. Socially they were on friendly terms;

politically they had been opponents for twenty years. At the bar, in the Legislature, and on the stump they had often met and measured strength. Each therefore knew the temper of the other's steel no less than every joint in his armor.

It was a peculiarity of the early West — perhaps it pertains to all primitive communities — that the people retained a certain fragment of the chivalric sentiment, a remnant of the instinct of hero-worship. As the ruder athletic sports faded out, as shooting-matches, wrestling-matches, horse-races, and kindred games fell into disuse, political debate became, in a certain degree, their substitute. But the principle of championship, while it yielded high honor and consideration to the victor, imposed upon him the corresponding obligation to recognize every opponent and accept every challenge. To refuse any contest, to plead any privilege, would be instant loss of prestige. This supreme moment in Lincoln's career, this fateful turning of the political tide, found him fully prepared for the new battle, equipped by reflection and research to permit himself to be pitted against the champion of Democracy — against the very author of the raging storm of parties; and it displays his rare self-confidence and consciousness of high ability to venture to attack such an antagonist at such a time.

Douglas made his speech, according to notice, on the first day of the fair, Tuesday October 3d. "I will mention," said he in his opening remarks, "that it is understood by some gentlemen that Mr. Lincoln, of this city, is expected to answer me. If this is the understanding, I wish that Mr. Lincoln would step forward and let us arrange some plan upon which to carry out this discussion." Mr. Lincoln was not there at the moment, and the arrangement could not then be made. Unpropitious weather had brought the meeting to the Representative's Hall in the State House, which was densely packed. The next day found the same hall filled as before to hear Mr. Lincoln. Douglas occupied a seat just in front of him and in his rejoinder he explained that "my friend Mr. Lincoln expressly invited me to stay and hear him speak to-day, as he heard me yesterday, and to answer and defend myself as best I could. I here thank him for his courteous offer." The occasion greatly equalized the relative standing of the champions. The familiar surroundings, the presence and hearty encouragement of his friends, put Lincoln in his best vein. His bubbling humor, his perfect temper, and above all the overwhelming current of his historical arraignment extorted the admiration of even his political enemies. "His speech was four hours

in length," wrote one of these,* "and was conceived and expressed in a most happy and pleasant style, and was received with abundant applause. At times he made statements which brought Senator Douglas to his feet, and then good-humored passages of wit created much interest and enthusiasm." All reports plainly indicate that Douglas was astonished and disconcerted at this unexpected display of oratorical power, and that he struggled vainly through a two hours' rejoinder to break the force of Lincoln's victory in the debate. Lincoln had hitherto been the foremost man in his district. That single effort made him the leader in his State.

The fame of this success brought Lincoln urgent calls from all the places where Douglas was advertised or expected to make a speech. Accordingly, twelve days afterwards, October 16th, they once more met in debate, at Peoria. Lincoln, as before, gave Douglas the opening and closing speech, explaining that he was willing to yield this advantage in order to secure a hearing from the Democratic portion of his listeners. The audience was a large one, but not so representative in its character as that at Springfield. The occasion is made memorable, however, by the fact that when Lincoln returned home he wrote out and published his speech. We have therefore the exact and revised text of his argument, and are able to estimate its character and value. Marking as it does with unmistakable precision a step in the second period of his intellectual development, it deserves the careful attention of the student of his life.

After the lapse of a quarter of a century the critical reader still finds it a model of brevity, directness, terse diction, exact and lucid historical statement, and full of logical propositions so short and so strong as to resemble mathematical axioms. Above all it is pervaded by an elevation of thought and aim that lifts it out of the commonplace of mere party controversy. Comparing it with his later speeches, we find it to contain not only the argument of the hour, but the premonition of the broader issues into which the new struggle was destined soon to expand.

The main, broad current of his reasoning was to vindicate and restore the policy of the fathers of the country in the restriction of slavery; but running through this like a thread of gold was the demonstration of the essential injustice and immorality of the system.

"This declared indifference," said he, "but, as I must think, covert zeal for the spread of slavery, I cannot but hate. I hate it because of the monstrous injustice of slavery itself. I hate it because it deprives

our republican example of its just influence in the world; enables the enemies of free institutions with plausibility to taunt us as hypocrites; causes the real friends of freedom to doubt our sincerity; and especially because it forces so many really good men among ourselves into an open war with the very fundamental principles of civil liberty, criticising the Declaration of Independence and insisting that there is no right principle of action but self-interest.

"The doctrine of self-government is right,—absolutely and eternally right,—but it has no just application as here attempted. Or perhaps I should rather say that whether it has such just application, depends upon whether a negro is not, or is, a man. If he is not a man, in that case he who is a man may as a matter of self-government do just what he pleases with him. But if the negro is a man, is it not to that extent a total destruction of self-government to say that he too shall not govern himself? When the white man governs himself, that is self-government; but when he governs himself and also governs another man, that is more than self-government—that is despotism.

"What I do say is, that no man is good enough to govern another man without that other's consent.

"The master not only governs the slave without his consent, but he governs him by a set of rules altogether different from those which he prescribes for himself. Allow all the governed an equal voice in the government; that, and that only, is self-government.

"Slavery is founded in the selfishness of man's nature—opposition to it in his love of justice. These principles are an eternal antagonism; and when brought into collision so fiercely as slavery extension brings them, shocks and throes and convulsions must ceaselessly follow. Repeal the Missouri Compromise—repeal all compromise—repeal the Declaration of Independence—repeal all past history—still you cannot repeal human nature.

"I particularly object to the new position which the avowed principle of this Nebraska law gives to slavery in the body politic. I object to it because it assumes that there can be moral right in the enslaving of one man by another. I object to it as a dangerous dalliance for a free people,—a sad evidence that feeling prosperity, we forget right,—that liberty as a principle we have ceased to revere.

"Little by little, but steadily as man's march to the grave, we have been giving up the old for the new faith. Near eighty years ago we began by declaring that all men are created equal; but now from that beginning we have run down to the other declaration that for some men to enslave others is a 'sacred right of self-government.' These principles cannot stand together. They are as opposite as God and mammon.

"Our Republican robe is soiled and trailed in the dust. Let us repurify it. Let us turn and wash it white, in the spirit if not the blood of the Revolution. Let us turn slavery from its claims of 'moral right' back upon its existing legal rights, and its arguments of 'necessity.' Let us return it to the position our fathers gave it, and there let it rest in peace. Let us readopt the Declaration of Independence, and the practices and policy which harmonize with it. Let North and South—let all Americans—let all lovers of liberty everywhere—join in the great and good work. If we do this, we shall not only have saved the Union, but we shall have so saved it, so as to make and to keep it forever worthy of the saving. We shall have so saved it that the succeeding millions of free, happy people, the world over, shall rise up and call us blessed to the latest generations."

* Correspondence "Missouri Republican," October 6th, 1854.

The election which occurred November 7th resulted disastrously for Douglas. It was soon found that the Legislature on joint ballot would probably give a majority for Senator against Shields, the incumbent, or any other Democrat who had supported the Nebraska bill. Who might become his successor was more problematical. The opposition majority was made up of anti-Nebraska Democrats, of what were then called "abolitionists" (Lovejoy had been elected among these), and finally of Whigs, who numbered by far the largest portion. But these elements, except on one single issue, were somewhat irreconcilable. In this condition of uncertainty a host of candidates sprang up. There was scarcely a member of Congress from Illinois—indeed, scarcely a prominent man in the State of any party—who did not conceive the flattering dream that he himself might become the lucky medium of compromise and harmony.

Among the Whigs, though there were other aspirants, Lincoln, whose speeches had contributed so much to win the election, was the natural and most prominent candidate. According to Western custom, he addressed a short note to most of the Whig members elect and to other influential members of the party asking their support. Generally the replies were not only affirmative but cordial and even enthusiastic. But a dilemma now arose. Lincoln had been chosen one of the members from Sangamon county by some six hundred and fifty majority. The Constitution of Illinois contained a clause disqualifying members of the Legislature and certain other designated officials from being elected to the Senate. Good lawyers generally believed this provision repugnant to the Constitution of the United States, and that the qualifications of Senators and Representatives therein prescribed could be neither increased nor diminished by a State. But the opposition had only a majority of one or two. If Lincoln resigned his membership in the Legislature this might destroy the majority. If he refused to resign, such refusal might carry some member to the Democrats.

At last, upon full deliberation, Lincoln resigned his seat, relying upon the six or seven hundred majority in Sangamon county to elect another Whig. It was a delusive trust. A reaction in the Whig ranks against "abolitionism" suddenly set in. A listless apathy succeeded the intense excitement and strain of

the summer's canvass. Local rivalries forced the selection of an unpopular candidate. Shrewdly noting all these signs the Democrats of Sangamon now organized what is known in Western politics as a "still-hunt." They made a feint of allowing the special election to go by default. They made no nomination. They permitted an independent Democrat, known under the sobriquet of "Steamboat Smith," to parade his own name. Up to the very day of election they gave no public sign, although they had in the utmost secrecy instructed and drilled their precinct squads. On the morning of election the working Democrats appeared at every poll, distributing tickets bearing the name of a single candidate not before mentioned by any one. They were busy all day long spurring up the lagging and indifferent, and bringing the aged, the infirm, and the distant voters in vehicles. Their ruse succeeded. The Whigs were taken completely by surprise, and in a remarkably small total vote, McDaniels, Democrat, was chosen by some sixty majority. The Whigs in other parts of the State were furious at the unlooked-for result, and the incident served greatly to complicate the senatorial canvass.

Nevertheless it turned out that even after this loss the opposition to Douglas would have a majority on joint ballot. But how unite this opposition made up of Whigs, of Democrats, and of so-called abolitionists? It was just at that moment in the impending revolution of parties when everything was doubt, distrust, uncertainty. Only these abolitionists, ever aggressive on all slavery issues, were ready to lead off in new combinations, but nobody was willing to encounter the odium of acting with them. They, too, were present at the State Fair, and heard Lincoln reply to Douglas. At the close of that reply, and just before Douglas's rejoinder, Lovejoy had announced to the audience that a Republican State Convention would be immediately held in the Senate Chamber, extending an invitation to delegates to join in it. But the appeal fell upon unwilling ears. Scarcely a corporal's guard left the discussion. The Senate Chamber presented a discouraging array of empty benches. Only some twenty-six delegates were there to represent the great State of Illinois. Nothing daunted, they made their speeches and read their platform to each other.* Particularly, however, in their addresses they praised Lincoln's great speech

* Their resolutions were radical for that day but not so extreme as was generally feared. On the slavery question they declared their purpose: to restore Kansas and Nebraska to the position of free territories; that as the Constitution of the United States vests in the States and not in Congress the power to legislate for the rendition of fugitives from labor, to repeal and entirely abrogate the fugitive slave law; to restrict

slavery to those States in which it exists; to prohibit the admission of any more slave States; to abolish slavery in the District of Columbia; to exclude slavery from all territories over which the General Government has exclusive jurisdiction, and finally to resist the acquisition of any more territories unless slavery shall have been therein forever prohibited.

which they had just heard, notwithstanding his declarations differed so essentially from their new-made creed. "Ichabod raved," said the Democratic organ in derision, "and Lovejoy swelled, and all indorsed the sentiments of that speech." Not content with this, without consent or consultation, they placed Lincoln's name in the list of their State Central Committee.

Matters remained in this attitude until their chairman called a meeting and notified Lincoln to attend. In reply he sent the following letter of inquiry :

"While I have pen in hand allow me to say that I have been perplexed some to understand why my name was placed on that committee. I was not consulted on the subject, nor was I apprised of the appointment until I discovered it by accident two or three weeks afterwards. I suppose my opposition to the principle of slavery is as strong as that of any member of the Republican party; but I had also supposed that the extent to which I feel authorized to carry that opposition practically was not at all satisfactory to that party. The leading men who organized that party were present on the 4th of October at the discussion between Douglas and myself at Springfield and had full opportunity to not misunderstand my position. Do I misunderstand them?" *

Whether this letter was ever replied to is uncertain, though improbable. No doubt it led to conferences during the meeting of the Legislature, early in the year 1855, when the senatorial question came on for decision. It has been suggested that Lincoln made dishonorable concessions of principle to get the votes of Lovejoy and his friends. The statement is too absurd to merit serious contradiction. The real fact is that Mr. Giddings, then in Congress, wrote to Lovejoy and others to support Lincoln. Various causes delayed the event, but finally, on February 8th, 1855, the Legislature went into joint ballot. A number of candidates were put in nomination, but the contest narrowed itself down to three. Abraham Lincoln was supported by the Whigs and Free-soilers; James Shields by the Douglas-Democrats. As between these two, Lincoln would have easily succeeded, had not five anti-Nebraska Democrats refused under any circumstances to vote for him or any other Whig,†

and steadily voted during six ballots for Lyman Trumbull. The first vote stood: Lincoln, forty-five; Shields, forty-one; Trumbull, five; scattering, eight. Two or three Whigs had thrown away their votes on this first ballot, and though they now returned and adhered to him, the demoralizing example was imitated by various members of the coalition. On the sixth ballot the vote stood: Lincoln, thirty-six; Shields, forty-one; Trumbull, eight; scattering, thirteen.

At this stage of the proceedings the Douglas-Democrats executed a change of front, and, dropping Shields, threw nearly their full strength, forty-four votes, for Governor Joel A. Matteson. The maneuver was not unexpected, for though the governor and the party newspapers had hitherto vehemently asserted he was no candidate, the political signs plainly contradicted such statement. Matteson had assumed a quasi-independent position; kept himself non-committal on Nebraska, and opposed Douglas's scheme of tonnage duties to improve Western rivers and harbors. Like the great majority of Western men he had risen from humble beginnings, and from being a gold-hunter, emigrant, farmer, contractor, and speculator had become governor. In office he had devoted himself specially to the economical and material questions of Illinois, and in this rôle had a certain popularity with all classes and parties.

The substitution of his name proved a shrewd and promising device. The ninth ballot gave him forty-seven votes. The opposition under the excitement of non-partisan appeals began to break up. Of the remaining votes Lincoln received fifteen, Trumbull thirty-five, scattering one. In this critical moment Lincoln exhibited a generosity and a sagacity above the range of the mere politician's vision. He urged upon his Whig friends and supporters to drop his own name and join without hesitation or conditions in the election of Trumbull.‡ This was putting their fidelity to a bitter trial. Upon every issue but the Nebraska bill Trumbull still avowed himself an uncompromising Democrat. The faction

* Lincoln to Coddington, Nov. 27th, 1854. MS.

† "All that remained of the anti-Nebraska force, excepting Judd, Cook, Palmer, Baker, and Allen of Madison, and two or three of the secret Matteson men, would go into caucus, and I could get the nomination of that caucus. But the three Senators and one of the two Representatives above named 'could never vote for a Whig,' and this incensed some twenty Whigs to 'think' they would never vote for the man of the five." — [Lincoln to Hon. E. B. Washburne, February 9th, 1855. MS.]

‡ "In the mean time our friends, with a view of detaining our expected bolters, had been turning from me to Trumbull till he had risen to thirty-five and I had been reduced to fifteen. These would never desert me

except by my direction; but I became satisfied that if we could prevent Matteson's election one or two ballots more, we could not possibly do so a single ballot after my friends should begin to return to me from Trumbull. So I determined to strike at once; and accordingly advised my remaining friends to go for him, which they did, and elected him on that, the tenth ballot. Such is the way the thing was done. I think you would have done the same under the circumstances, though Judge Davis, who came down this morning, declares he never would have consented to the forty-seven [opposition] men being controlled by the five. I regret my defeat moderately, but am not nervous about it." — [Lincoln to Washburne, February 9th, 1855. MS.]

of five had been stubborn to defiance and disaster. They would compel the mountain to go to Mahomet. It seemed an unconditional surrender of the Whig party. But such was Lincoln's influence upon his adherents that at his request they made the sweeping sacrifice, though with the lingering sorrow of men at the burial of a near and dear friend. The proceedings had wasted away a long afternoon of most tedious suspense. Evening had come; the gas was lighted in the hall, the galleries were filled with beautiful and eager women, the lobbies were packed with restless and nervously anxious men. All had forgotten the lapse of hours, their fatigue and their hunger, in the absorption of the fluctuating contest. The roll-call of the tenth ballot still showed fifteen votes for Lincoln, thirty-six for Trumbull, forty-seven for Matteson. Amid an excitement which was becoming painful, and in a silence where spectators scarcely breathed, Judge Stephen T. Logan, Lincoln's nearest and warmest friend, arose and announced the purpose of the remaining Whigs to decide the contest, whereupon the entire fifteen changed their votes to Trumbull. This gave him the necessary number of fifty-one, and elected him a Senator of the United States.

At that early day an election to the United States Senate must have seemed to Lincoln a most brilliant political prize, the highest, perhaps, to which he then had any hopes of ever attaining. To school himself to its loss with becoming resignation, to wait hopefully during four years for another opportunity, to engage in the dangerous and difficult task of persuading his friends to leave their old and join a new political party only yet dimly foreshadowed, to study the chances of maintaining his party leadership, furnished sufficient occupation for the leisure afforded by the necessities of his law practice. It is interesting to know that he did more; that amid the consideration of mere personal interests, he was vigilantly pursuing a study of the higher phases of the great moral and political struggle on which the nation was just entering. A letter of his written to a friend in Kentucky in the following year shows us that he had nearly reached a maturity of conviction on the nature of the slavery conflict — his belief that the nation could not permanently endure half slave and half free — which he did not publicly express until the beginning of his famous senatorial campaign of 1858:

"SPRINGFIELD, ILLS., August 15, 1855.

"HON. GEO. ROBERTSON, Lexington, Ky.

"MY DEAR SIR: The volume you left for me has been received. I am really grateful for the honor of your kind remembrance, as well as for the book. The partial reading I have already given it has afforded

me much of both pleasure and instruction. It was new to me that the exact question which led to the Missouri Compromise had arisen before it arose in regard to Missouri, and that you had taken so prominent a part in it. Your short but able and patriotic speech on that occasion has not been improved upon since by those holding the same views; and, with all the lights you then had, the views you took appear to me as very reasonable.

"You are not a friend of slavery in the abstract. In that speech you spoke of 'the peaceful extinction of slavery' and used other expressions indicating your belief that the thing was, at some time, to have an end. Since then we have had thirty-six years of experience; and this experience has demonstrated, I think, that there is no peaceful extinction of slavery in prospect for us. The signal failure of Henry Clay and other good and great men, in 1849, to effect anything in favor of gradual emancipation in Kentucky, together with a thousand other signs, extinguishes that hope utterly. On the question of liberty, as a principle, we are not what we have been. When we were the political slaves of King George, and wanted to be free, we called the maxim that 'all men are created equal' a self-evident truth; but now when we have grown fat, and have lost all dread of being slaves ourselves, we have become so greedy to be *masters* that we call the same maxim 'a self-evident lie.' The Fourth of July has not quite dwindled away; it is still a great day for burning *fire-crackers*!

"That spirit which desired the peaceful extinction of slavery has itself become extinct with the *occasion* and the *men* of the Revolution. Under the impulse of that occasion, nearly half the States adopted systems of emancipation at once; and it is a significant fact that not a single State has done the like since. So far as peaceful, voluntary emancipation is concerned, the condition of the negro slave in America, scarcely less terrible to the contemplation of a free mind, is now so fixed and hopeless of change for the better as that of the lost souls of the finally impenitent. The Autocrat of all the Russias will resign his crown and proclaim his subjects free republicans, sooner than will our American masters voluntarily give up their slaves.

"Our political problem now is, 'Can we as a nation continue together *permanently* — *forever* — half slaves, and half free?' The problem is too mighty for me. May God in his mercy superintend the solution. Your much obliged friend, and humble servant,

"A. LINCOLN."

The reader has doubtless already noted in his mind the curious historical coincidence which so soon followed the foregoing speculative affirmation. On the day before Lincoln's first inauguration as President of the United States, the "Autocrat of all the Russias," Alexander II., by imperial decree emancipated his serfs; while six weeks after the inauguration, the "American masters," headed by Jefferson Davis, began the greatest war of modern times, to perpetuate and spread the institution of slavery.

THE BORDER RUFFIANS.

THE passage of the Nebraska bill and the hurried extinction of the Indian title opened nearly fifteen million acres of public lands to settlement and purchase. The whole of this vast area was yet practically tenantless. In

all of Kansas there were only three military posts, eight or ten missions or schools attached to Indian reservations, and some scores of roving hunters and traders or squatters in the vicinity of a few well-known camping stations on the two principal emigrant and trading routes, one leading southward to New Mexico, the other northward toward Oregon. But such had been the interest created by the political excitement, and so favorable were the newspaper reports of the location, soil, and climate of the new country, that a few months sufficed to change Kansas from a closed and prohibited Indian reserve to the emigrant's land of promise.

Douglas's oracular "stump speech" in the Nebraska bill transferred the struggle for slavery extension from Congress to the newly organized territories. "Come on, then, gentlemen of the slave States," said Seward in a Senate discussion; "since there is no escaping your challenge, I accept it in behalf of Freedom. We will engage in competition for the virgin soil of Kansas, and God give the victory to the side that is stronger in numbers as it is in right." With fifteen millions in the North against ten millions in the South, the result could not be in doubt.

Feeling secure in the evident advantage, the North, in general, trusted implicitly to the ordinary and natural movement of emigration. To the rule, however, there were a few exceptions. Some members of Congress, incensed at the tactics of the Nebraska leaders, formed a Kansas Aid Society in Washington City and contributed money to assist emigrants.* Beyond this initiatory step they do not seem to have had any personal participation in it, and its office and working operations were soon transferred to New York. Sundry similar organizations were also formed by private individuals. The most notable of these was a Boston company chartered in March, named "The Massachusetts Emigrant Aid Company." The charter was soon abandoned, and the company reorganized June 13th, under private articles of association;† and in this condition it became virtually the working agency of philanthropic citizens of New England, headed by Hon. Eli Thayer. There were several auxiliary societies and a few independent associations.‡ But from what then and afterwards came to light, it appears that Mr. Thayer's society was the only one whose operations reached any degree of success deserving historical notice. This company gave publicity, through newspaper advertisements and pamphlets, of its willingness to organize emigrants into companies, to send them to Kansas in charge

of trustworthy agents, and to obtain transportation for them at reduced rates. It also sent the machinery for a few saw-mills, and the types and presses for two or three newspapers, and erected a hotel or boarding-house to accommodate new-comers. It purchased and held only the land necessary to locate these business enterprises. It engaged in no speculation, paid no fare of any emigrants, and expressly disavowed the requirement of any oath or pledge of political sentiment or conduct. All these transactions were open, honest, and lawful, carefully avoiding even the implication of moral or political wrong.

Under the auspices of this society a pioneer company of about thirty persons arrived in Kansas in July, 1854, and founded the town of Lawrence.§ Other parties followed from time to time, sending out offshoots, but mainly increasing the parent settlement, until next to Fort Leavenworth, the principal military post, Lawrence became the leading town of the territory. The erection of the society hotel, the society saw-mills, and the establishment of a newspaper also gave it leadership in business and politics as well as population. This humane and praiseworthy enterprise has been gravely charged with the origin and responsibility of the political disorders which followed in Kansas. Nothing could be further from the truth. Before it had assisted five hundred persons to their new homes, the territory had by regular and individual immigration, mainly from the Western States, acquired a population of 8501 souls, as disclosed by the official census taken after the first summer's arrivals, and before those of the second had begun. It needs only this mere statement to refute the political slander so industriously repeated in high places against the Lawrence immigrants.

Deeper causes than the philanthropy or zeal of a few Boston enthusiasts were actively at work. The balance of power between the free and the slave States had been destroyed by the admission of California. To restore that balance the South had consummated the repeal of the Missouri Compromise as a first and indispensable step. The second equally indispensable step was to seize the political control of the new territory.

Kansas lay directly west of the State of Missouri. For a frontier State, the pro-slavery sentiment of Missouri was very pronounced and ultra, especially along the Kansas border. The establishment of slavery in this new region had formed the subject of public and local discussion before the Nebraska bill, and Senator Atchison had promised his western Missouri constituents to labor for such a result.

* Testimony of Hon. Daniel Mace.

† Hale's "Kansas and Nebraska," p. 229.

‡ "Tribune" Almanac, 1856, p. 28.

§ Phillips's "Conquest of Kansas," p. 27.

From the time the unlooked-for course of Senator Douglas made it a practical possibility, Atchison was all zeal and devotion to this object, which he declared was almost as dear to him as his hope of heaven. When it finally became a question to be decided perhaps by a single frontier election, his zeal and work in that behalf were many times multiplied.

Current reports and subsequent developments leave no doubt that this Senator, being then acting Vice-President of the United States,* immediately after the August adjournment of Congress hurried away to his home in Platte county, Missouri, and from that favorable situation personally organized a vast conspiracy, running through nearly all the counties of his State adjoining the Kansas border, to decide the slavery question for Kansas by Missouri votes. Secret societies under various names, such as "Blue Lodges," "Friends Society," "Social Band," "Sons of the South," were organized and affiliated, with all the necessary machinery of oaths, grips, signs, passwords, and badges. The plan and object of the movement were in general kept well concealed. Such publicity as could not be avoided served rather to fan the excitement, strengthen the hesitating, and frown down all dissent and opposition. Long before the time for action arrived, the idea that Kansas must be a slave State had grown into a fixed and determined public sentiment.

The fact is not singular if we remember the peculiar situation of that locality. It was before the great expansion of railroads, and western Missouri could only be conveniently approached by the single commercial link of steamboat travel on the turbid and dangerous Missouri River. Covering the rich alluvial lands along that majestic but erratic stream lay the heavy slave counties of the State, wealthy from the valuable slave products of hemp and tobacco. Slave tenure and slavery traditions in Missouri dated back a full century, to the remote days when the American Bottom opposite St. Louis was one of the chief bread and meat producing settlements of New France, sending supplies northward to Mackinaw, southward to New Orleans, and eastward to Fort Duquesne. When in 1763 "the Illinois" country passed by treaty under the British flag, the old French colonists, with their slaves, almost in a body crossed the Mississippi into then Spanish territory, and with fresh additions from New Orleans founded St. Louis and its outlying settlements; and these, growing with a steady thrift, extended themselves up the Missouri River. Slavery was thus iden-

tified with the whole history and also with the apparent prosperity of the State; and it had in recent times made many of these Western counties rich. The free State of Iowa lay a hundred miles to the north, and the free State of Illinois two hundred to the east; a wall of Indian tribes guarded the west. Should all this security be suddenly swept away, and their runaways find a free route to Canada by simply crossing the county line? Should the price of their personal "chattels" suddenly fall one-half for want of a new market? With nearly fifteen million acres of fresh land to choose from for the present outlay of a trifling preëmption fee, should not the poor white compel his single "black boy" to follow him a few miles west, and hoe his tobacco for him on the new fat bottom-lands of the Kaw River? Even such off-hand reasoning was probably confined to the more intelligent. For the greater part these ignorant but stubborn and strong-willed frontiersmen were moved by a bitter hatred of "abolitionism," because the word had now been used for half a century by partisans high and low,—Governors, Senators, Presidents,—as a term of opprobrium and a synonym of crime. With these as fathers of the faith and the Vice-President of the United States as an apostle to preach a new crusade, is it astonishing that there was no lack of listeners, converts, and volunteers? Senator Atchison spoke in no ambiguous words.

"When you reside in one day's journey of the territory," said he, "and when your peace, your quiet, and your property depend upon your action, you can without an exertion send five hundred of your young men who will vote in favor of your institutions. Should each county in the State of Missouri only do its duty, the question will be decided quietly and peaceably at the ballot-box. If we are defeated, then Missouri and the other Southern States will have shown themselves recreant to their interests and will deserve their fate."†

Western water transportation found its natural terminus where the Kaw or Kansas river empties itself into the Missouri. From this circumstance that locality had for years been the starting-point for the overland caravans or wagon-trains. Fort Leavenworth was the point of rendezvous for those going to California and Oregon; Independence the place of outfit for those destined to Santa Fe. Grouped about these two points were half a dozen heavy slaveholding counties of Missouri,—Platte, Clay, Ray, Jackson, Lafayette, Saline, and others. Platte county, the home of Senator Atchison, was their western outpost, and lay like an outspread fan in the great bend

* By virtue of his office as President *pro tempore* of the United States Senate. The Vice-Presidency was vacant; Mr. King, chosen with President Pierce, had died.

† Speech in Platte county. Phillips's "Conquest of Kansas," p. 43.

of the Missouri, commanding from thirty to fifty miles of river front. Nearly all of Kansas attainable by the usual water transportation and travel lay immediately opposite. A glance at the map will show how easily local sentiment could influence or dominate commerce and travel on the Missouri River. In this connection the character of the population must be taken into account.

The spirit of intolerance which once pervaded all slaveholding communities, in whatever State of the Union, was here rampant to an unusual degree. The rural inhabitants were marked by the strong characteristics of the frontier,—fondness of adventure, recklessness of exposure or danger to life, a boastful assertion of personal right, privilege, or prowess, a daily and hourly familiarity with the use of fire-arms. These again were heightened by two special influences,—the presence of Indian tribes whose reservations lay just across the border, and the advent and preparation of each summer's emigration across the great plains. The "Argonauts of '49" were not all gamblers and cut-throats of border song and story. Generally, however, they were men of decision and will, all mere drift-wood in the great current of gold-seekers being soon washed ashore and left behind. Until they finished their last dinner at the Planter's House in St. Louis, the fledgelings of cities, the lawyers, doctors, merchants, and speculators, were in or of civilization. Perhaps they even resisted the contamination of cards and drink, profanity and revolver salutations, while the gilded and tinsel Missouri River steamboat bore them for three days against its muddy current and boiling eddies to meet their company and their outfit. But once landed at Independence or Leavenworth, they were of the frontier, of the wilderness, of the desert. Here they donned their garments of red flannel and coarse cloth or buckskin, thrust the legs of their trousers inside the tops of their heavy boots, and wore their bowie-knife or revolver in their outside belt. From this departure all were subject to the inexorable equality of the camp. Eating, sleeping, standing guard, tugging at the wheel or defending life and property,—there was no rank between captain or cook, employer or employed, savant or ignoramus, but the distribution of duty and the assignment of responsibility. Toil and exposure, hunger and thirst, wind and storm, danger in camp quarrel or Indian ambush, were the familiar and ordinary vicissitudes of a three months' journey in a caravan of the plains. To the common hazards of the frontier was thus added the recklessness of a doubtful, often a desperate, throw in the game of life.

All this movement created business for these

Missouri River towns. Their few inhabitants drove a brisk trade in shirts and blankets, guns and powder, hard-bread and bacon, wagons and live stock. Petty commerce busied itself with the art of gain rather than with the labor of reform. Indian and emigrant traders did not too closely scan their sources of profit. The precepts of the divine and the penalties of the human law sat lightly upon them. As yet many of these frontier towns were small hamlets, without even a pretext of police regulations. Passion, therefore, ran comparatively a free course, and the personal redress of private wrongs was only held in check by the broad and acknowledged right of self-defense. Since 1849 and 1850, when the gold fever was at its height, emigration across the plains had slackened, and the eagerness for a revival of this local traffic undoubtedly exerted its influence in procuring the opening of the territories in 1854. The noise and excitement created by the passage of the Kansas-Nebraska Act awakened the hope of frontier traders and speculators, who now greedily watched all the budding opportunities of gain. Under such circumstances these opportunities to the shrewd, to the bold, and especially to the unscrupulous, are many. Cheap lands, unlimited town lots, eligible trading sites, the multitude of franchises and privileges within the control of a territorial legislature, the offices to be distributed under party favoritism, offer an abundant lure to enterprise and far more to craft. It was to such a population and under such a condition of things that Senator Atchison went to his home in Platte county in the summer of 1854 to preach his pro-slavery crusade against Kansas. His personal convictions, his party faith, his senatorial reelection, and his financial fortunes, were all involved in the scheme. With the help of the Stringfellows and other zealous co-workers, the town of Atchison was founded and named in his honor, and the "Squatter Sovereign" newspaper established, which displayed his name as a candidate for the Presidency. The good-will of the Administration was manifested by making one of the editors postmaster at the new town.

President Pierce appointed as Governor of Kansas territory Andrew H. Reeder, a member of his own party, from the free State of Pennsylvania. He had neither prominent reputation nor conspicuous ability, though under trying circumstances he afterwards showed diligence, judgment, integrity, and more than ordinary firmness and independence. It is to be presumed that his fitness in a partisan light had been thoroughly scrutinized by both President and Senate. Upon the vital point the investigation was deemed conclusive. "He was appointed," the "Washington Union" naïvely

FROM A RECENT PHOTOGRAPH.

stated when the matter was first called in question, "under the strongest assurance that he was strictly and honestly a national man. We are able to state further, on very reliable authority, that whilst Governor Reeder was in Washington, at the time of his appointment, he conversed with Southern gentlemen on the subject of slavery, and assured them that he had no more scruples in buying a slave than a horse, and regretted that he had not money to purchase a number to carry with him to Kansas." With him were appointed three Federal judges, a secretary, a marshal, and an attorney for the territory, all doubtless considered equally trustworthy on the slavery question. The organic act invested

the governor with very comprehensive powers to initiate the organization of the new territory. Until the first legislature should be duly constituted, he had authority to fix election days, define election districts, direct the mode of returns, take a census, locate the temporary seat of government, declare vacancies, order new elections to fill them, beside other usual and permanent powers of an executive.

Arriving at Leavenworth in October, 1854, Governor Reeder was not long in discovering the designs of the Missourians. He was urged to order the immediate election of a territorial legislature.* The conspirators had already spent some months in organizing their "Blue Lodges," and now desired to be promptly put in possession of the political power of the territory. But the Governor had too much manliness to become the mere pliant tool they wished to make him. He resented their dictatorship; made a tour of inspection through the new settlements; and acting on his own proper judgment, on his return issued a proclamation for a simple election of a delegate to Congress. At the appearance of this proclamation Platte county took the alarm, and held a meeting on the Kansas side of the river, to intimidate him with violent speeches and a significant memorial. The governor retorted in a letter that the meeting was composed of Missourians, and that he should resist outside interference from friend,

foe, or faction.* Pocketing this rebuff as best they might, Senator Atchison and his "Blue Lodges" nevertheless held fast to their purpose. Paper proclamation and lectures on abstract rights counted but little against the practical measures they had matured. November 29th, the day of election for delegate, finally arrived, and with it a formidable invasion of Missouri voters at more than half the polling places appointed in the governor's proclamation.

In frontier life it was an every-day experience to make excursions for business or pleasure, singly or in parties, requiring two or three consecutive days, perhaps a night or two of camping out, and for which saddle-horses and farm-wagons furnished ready transportation; and nothing was more common than concerted neighborhood efforts for improvement, protection, or amusement. On such occasions neighborly sentiment and comity required every man to drop his axe, or unhitch from the plow in the furrow, to further the real or imaginary weal of the community. In urgent instances non-compliance was fatal

* Reeder to Gwiner and others, Nov. 21, 1854; copied into "National Era," Jan. 4, 1855.

to the peace and comfort and sometimes to the personal safety of the settler. The movement described above had been in active preparation for weeks, controlled by strong and secret combinations, and many unwilling participants were doubtless swept into it by an excited public opinion they dared not resist.

A day or two before the election the whole Missouri border was astir. Horses were saddled, teams harnessed, wagons loaded with tents, forage, and provisions, bowie-knives buckled on, revolvers and rifles loaded, and flags and inscriptions flung to the breeze by the more demonstrative and daring. Crossing the river-ferries from the upper counties, and passing unobstructed over the State line by the prairie-roads and trails from the lower, many of them camped that night at the nearest polls, while others pushed on fifty or a hundred miles to the sparsely settled election districts of the interior. As they passed along, the more scrupulous went through the empty form of an imaginary settlement, by nailing a card to a tree, driving a stake into the ground, or inscribing their names in a claim register, prepared in haste by the invading party. The more indifferent satisfied themselves with a mere mental resolve to become a settler. The utterly reckless silenced all scruples in profanity and drunkenness. On election morning the few real squatters of Kansas, endowed with Douglas's delusive boon of "popular sovereignty," witnessed with mixed indignation and terror acts of summary usurpation. Judges of election were dispossessed and set aside by intimidation or stratagem, and pro-slavery judges substituted without the slightest regard to regularity or law; judges' and voters' oaths were declared unnec-

essary, or explained away upon newly-invented phrases and absurd subtleties. "Where there's a will, there's a way," in wrong and crime, as well as in honest purpose and deed; and by more dishonest devices than history can stop fully to record the ballot-boxes were filled, through invasion, false swearing, riot, and usurpation, with ballots for Whitfield, the pro-slavery candidate for delegate to Congress, at nine out of the seventeen polling places — showing, upon a careful scrutiny afterward made by a committee of Congress, an aggregate of 1729 illegal votes, and only 1114 legal ones. This mockery of an election completed, the valiant Knights of the Blue Lodge, the fraternal members of the Social Band, the philanthropic groups of the Friends Society, and the chivalric Sons of the South mounted their horses and wagons, and with cheers, and salvos from revolver and rifle, returned to their axe and plow, society lodge and bar-room haunt, to exult in a victory for Missouri and slavery over the "Abolition hordes and nigger thieves of the Emigrant Aid Society." The "Border Ruffians" of Missouri had written their preliminary chapter in the annals of Kansas. The published statements of the

Emigrant Aid Society show that up to the date of election it had sent only a few hundred men, women, and children to the territory. Why such a prodigious effort was deemed necessary to control the votes and influence of this paltry handful of "paupers who had sold themselves to Eli Thayer and Co." was never explained.

THE BOGUS LAWS.

As THE event turned out, the invasion of border ruffians to decide the first election in Kansas had been entirely unnecessary. Even without counting the illegal votes, the pro-slavery candidate for delegate was chosen by a plurality. He had held the office of Indian Agent, and his acquaintance, experience, and the principal fact that he was the favorite of the conspirators gave him an easy victory. Governor Reeder issued his certificate of election without delay, and Whitfield hurried away to Washington to enjoy his new honors, taking his seat in the House of Representatives within three weeks after his election. Atchison, however, did not follow his example. Congress met on the first Monday of December, and the ser-

vices of the Acting Vice-President were needed in the Senate Chamber. But of such importance did he deem the success of the conspiracy in which he was the leader, that a few weeks before the session he wrote a short letter to the Senate, giving notice of his probable absence and advising the appointment of a new presiding officer.

As a necessary preliminary to organizing the government of the territory, Governor Reeder, under the authority of the organic

"popular sovereignty." But his short experience with Atchison's Border Ruffians had already rudely shaken his partisanship. The events of the November election exposed the designs of the pro-slavery conspiracy beyond all doubt or concealment, and no course was left him but to become either its ally or its enemy. In behalf of justice, as well as to preserve what he still fondly cherished as a vital party principle, he determined by every

ANDREW H. REEDER.
FROM A PHOTOGRAPH BY R. KNECHT.

act, proceeded to take a census of its inhabitants.* This work, carried on and completed in the months of January and February, 1855, disclosed a total population of 8601 souls, of whom 2905 were voters. With this enumeration as a definite guide, the governor made an apportionment, established election districts, and, appointing the necessary officers to conduct it, fixed upon the 30th of March, 1855, as the day for electing the territorial legislature. Governor Reeder had come to Kansas an ardent Democrat, a firm friend of the Pierce administration, and an enthusiastic disciple of the new Democratic dogma of

means in his power to secure a fair election. Party lines in the territory had become sharply defined upon the single issue of "free State" and "slave State." In his appointment of election officers, census-takers, justices of the peace, and constables, he was careful to make his selections from both factions as fairly as possible, excepting that, as a greater and necessary safeguard against another invasion, he designated in the several election districts along the Missouri border two "free-State" men and one pro-slavery man to act as judges at each poll. † He prescribed distinct and rigid rules for the conduct of the election; ordering

* Reeder Testimony, "Howard Report," p. 934.

† Reeder Instructions, "Howard Report," pp. 107, 935.

FIRST HOUSE AT SHAWNEE MISSION.

strong to control the election; and by these misrepresentations the whole border was wrought up into the fervor of a pro-slavery crusade. When the 30th of March, election day, finally arrived, the conspiracy had once more mustered its organized army of invasion, and five thousand Missouri Border Ruffians, in different camps, bands, and squads, held practical possession of nearly every election district in the territory.* Riot, violence, intimidation, destruction of ballot-boxes, expulsion and substitution of judges, neglect or refusal

RESIDENCE OF GOVERNOR REEDER AND STAFF, 1855.

among other things that the judges should be sworn, that constables should attend and preserve order, and that voters must be actual inhabitants to the exclusion of any other home.

All his precautions came to nought. This election of a territorial legislature, which, as then popularly believed, might determine by the enactment of laws whether Kansas should become a free or a slave State, was precisely the coveted opportunity for which the Border Ruffian conspiracy had been organized. Its interference in the November election served as a practical experiment to demonstrate its efficiency and to perfect its plans. The alleged doings of the Emigrant Aid Societies furnished a convenient and plausible pretext; wild and extravagant assertions were now circulated as to the plans and numbers of the Eastern emigrants; it was industriously reported that they were coming twenty thousand

OLD SCHOOL BUILDING OCCUPIED BY FIRST TERRITORIAL LEGISLATURE.

to administer the prescribed oaths, *viva voce* voting, repeated voting on one side, and obstruction and dispersion of voters on the other, were common incidents; no one dared to resist the assertions or acts of the invaders, since they were armed and equipped and commanded in frontier if not in military fashion, in many cases by men whose names then or afterwards were prominent or notorious. Of the votes cast, 1410 were upon a subse-

*"Howard Report," pp. 9 to 44.

quent examination found to have been legal, while 4908 were illegal.* Of the total number, 5427 votes were given to the pro-slavery and only 791 to the free-State candidates. At such an election the candidates of the conspiracy claimed to have been chosen a legislature for the territory of Kansas. Upon a careful collation of evidence the investigating committee of Congress was of the opinion that the vote would have returned a free-State legislature if the election had been confined to the actual settlers;† as conducted, however, it showed a nominal majority for every pro-slavery candidate but one.

Governor Reeder had feared a repetition of the November frauds; but it is evident that he had no conception of so extensive an invasion. It is probable, too, that information of its full enormity did not immediately reach him. Meanwhile the five days prescribed in his proclamation for receiving notices of contest elapsed. The governor had removed his executive office to Shawnee Mission. At this place, and at the neighboring town of Westport, Missouri, only four miles distant, a majority of the persons claiming to have been elected now assembled and became clamorous for their certificates.‡ A committee of their number presented a formal written demand for the same; they strenuously denied his right to question the legality of the election, and threats against the governor's life in case of his refusal to issue them became alarmingly frequent. Their regular consultations, their open denunciations, and their hints at violence, while they did not entirely overawe the governor, so far produced their intended effect upon him that he assembled a band of

REV. THOMAS JOHNSON (1860, AGED 59).
FROM AN AMBROTYPE IN POSSESSION OF HIS SON, A. MONROE JOHNSON.

his personal friends for his own protection. On the 6th of April, one week after election, the governor announced his decision upon the returns. On one side of the room were himself and his armed adherents; on the other side the would-be members in superior numbers, with their pistols and bowie-knives equally ready. Under this virtual duress the governor issued certificates of election to all but about one-third of the claimants; and the returns in these cases he rejected, not because of alleged force or fraud, but on account of palpable defects in the papers.§

This issue of certificates under a virtual

* Ibid, p. 30.

† Ibid, p. 34.

‡ Reeder's testimony, "Howard Report," pp. 935-9; also Stringfellow's testimony, p. 355.

§ Namely, because of a *viva voce* vote certified instead of a ballot, and because the prescribed oath and the words 'lawful resident voters' had been openly erased from the printed forms. In six districts the governor ordered a supplementary election, which was duly held on the 22d of May following. When that day arrived, the Border Ruffians, proclaiming the election to be illegal, by their default allowed free-State men to be chosen in all the districts except that of

Leavenworth, where the invasion and tactics of the March election were repeated now for the third time and the same candidates voted for. "Howard Report," pp. 35-36. Indeed, the Border Ruffian habit of voting in Kansas had become chronic, and did not cease for some years, and sometimes developed the grimmest humors. In the autumn of that same year an election for county-seat took place in Leavenworth county by the accidental failure of the legislature to designate one. Leavenworth city aspired to this honor and polled six hundred votes to obtain it; but it had an enterprising rival in Kickapoo city, ten miles up the river, and another, Delaware city, eight miles down stream. Both

FOUNDATION OF THE OLD TERRITORIAL CAPITAL, LECOMPTON—LANE UNIVERSITY IN THE BACKGROUND. (SEE PAGE 880.)

compulsion was a fatal error in Governor Reeder's action. It endowed the notoriously illegal legislature with a technical authority, and a few weeks later, when he went to Washington City to invoke the help of the Pierce administration against the usurpation, it enabled Attorney-General Cushing (if current report was true) to taunt him with the reply, "You state that this legislature is the creature of force and fraud; which shall we believe—your official certificate under seal, or your subsequent declarations to us in private conversation?"

The question of the certificates disposed of, the next point of interest was to determine at what place the legislature should assemble. Under the organic act the governor had authority to appoint the first meeting, and it soon became known that his mind was fixed upon the embryo town of Pawnee, adjoining the military post of Fort Riley, situated on Kansas River, a hundred and ten miles from

were paper towns—"cottonwood towns," in border slang—of great expectations: and both having more unscrupulous enterprise than voters, appealed to Platte county to "come over." This was an appeal Platte county could never resist, and accordingly a chartered ferry-boat brought voters all election day from the Missouri side, until the Kickapoo tally-lists scored eight hundred and fifty. Delaware city, however, was not to be thus easily crushed. She too not only had her chartered ferry-boat, but kept her polls open for three days in succession, and not until her boxes contained nine hundred ballots (of which only fifty were

the Missouri line. Against this exile, however, Stringfellow and his Border Ruffian law-makers protested in an energetic memorial, asking to be called together at the Shawnee Mission, supplemented by the private threat that even if they convened at Pawnee, they would adjourn and come back the day after.* If the governor harbored any remaining doubt that this bogus legislature intended to assume and maintain the mastery, it speedily vanished. Their hostility grew open and defiant; they classed him as a free-State man, an "abolitionist," and it became only too evident that he would gradually be shorn of power and degraded from the position of territorial executive to that of a mere puppet. Having nothing to gain by further concession, he adhered to his original plan, issued his proclamation† convening the legislature at Pawnee on the first Monday in July, and immediately started for Washington to make a direct appeal to President Pierce.

probably legal) did the steam whistle scream victory! When the "returning board" had sufficiently weighed this complicated electoral contest, it gravely decided that keeping the polls open for three days was "an unheard of irregularity." (Holloway's "History of Kansas," pp. 192-4). This was exquisite irony; but a local court on appeal seriously giving a final verdict for Delaware, the transaction became a perennial burlesque on "Squatter Sovereignty."

* "Squatter Sovereign," June 5th, 1855.

† April 16th, 1855.

How Governor Reeder failed in this last hope of redress and support, how he found the Kansas conspiracy as strong at Washington as on the Missouri border, will appear further along. On the second of July the governor and the legislature met at the town of Pawnee, where he had convoked them—a magnificent prairie site, but containing as yet only three buildings, one to hold sessions in, and two to furnish food and lodging. The governor's friends declared the accommodations ample; the Missourians on the contrary made affidavit that they were compelled to camp out and cook their own rations. The actual facts had little to do with the predetermination of the members. Stringfellow had written in his paper, the "*Squatter Sovereign*," three weeks before, "We hope no one will be silly enough to suppose the governor has power to compel us to stay at Pawnee during the entire session. We will, of course, have to 'trot' out at the bidding of his Excellency,—but we will trot him back next day at our bidding."*

The prediction was literally fulfilled. Both branches organized without delay, the House choosing John H. Stringfellow its Speaker. Before the governor's message was delivered on the following day, the House had already passed, under suspended rules, "An act to remove the seat of government temporarily to the Shawnee Manual Labor School,"† which act the council as promptly concurred in.‡ The governor vetoed the bill, but it was at once passed over his veto.§ By the end of the week the legislature had departed from the budding capital, to return no more.||

The governor was perforce obliged to follow his migratory Solons, who adhered to their purpose despite his public or private protests, and who reassembled at Shawnee Mission, or more correctly the Shawnee Manual Labor School, on the 16th of July. Shawnee Mission was one of our many national experiments in civilizing Indian tribes. This philanthropic institution, nourished by the Federal treasury, was presided over by the Rev. Thomas Johnson. The town of Westport, which could boast of a post-office, lay only four miles to the eastward, on the Missouri side of the State line, and was a noted pro-slavery stronghold. There were several large brick buildings at the

Mission capable of accommodating the legislature with halls and lodging rooms; its nearness to an established post-office and its contiguity to Missouri pro-slavery sentiment were elements probably not lost sight of. Mr. Johnson, who had formerly been a Missouri slaveholder, was at the March election chosen a member of the Territorial Council, which in due time made him its presiding officer; and the bogus legislature at Shawnee Mission was therefore in a certain sense under its own "vine and fig-tree."

The two branches of the legislature, the Council with the Rev. Thomas Johnson as President, and the House with Stringfellow of the "*Squatter Sovereign*" as Speaker, now turned their attention seriously to the pro-slavery work before them. The conspirators were shrewd enough to realize their victory. "To have intimated one year ago," said the Speaker in his address of thanks, "that such a result would be wrought out, one would have been thought a visionary; to have predicted that to-day a legislature would assemble, almost unanimously pro-slavery, and with myself for Speaker, I would have been thought mad."¶ The programme had already been announced in the "*Squatter Sovereign*" some weeks before. "The South must and will prevail. If the Southern people but half do their duty, in less than nine months from this day Kansas will have formed a constitution and be knocking at the door for admission. . . . In the session of the United States Senate in 1856, two Senators from the slaveholding State of Kansas will take their seats, and abolitionism will be forever driven from our halls of legislation."** Against this triumphant attitude Governor Reeder was despondent and powerless. The language of his message†† plainly betrayed the political dilemma in which he found himself caught. He strove as best he might to couple together the prevailing cant of office-holders against "the destructive spirit of abolitionism" and a comparatively mild rebuke of the Missouri usurpation.‡‡

Nevertheless, the governor stood reasonably firm. He persisted in declaring that the legislature could pass no valid laws at any other place than Pawnee, and returned the first bill sent him with a veto message to that effect. To this the legislature replied by passing the bill over his veto, and in addition formally

‡‡ Its phraseology was adroit enough to call forth a sneering compliment from Speaker Stringfellow, who

wrote to the "*Squatter Sovereign*": "On Tuesday the governor sent in his message, which you will find is very well calculated to have its effect with the Pennsylvania Democracy. If he was trustworthy I would be disposed to compliment the most of it, but knowing how corrupt the author is, and that it is only designed for political effect in Pennsylvania, he not expecting to remain long with us, I will pass it by."—"Squatter Sovereign," July 17th, 1855.

raising a joint committee "to draw up a memorial to the President of the United States respectfully demanding the removal of A. H. Reeder from the office of governor";* and, as if this indignity were not enough, holding a joint session for publicly signing it. The memorial was promptly dispatched to Washington by special messenger; but on the way this envoy read the news of the governor's dismissal by the President.

This event appeared definitely to sweep away the last obstacle in the path of the conspirators. The office of acting governor now devolved upon the Secretary of the Territory, Daniel Woodson, a man who shared their views and was allied in their schemes. With him to approve their enactments, the parliamentary machinery of the "bogus" legislature was complete and effective. They had at the very beginning summarily ousted the free-State members chosen at the supplementary election of May 22d, and seated the pro-slavery claimants of March 30th; and the only two remaining free-State members resigned in utter disgust and despair, and to avoid giving countenance to the flagrant usurpation by their presence. No one was left even to enter a protest.

This, then, was the perfect flower of Douglas's vaunted experiment of "popular sovereignty,"—a result they professed fully to appreciate. "Hitherto," said the Judiciary Committee of the House in a long and grandiloquent report,† "Congress have retained to themselves the power to mold and shape all the territorial governments according to their own peculiar notions, and to restrict within very limited and contracted bounds both the natural as well as the political rights of the bold and daring pioneer and the noble, hard-fisted squatter." But by this course, the argument of the committee continued, "the pillars which uphold this glorious union of States were shaken until the whole world was threatened with a political earthquake," and "the principle that the people are capable of self-government would have been forever swallowed up by anarchy and confusion," had not the Kansas-Nebraska bill "delegated to the people of these territories the right to frame and establish their own form of government."

What might not be expected of law-makers who begin with so ambitious an exordium, and who lay the corner-stone of their edifice upon the solid rock of political principle? The anti-climax of performance which followed this philosophical promise would be laughably absurd, indeed, were it not marked by the cunning of a well-matured political plot. Their first step was to recommend the repeal of "all laws whatsoever, which may have been considered to have been in force" in this territory on the 1st day of July, 1855, thus forever quieting any doubt "as to what is and what is not law in this territory";‡ secondly, to substitute a code about which there should be no question, by the equally ingenious expedient of copying and adopting the Revised Statutes of Missouri.§

These enactments were made in due form; but the "bogus" legislature did not seem content to let its fame rest on this single monument of self-government. Casting their eyes once more upon the broad expanse of American politics, the Judiciary Committee reported:

"The question of slavery is one that convulses the whole country, from the boisterous Atlantic to the shores of the mild Pacific. This state of things has been brought about by the fanaticism of the North and East, while up to this time the people of the South, and those of the North who desire the perpetuation of this Union and are devoted to the laws, have been entirely conservative. But the time is coming—yea, it has already arrived—for the latter to take a bold and decided stand that the Union and law may not be trampled in the dust,"|| etc., etc.

The "Revised Statutes of Missouri," recommended in bulk, and adopted with hasty clerical modifications,¶ already contained the usual slave-code peculiar to Southern States. But in the plans and hopes of the conspirators, this of itself was insufficient. In order to "take a bold stand that the Union and law might not be trampled in the dust," they with great painstaking devised and passed "an act to punish offenses against slave property."**

It prescribed the penalty of death, not merely for the grave crime of inciting or aiding an insurrection of slaves, free negroes, or mulattoes, or circulating printed matter for such an object, but also the same extreme punishment for the comparatively mild offense of enticing or decoying away a slave

¶ To guard more effectually against clerical errors, the legislature enacted: "Sec. 1. Wherever the word 'State' occurs in any act of the present legislative assembly, or any law of this territory, in such construction as to indicate the locality of the operation of such act or laws, the same shall in every instance be taken and understood to mean 'territory,' and shall apply to the territory of Kansas."—"Statutes of Kansas," 1855, p. 718.]

** "Statutes Territory of Kansas," 1855, p. 715.

or assisting him to escape; for harboring or concealing a fugitive slave, ten years' imprisonment; for resisting an officer arresting a fugitive slave, two years' imprisonment.

If such inflictions as the foregoing might perhaps be tolerated upon the plea that a barbarous institution required barbarous safeguards, what ought to be said of the last three sections of the act which, in contempt of the Declaration of Independence and the Constitution of the United States, annulled the freedom of speech and the freedom of the press, and invaded even the private sanctity of individual conscience?

To write, print, or circulate "any statements, arguments, opinions, sentiment, doctrine, advice, or innuendo, calculated to produce a disorderly, dangerous, or rebellious disaffection among the slaves of the territory, or to induce such slaves to escape from the service of their masters, or to resist their authority," was pronounced a felony and punishable by five years' imprisonment. To deny the right of holding slaves in the territory, by speaking, writing, printing, or circulating books or papers, was likewise made a felony, punishable by two years' imprisonment. Finally it was enacted that "no person who is conscientiously opposed to holding slaves, or who does not admit the right to hold slaves in this territory, shall sit as a juror on the trial of any prosecution for any violation of any of the sections of this act." Also, all officers were, in addition to their usual oath, required to swear to support and sustain the Kansas-Nebraska Act and the Fugitive-Slave Law.*

The spirit which produced these despotic laws also governed the methods devised to enforce them. The legislature proceeded to elect the principal officers of each county, who in turn were empowered by the laws to appoint the subordinate officials. All administration, therefore, emanated from that body, reflected its will, and followed its behest. Finally, the usual skeleton organization of a territorial militia was devised, whose general officers were in due time appointed by the acting governor from prominent and serviceable pro-slavery members of the Legislature.†

Having made their present domination secure, they did not omit to provide as well as lay in their power to perpetuate their political ascendancy in the territory. They ingeniously prolonged the tenure of their various appointees, and to render their success at future elections easy and certain they provided that candidates to be eligible, and judges of election, and voters when challenged, must swear

to support the Fugitive-Slave Law.‡ This they knew would virtually disfranchise many conscientious antislavery men; while, on the other hand, they enacted that each inhabitant who had paid his territorial tax should be a qualified voter for all elective officers. Under so lax a provision Missouri invaders could in the future, as they had done in the past, easily give an apparent majority at the ballot-box for all their necessary agents and ulterior schemes.

In a technical sense the establishment of slavery in Kansas was complete. There were by the census of the previous February already some two hundred slaves in the territory. Under the sanction of these laws, and before they could by any possibility be repealed, some thousands might be expected, especially by such an organized and united effort as the South could make to maintain the vantage ground already gained. Once there, the aggressiveness of the institution might be relied on to protect itself, since all experience had shown that under similar conditions it was almost ineradicable.

After so much patriotic endeavor on the part of these Border Ruffian legislators "that the Union and law may not be trampled in the dust," it cannot perhaps be wondered at that they began to look around for their personal rewards. These they readily found in the rich harvest of local monopolies and franchises which lay scattered in profusion on this virgin field of legislation, ready to be seized and appropriated without dispute by the first occupants. There were charters for railroads, insurance companies, toll-bridges, ferries, coal mines, plank roads, and numberless privileges and honors of present or prospective value out of which, together with the county, district and military offices, the ambitious members might give and take with generous liberality. One-sixth of the printed laws of the first session attest their modest attention to this incidental squatter's dowry.§ One of the many favorable opportunities in this category was the establishment of the permanent territorial capital, authorized by the organic act, where the liberal Federal appropriation for public buildings should be expended. For this purpose, competition from the older towns yielding gracefully after the first ballot, an entirely new site on the open prairie overlooking the Kansas River some miles west of Lawrence was agreed upon. The proceedings do not show any unseemly scramble over the selection, and no tangible record remains of the whispered distribution of corner lots and

§ Colfax, Speech in H. R. June 21st, 1856.

contracts. It is only the name which rises into historical notice.

One of the actors in the political drama of Kansas was Samuel Dexter Lecompte, Chief Justice of the territory. He had been appointed from the border State of Maryland, and is represented to have been a diligent student, a respectable lawyer, a prominent Democratic politician, and possessed of the personal instincts and demeanor of a gentleman. Moved by a pro-slavery sympathy none the less objectionable that it may have been sincere, Judge Lecompte lent his high authority to the interests of the conspiracy against Kansas. He had already rendered the bogus legislature the important service of publishing an extra-judicial opinion, sustaining their adjournment from Pawnee to Shawnee Mission.* Probably because they valued his official championship and recognized in him a powerful ally in politics, they made him a member of several of their private corporations, and gave him the conspicuous honor of naming their newly-founded capital Lecompton. But the intended distinction was transitory. Before the lapse of a single decade, the town for which he stood sponsor was no longer the capital of Kansas.

THE TOPEKA CONSTITUTION.

THE bogus legislature adjourned late on the night of the 30th of August, 1855. They had elaborately built up their legal despotism, commissioned trusty adherents to administer it, and provided their principal and undoubted partisans with military authority to see that it was duly executed. Going still a step further, they proposed so to mold and control public opinion as to prevent the organization of any party or faction to oppose their plans. In view of the coming Presidential campaign, it was the fashion in the States for Democrats to style themselves "National Democrats"; and a few newspapers and speakers in Kansas had adopted the prevailing political name. To stifle any such movement, both houses of the legislature on the last night of their session adopted a concurrent resolution declaring that the proposition to organize a National Democratic party, having already misled some of their friends, would divide pro-slavery Whigs from Democrats and weaken their party one-half; that it was the duty of the pro-slavery, Union-loving men of Kansas "to know but one issue, slavery; and that any party making or attempting to make any other should be held as an ally of abolitionism and disunion."†

* "House Journal Kansas Territory," 1855. Appendix, p. 3.

Had the conspiracy been content to prosecute its designs through moderate measures, it would have inevitably fastened slavery upon Kansas. The organization of the invasion in western Missouri, carried on under pre-acknowledged leadership, in populous counties, among established homes, amid well-matured confidence growing out of long personal and political relationship, would have been easy even without the powerful bond of secret association. On the other hand, the union of the actual inhabitants of Kansas, scattered in sparse settlements, personal strangers to each other, coming from widely separated States, and comprising radically different manners, sentiments, and traditions, and burdened with the prime and unyielding necessity of protecting themselves and their families against cold and hunger, was in the very nature of the case slow and difficult. But the course of the Border Ruffians created a powerful and determined opposition, which now became united in support of what is known to history as the Topeka Constitution; or, in other words, the free-State party of Kansas.

It is a noteworthy historic incident that this free-State movement originated in Democratic circles, under Democratic auspices. The Republican party did not yet exist. The opponents of the Kansas-Nebraska Act were demoralized and scattered among the Whigs, Know-Nothings, and Free-soilers in the States, and had no national affiliation, although they had won overwhelming triumphs in a majority of the Congressional districts in the fall elections of 1854. It so happened that nearly if not quite all the free-State leaders originally went to Kansas as friends of President Pierce, and as believers in the dogma of "popular sovereignty."

Now that this usurping legislature had met, contemptuously expelled the free-State members, defied the governor's veto, set up its ingeniously contrived legal despotism, and commissioned its partisan followers to execute and administer it, the situation became sufficiently grave to demand defensive action. The real settlers were Democrats, it was true; they had voted for Pierce, shouted for the platform of '52, applauded the Kansas-Nebraska Act, and emigrated to the territory to enjoy the new political gospel of popular sovereignty. But the practical Democratic beatitudes of Kansas were not calculated to strengthen the saints or confirm them in the faith. A Democratic invasion had elected a Democratic legislature, which enacted Democratic laws, under whose practical "non-intervention" a

† "House Journal Kansas Territory," 1855, p. 380; "Council Journal," 1855, p. 253.

Democratic marshal bringing a writ from a Democratic judge might fasten a ball and chain to their ankles if they should happen to read the Declaration of Independence to a negro, or carry Jefferson's "Notes on Virginia" in their carpet-bags. Neither Kansas Democrats nor Northern State Democrats could tolerate or defend such open outrages upon right and decency.

The official resolution which the bogus legislature now proclaimed as a final political test left no middle ground between those who were for slavery and those who were against slavery—those who were for the bogus laws in all their enormity, and those who were against them. Before this pressure, doubt, hesitation, party bias, and personal jealousy gradually melted away, and all who were not willing to become active co-workers with the conspiracy were forced to combine in self-defense.

It was in the town of Lawrence that the free-State movement naturally found its beginning. The settlers of the Emigrant Aid Society were comparatively few in number; but supported by money, saw-mills, printing-presses, boarding-houses, they became from the very first a compact, self-reliant governing force. A few preliminary meetings, instigated by the disfranchised free-State members of the legislature, brought together a large mass convention. The result of its two days' deliberations was a regularly chosen delegate convention held at Big Springs, a few miles west of Lawrence, on the 5th of September, 1855. All doubt and hesitation on the part of the leaders had by this time vanished. More important than all, perhaps, was the presence and active participation of Ex-Governor Reeder himself, who wrote the resolutions, addressed the convention in a stirring and defiant speech, and received by acclamation their nomination for territorial delegate. The platform adopted repudiated in strong terms the bogus legislature and its tyrannical enactments, and declared "that we will endure and submit to these laws no longer than the best interests of the territory require, as the least of two evils, and will resist them to a bloody issue as soon as we ascertain that peaceable remedies shall fail," etc. It also

recommended the formation of volunteer companies and the procurement of arms. The progressive and radical spirit of the convention is illustrated in its indorsement of the free-State movement, against the report of its own committee. The strongest point, however, made by the convention was a determination, strictly adhered to for more than two years, to take no part in any election under the bogus territorial laws. As a result Whitfield received, without competition, the combined pro-slavery and Border Ruffian vote for delegate on the first of October, a total of 2721 ballots. Measures had meanwhile been perfected by the free-State men to elect delegates to a constitutional convention. On the 9th of October, at a separate election, held by the free-State party alone, under self-prescribed formalities and regulations, these were duly chosen by an aggregate vote of 2710, Ex-Governor Reeder receiving at the same polls 2849 votes for delegate.

By this series of political movements, carried out in quiet and orderly proceedings, the free-State party was not only fully constituted and organized, but was demonstrated to possess a decided majority in the territory. Still following out the policy agreed upon, the delegates chosen met at Topeka on the 23d of October, and with proper deliberation and decorum framed a State Constitution, which was in turn submitted to a vote of the people. Although this election was held near midwinter (Dec. 15th, 1855), and in the midst of serious disturbances of the peace arising from other causes, it received an affirmative vote of 1731, showing a hearty popular indorsement of it. Of the document itself no extended criticism is necessary. It prohibited slavery, but made reasonable provision for existing property-rights in slaves actually in the territory. In no sense a radical, subversive, or "abolition" production, the Topeka Constitution was remarkable only as being the indignant protest of the people of the territory against the Missouri usurpation.* The new constitution was transmitted to Congress and was formally presented as a petition to the Senate † by General Cass, on March 24, 1856, ‡ and to the House some days later.

The Republican Senators in Congress (the

* Still another election was held by the free-State party on January 15th, 1856, to choose State officers to act under the new organization, at which Charles Robinson received 1296 votes for governor, out of a total of 1706, and Mark W. Delahay for Representative in Congress, 1628. A legislature elected at the same time, met, according to the terms of the newly framed constitution, on the 4th of March, organized, and elected A. H. Reeder and Jas. H. Lane United States Senators.

† "Congressional Globe," 1856, March 24th, p. 698.

‡ Later, on April 7th, General Cass presented to the Senate another petition, purporting to be the Topeka Constitution, which had been handed him by J. H. Lane, president of the convention which framed it and Senator-elect under it ("Cong. Globe," 1856, April 7, p. 826). This paper proved to be a clerk's copy, with erasures and interlineations and signatures in one handwriting, which being questioned as probably spurious, Lane afterward supplied the original draft prepared by the committee and adopted by the convention, though without signatures; also adding his

Republican party had been definitely organized a few weeks before at Pittsburg)* now urged the immediate reception of the Topeka Constitution and the admission of Kansas as a free State, citing the cases of Michigan, Arkansas, Florida, and California as justifying precedents.† For the present, however, there was no hope of admission to the Union with the Topeka Constitution. The Pierce administration, under the domination of the Southern States, had deposed Governor Reeder. Both in his annual message and again in a special message, the President denounced the Topeka movement as insurrectionary. In the Senate, too, the application was already prejudged; the Committee on Territories through Douglas himself as chairman, in a long partisan report, dismissed it with the assertion "that it was the movement of a political party instead of the whole body of the people of Kansas, conducted without the sanction of law, and in defiance of the constituted authorities, for the avowed purpose of overthrowing the territorial government established by Congress."‡ In the mouth of a consistent advocate of "popular sovereignty" this argument might have had some force; but it came with a bad grace from Douglas, who in the same report indorsed the bogus legislature and sustained the bogus laws upon purely technical assumptions. Congress was irreconcilably divided in politics. The Democrats had an overwhelming majority in the Senate; the opposition, through the election of Speaker Banks, possessed a working control of the House. Some months later, after prolonged debate, the House passed a bill for the admission of Kansas under the Topeka Constitution; but as the Senate had already rejected it, the movement remained without practical result.§

The staple argument against the Topeka free-State movement, that it was a rebellion

against constitutional authority, though perhaps correct as a mere theory was utterly refuted by the practical facts of the case. The Big Springs resolutions, indeed, counseled resistance to a "bloody issue"; but this was only to be made after "peaceable remedies shall fail." History must credit the free-State leaders with the high renown of pursuing their peaceable remedies and forbearing to exercise their asserted right to resistance with a patience unexampled in American annals. The bogus territorial laws were defied by the newspapers and treated as a dead letter by the mass of the free-State men; as much as possible they stood aloof from the civil officers appointed by and through the bogus legislature, recorded no title papers, began no lawsuits, abstained from elections, and denied themselves privileges which required any open recognition of the alien Missouri statutes. Lane and others refused the test oath, and were excluded from practice as attorneys in the courts; free-State newspapers were thrown out of the mails as incendiary publications; sundry petty persecutions were evaded or submitted to as special circumstances dictated. But throughout their long and persistent non-conformity, for more than two years, they constantly and cheerfully acknowledged the authority of the organic act, and of the laws of Congress, and even counseled and endured every forced submission to the bogus laws. Though they had defiant and turbulent spirits in their own ranks, who often accused them of imbecility and cowardice, they maintained a steady policy of non-resistance, and, under every show of Federal authority in support of the bogus laws, they submitted to obnoxious searches and seizures, to capricious arrest and painful imprisonment, rather than by resistance to place themselves in the attitude of deliberate out-laws.||

They were destined to have no lack of

explanatory affidavit ("Cong. Globe," App., 1856, pp. 378-9), to the effect that the committee had devolved upon him the preparation of the formal copy, but that the original signatures had been mislaid. The official action of the Senate appears to have concerned itself exclusively with the copy presented by General Cass on March 24th. Lane's copies served only as texts for angry debate. As the Topeka Constitution had no legal origin or quality, technical defects were of little consequence, especially in view of the action by the free-State voters of Kansas at their voluntary elections for delegates on October 9th, and to ratify it on December 15th, 1856.

* February 22d, 1856.

† They based their appeal specially upon the opinion of the Attorney-General in the case of Arkansas, that citizens of territories possess the constitutional right to assemble and petition Congress for the redress of grievances; that the form of the petition is immaterial; and that "as the power of Congress over the whole subject is plenary, they may accept any constitution,

however framed, which in their judgment meets the sense of the people to be affected by it."

‡ Douglas, Senate Report of March 12th, 1856, p. 32.

§ Nevertheless, the efforts of the free-State party under this combination were not wholly barren. The contest between Whitfield and Reeder for a seat in the House as territorial delegate not only provoked searching discussion, but furnished the occasion for sending an investigating committee to Kansas, attended by the contestants in person. This committee with a fearless diligence collected in the territory, as well as from the border counties of Missouri, a mass of sworn testimony amounting to some twelve hundred printed pages, and which exposed the Border Ruffian invasions and the Missouri usurpation in all their monstrous iniquity, and officially revealed to the astounded North, for the first time and nearly two years after its beginning, the full proportions of the conspiracy.

|| See Governor Robinson's message to free-State Legislature, March 4th, 1856. Mrs. Robinson's "Kansas," pp. 352 and 364.

provocation. Since the removal of Reeder, all the Federal officials of the territory were affiliated with the pro-slavery Missouri cabal. Both to secure the permanent establishment of slavery in Kansas, as well as to gratify the personal pride of their triumph, they were determined to make these recusant free-State voters "bow down to the cap of Gessler." Despotism is never more arrogant than in resenting all insults to its personal vanity. As a first and necessary step, the cabal had procured, through its powerful influence at Washington, a proclamation from the President commanding "all persons engaged in unlawful combinations against the constituted authority of the territory of Kansas or of the United States to disperse," etc.* The language of the proclamation was sufficiently comprehensive to include Border Ruffians and emigrant aid societies, as well as the Topeka movement, and thus presented a show of impartiality; but under dominant political influences the latter was its evident and certain object.

With this proclamation as a sort of official fulcrum, Chief-Justice Lecompte delivered at the May term of his court a most extraordinary charge to the grand jury. He instructed them that the bogus legislature, being an instrument of Congress, and having passed laws, "those laws are of United States authority and making." Persons resisting these laws must be indicted for high treason. If no resistance has been made, but combinations formed for the purpose of resisting them, "then must you still find bills for constructive treason, as the courts have decided that the blow need not be struck, but only the intention be made evident."† Indictments, writs, and the arrest of many prominent free-State leaders followed as a matter of course. All these proceedings, too, seem to have been a part of the conspiracy. Before the indictments were found, and in anticipation of the writs, Robinson, the free-State governor-elect, then on his way to the East, was arrested while traveling on a Missouri River steamboat, at Lexington in that State, detained, and finally sent back to Kansas under the governor's requisition. Upon this frivolous charge of constructive treason he and others were held in military custody nearly four months, and finally, at the end of that period, discharged upon bail, the farce of longer imprisonment having become useless through other events.

Apprehending fully that the Topeka move-

ment was the only really serious obstacle to their success, the pro-slavery cabal, watching its opportunity, matured a still more formidable demonstration to suppress and destroy it. The provisional free-State legislature had, after organizing on the 4th of March, adjourned, to reassemble on the 4th of July, 1856, in order to await in the mean time the result of their application to Congress. As the national holiday approached, it was determined to call together a mass meeting at the same time and place, to give both moral support and personal protection to the members. Civil war, of which further mention will be made in the next chapter, had now been raging for months, and had in its general results gone against the free-State men. Their leaders were imprisoned or scattered, their presses destroyed, their adherents dispirited with defeat. Nevertheless, as the day of meeting approached, the remnant of the legislature and some six to eight hundred citizens gathered at Topeka, though without any definite purpose or pre-arranged plan. Governor Shannon, the second of the Kansas executives, had by this time resigned his office, and Secretary Woodson was again acting governor. Here was a chance to put the free-State movement pointedly under the ban of federal authority which the cabal determined not to neglect. Reciting the President's proclamation of February, Secretary Woodson now issued his own proclamation forbidding all persons claiming legislative power and authority as aforesaid from assembling, organizing, or acting in any legislative capacity whatever. At the hour of noon on the 4th of July several companies of United States dragoons, which were brought into camp near town in anticipation of the event, entered Topeka in military array, under command of Colonel Sumner. A line of battle was formed in the street; cannon were planted, and the machinery of war prepared for instant action. Colonel Sumner, a most careful and conscientious officer and a free-State man at heart, with due formality, with decision and firmness, but at the same time openly expressing the painful nature of his duty, commanded the legislature, then about to assemble, to disperse. The members, not yet organized, immediately obeyed the order, having neither the will nor the means to resist it. There was no tumult, no violence, but little protest even in words. It might have been, instead of a real event, merely a holiday parade enacting a travesty of the Declaration of Independence. There were cheers for Sumner, cheers for Robinson, cheers for liberty, from the free-State men assembled; but the despotic purpose, clothed in forms of law, made a none the less profound impression upon the assem-

* February 11th, 1856. "Statutes at Large," Vol. XI., p. 791.

bled citizens, and later, when the newspapers spread the report of the act, upon the indignant public mind of the Northern States of the Union.

From this time onward, other events of paramount historical importance supervene to crowd the Topeka Constitution out of view. In a feeble way the organization still held together for a considerable length of time. About a year later the legislature again went through the forms of assembling, and although Governor Walker was present in Topeka, there were no proclamations, no dragoons, no can-

non, because the cabal was for the moment defeated and disconcerted and bent upon other and still more desperate schemes. The Topeka Constitution was never received nor legalized; its officers never became clothed with official authority; its scrip was never redeemed; yet in the fate of Kansas and in the annals of the Union at large it was a vital and pivotal transaction, without which the great conflict between freedom and slavery, though perhaps neither avoided nor delayed, might have assumed altogether different phases of development.

THE ENCHANTRESS.

IN a land beyond the ocean,
In the ages long ago,
Lived a lady like a lily,
With a breast and brow of snow.
From far countries, kings and princes
To behold her beauty came;
And it pleased her that they loved her,
To whom love was but a name.

Gallant knights with plumes and pennons,
Pallid beggars at the door —
On whomever fell her glances
They were lost forevermore.
And they died of hopeless passion,
Or they lived her abject slaves;
So the air was full of sighing,
And the hilltops thick with graves.

But one day unto the gateway
Of her palace came a youth,
With a length of golden tresses
And a face as fair as truth.
Not to pay her beauty homage,
And to fall beneath its spell,
Did he come; but he was weary,
So he rested by the well.

Riding forth that summer morning
With a merry cavalcade,
The enchantress saw him sleeping
By the fountain, in the shade.
As she passed with tinkling harness,
She looked down in sweet surprise,
And he lifted silken lashes
From his blue and starry eyes.

All that day with knights and maidens,
Through the forest arches dim,
Rode she in a happy silence
And a blissful dream of him.
And at eve returning, eager
Leaning forward from her place,
Sought the gleam of golden tresses
At the crystal fountain's base.

But its waters sparkled coldly
In the moonbeams, chill and wan,
And a nightingale sung near it,
But the youth — the youth was gone!
Yet upon his stony pillow
He had carved in letters deep
"Love" — his name — and to her chamber
The enchantress passed to weep.

Nevermore beneath the eagles
O'er the gateway carved bold,
Rode she forth to pain or pleasure,
Rode she forth in heat or cold.
But she paced the narrow limits
Of her marble courts by day,
And upon a restless pillow
Wept the weary night away.

Travelers passing by the portal
Used to tell in after years
Of a wan and white-haired woman
Wasted with a life of tears.
Aged crones would wisely whisper:
"Through the land her praises rung,
And men called her the enchantress,
In the days when we were young."

xv.

T was deeply exasperating to the soul of J. Weatherby Stull to find that his tact and cunning had been overmatched, and his important secret discovered by that wily-souled old farmer, Enoch Bullripple. To many men this defeat would have been humiliating, but Mr. Stull could not be humiliated; he was simply enraged and filled with a desire for vengeance.

The advantage which Mr. Bullripple had gained over him with regard to the future prospects of John People troubled Mr. Stull not at all. In fact he was glad to make John a partner with a very small interest in the Vatoldi concern, and probably would have done so some day of his own accord. This position secured John's secrecy concerning the identity of the principal owner, for the young man had been made to understand thoroughly that in case of bad faith on his part the business would be brought to a sudden close. Regarding the old man's possession of the secret Mr. Stull felt perfectly safe. Enoch Bullripple had promised him before the agreement with John had been concluded that he would never divulge the fact that Mr. Stull owned Vatoldi's; and when Enoch Bullripple had given his word, Mr. Stull knew that it would be kept. In fact the secret was much safer when Enoch knew it and promised to keep it than when unknown to him and the subject of his prying curiosity.

But his satisfaction in regard to this phase of the affair made no difference in Stull's feelings towards the old scoundrel who, with unparalleled effrontery, had laid his sacrilegious hands upon that thing of inestimable worth, the product of years of thought and experience, the Vatoldi system. In his vandalic operations Enoch had shown such fiendish ingenuity that Mr. Stull felt sure he must for some time have suspected the identity of the man against whose peace of mind his machinations were directed, and that he was thus endeavoring, in some degree, to take a spiteful vengeance on Mr. Stull for that gentleman's acquisition, perfectly legal and proper, of his sister's farm.

That Enoch Bullripple should suffer for his malicious wrong-doing, Mr. Stull was fully determined, and he believed he had tact enough to ruin the old farmer, and yet give him no reason to believe that he had anything to do with it.

With all this arranged and ordered in his very orderly mind, Mr. Stull found himself once more in buoyant and cheerful spirits. He had work before him, and he was glad to do it. With regard to Vatoldi's his action would be prompt and vigorous. The place had been desecrated, and the most radical measures would be necessary to place it again upon its former footing. The boycotters, who had been much disheartened by the changes that had taken place under the Bullripple administration, were encouraged to fresh efforts by the return of John People to his post. They imagined that his absence had been a ruse to make them suppose that the business had passed into other hands, and they determined to show Mr. People that they were not to be deterred by such tricks as that.

But little Mr. Stull cared now for the boycotters. With his faithful manager again at his command, and with Vatoldi's, such as it used to be, absolutely gone and vanished, so that no thought of interference with its orderly system and its prosperity need prevent his making any change he might choose, he decided upon a bold step. He would close up the place, renovate, beautify, and enlarge it, and reopen it as the old Vatoldi's invigorated with fresh youth. All the circumstances of the case were in his favor. It was the season when the patrons he most cared for were out of town. A large adjoining store on which he had for years cast longing eyes was now at his disposal, and, above all, there was no better way to cleanse the establishment from its recent contaminations than to blot it out of existence for a time, and then re-create it in its old form.

Accordingly the firemen-waiters were discharged, the business was closed up, and when some boycotters arrived with a quantity of new circulars printed on bright red paper, they found the shutters up, and the door locked, and a notice posted, which stated that in

consequence of extensive alterations and enlargements the establishment would be closed for some weeks. This put an end to the boy-cotting business. The body of former waiters, who for some time had been regretting that they had not been willing to stick to their aprons and jackets, had been lately assured by their leader that John People's running away and coming back was a sign of weakness, and that a fresh attack upon him would surely be successful. They now lost all hope. Their strike had brought a great deal of privation upon them. Even supposing their action had been the real cause of the closing of the establishment, it had not been of the least benefit to themselves. Having now nothing to fight against, they determined to go to work as soon as they could; but, before doing so, they took the man who had led them into all their troubles into a lonely back yard, and after giving him a most unanimous beating, they emptied upon him two barrels of ashes, and would have provided him with sackcloth if they had supposed it would add to the gloominess of his reflections.

Through John People, Mr. Stull now arranged with contractors for his intended improvements; and when all the plans had been made, and everything prepared for the beginning of the work, Mr. Stull thought it a suitable time to give John the holiday for which his uncle had stipulated. During the preliminary demolitions of partitions, and tearing up of floors, and carting away of rubbish, the contractors would need no supervision. But when the new work was actually begun, Mr. Stull would wish his managing partner to be on hand to make daily reports, and receive daily instructions.

The usually serene John had been very angry during his brief sojourn in the South, and when he returned he had not hesitated to tell his uncle what he thought of the trick which had been played upon him. But old Enoch had received his nephew's reproaches with such imperturbability, and had taken such immediate and decided steps for the furtherance of the young man's business prosperity, that the latter could not but forgive him. With nothing, therefore, to cast a cloud upon the radiant skies of his holiday, John repaired to the scenes of his boyhood.

Mr. Stull's family usually went into the country as early in the season as any other fashionable people, but this year the domestic economies had been very much interfered with by the Vatoldi disturbances, and the family was still in town. For reasons of his own Mr. Stull determined not to go to a watering-place but to the farm which he owned in the pleasant region of Cherry Bridge. His wife and daugh-

ters were ready to leave town much sooner than he himself desired to go, and they were therefore dispatched in company with their voluminous baggage, to take possession of the apartments that had been prepared for the family in the house of the tenant of the farm, with whom they were to board.

It might have appeared to an ordinary observer, cognizant of Mr. Stull's designs against the financial prosperity of Enoch Bullripple, that it was a rash and imprudent step for Stull, if he wished to remain unknown as the author of the intended injuries to the old farmer, to come into the neighborhood at the time when the injuries were about to be inflicted. But Mr. Stull had his wits about him. He had resolved that under no circumstances would he show in this affair, and when his working operations had been finally decided upon, he found that his occasional presence at Cherry Bridge would be a great aid in the preservation of his secret. This, therefore, was the principal reason for selecting this long-unvisited farm as a suitable place for his summer sojourn.

Mrs. Stull, whose tastes were rather domestic than otherwise, was very willing, after a winter of a somewhat goaded social activity, to retire into an uneventful country life; the two younger girls, both in short dresses, were delighted at the prospect of field rambles and mountain scrambles; and even Miss Matilda thought she might find a good deal to amuse and interest her independent and practical mind at Cherry Bridge.

During the first week of their stay on the farm Mr. Stull's family found their anticipations of pleasure fully realized; but towards the end of that period Miss Matilda was obliged to admit to herself that things were getting a little dull. She had taken all the drives she cared to take with her mother and sisters; she had taken all the walks she cared to take by herself, for her mother never walked, and the two girls always ran; and she began to see that nature had not designed her to be happy under any circumstances in which she had nobody to talk to.

It was in this mood that she sauntered one day across a broad pasture-field through which a narrow path meanderingly ran. With one small and tightly gloved hand she held a bright red parasol over her head, and with the other hand she raised the skirt of her fashionably modeled dress just enough to show her tightly fitting boots. To those who were acquainted with this small but very pretty young woman, everything about her seemed to partake of the characteristics of her gloves and boots. Even her ideas, although they were not very far-reaching, were admirably adapted and shaped to their objects.

Raising her eyes as she daintily trod the narrow path, she saw, approaching her, a young man of rotund and sturdy proportions, an upright carriage, and a strong, energetic, though rather rolling gait. His rounded cheeks were somewhat flushed, perhaps from exercise, and on his brow there was an air of gentle resignation, mingled now with some other feeling which might be embarrassment, uncertain anticipation, or some form of indeterminate anxiety. The moment the eyes of Miss Matilda fell upon this young man she recognized him by the resigned brow which she had frequently noticed while taking refreshments at Vatoldi's.

John had seen Miss Matilda long before she had noticed him. He was not altogether surprised at the vision of this being, who for many months had been so prominent in his thoughts; for he knew the family were coming to their farm, and it was very natural that Miss Matilda should give herself the pleasure of a walk abroad. His soul was rejoiced to look upon her again, but his ideas of propriety and exact social conduct were in a sad tremble. He did not know what he ought to do when he met her. Strictly speaking he was not acquainted with her, although some slight conversation had once taken place between them at the cashier's desk at Vatoldi's. It might be that she would not resent a bow from him, should she but remember that she had spoken with him, notwithstanding a collateral recollection of having very often paid him for her luncheons. Moreover the two were now in the country, upon a narrow path through a field, and under such circumstances it was certainly proper for a man to raise his hat when he passed a lady, no matter whether she recognized him or not. But, more powerful than these motives impelling him to bow to Miss Matilda, was the remembrance that he was now her father's partner. To be sure she did not know this, but he was very conscious of it, and this consciousness had already begun to have a stiffening effect upon his character. Miss Matilda might not deign even to look at him, but a rebuff of this kind would not have the effect upon him it would have had a few weeks before. "Therefore," said John to himself, "I will take off my hat as I pass her." And as this act, look upon it as he might, had in it a gentle flavor of acquaintanceship, it was quite natural his heart should flutter and his cheeks increase their healthful glow.

But, to the great surprise of the young man, Miss Stull stopped before he reached her, and stood, looking pleasantly at him as if she were awaiting his approach. This was indeed the case, for the heart of Miss Matilda was cheered

by the sight of a young man whose appearance was familiar to her, and to whom she had a very fair excuse for speaking.

"Good-morning," she said, when he was near enough.

John, his whole being thoroughly moved by this salutation, stopped, took off his hat, put it on again, ejaculated "Good-morning," and without any volition on his part was about to pass on. But Miss Matilda had no intention of allowing this.

"Are you not the gentleman who attended to the desk at Vatoldi's restaurant?" she said. "I have seen you there so often that I recognized you immediately, although it appears very odd to meet you out here in this far-away country place."

John indistinctly murmured something to the effect that it was rather odd.

"But now I come to think of it," she continued, "you once told me you were born here. In that case of course it isn't odd that you should sometimes come here."

The fact that she remembered the little conversation gave John such a rush of delight to the head that he was incapable of making an immediate remark suitable to the occasion, and stammered out instead some words which seemed to indicate that he thought it was rather odd that he should have been born here.

"Everything must seem very familiar to you," said Miss Matilda, "and things ought to be very familiar to me too, for I used to live here when I was a girl. But, somehow or other, they are not. These fields are not so large as I remember them, and the mountains and woods seem a great deal nearer than they used to be. I wonder if this is the field where that old gentleman who told me in the restaurant that he was your uncle used to keep a savage bull for the sole purpose, as I believed, of frightening children off the grass."

John's tumultuous emotion was now subsiding into an astonished delight at the friendly words and manner of Miss Stull. "Yes, ma'am," said he, "this is the field, but there is no bull here now."

"Oh, I am not in the slightest degree afraid of it," said Miss Matilda, "with some one here to drive him away."

John smiled and glowed, and, emboldened by his pleasure, made an independent remark. "You couldn't have been very much afraid of it, ma'am," he said, "when you came into the field with your red parasol."

"I did think of the bull," said Miss Matilda, twirling the parasol in front of her as she spoke, "and I thought if he should come at me it would be a very good thing to have this red parasol. I should have thrown it right down

in the way he was coming and then, while he was horning it, I should have run away."

"That would have been a tip-top thing to do," said John, admiringly. "I don't believe anybody could have done better than that."

"Except keep out of the field altogether," she said. "And now can you tell me which way I ought to go to find a path which will lead me to some place where I can get into the road that runs by my father's farm. You know where that is?"

"Oh, yes," said John, "that was the place I was born on. If you just walk across the grass to the fence corner over there, you will come to bars which can be let down, and then on the other side of the next field is a gate which opens into the road."

"How do you let down bars?" asked Miss Matilda.

"Oh, I'll go over and do it for you," said John.

Miss Matilda smiled and thanked him, and the two walked together over the grass to the fence corner.

"It seems strange," said Miss Stull, "that, being born on a farm, you did not stay there and become a farmer instead of going to the city and keeping a restaurant."

"I didn't have any choice in the matter," said John. And in his heart he thought that he was rejoiced that his mother's home had been snatched from her, and that he had been cast forth upon the world; for, otherwise, he would never have come in contact with the Stulls, and this enrapturing walk across the fields could never have been a reality.

"After all," continued the lady, "it isn't such a very bad arrangement, for I suppose your uncle can raise bulls here and send them down to be used in your restaurant."

John smiled vigorously. "Uncle does sometimes sell us things from the farm, but we never had any call for the kind of meat you speak of. All that we buy is the tenderest and best."

"That is very true," said Miss Matilda, "for I remember that I often used to get there the nicest kinds of lamb chops, and, sometimes, sweetbreads."

Had the heavens opened? Was it possible that the memory of those carefully reserved chops and sweetbreads still lingered in her soul? Could it be that they had made an impression thereon? Dared he to believe that she saw in these delicacies something more than the lamb or the calf could offer? Be the truth what it might, it was enough now to know that she remembered those choice bits which he had so carefully preserved for her in the corner of his ice-box, and which represented the feelings that filled, not a corner, but the whole of his heart.

"If ever again," he said to himself, as he strode proudly beside her, "she doesn't come for two or three days, and any of those cuts are left over, no soul on earth shall eat them but myself!"

The bars were taken down with great alacrity. Then John offered to accompany the lady to the gate, for, as he remarked, it was more than likely that it was fastened up in some way that would make it hard for her to open it. Miss Stull had no desire to lose John's company at that point, and, accepting his offer, the two continued their walk.

When they had passed through a gate, which really did require the hand of a man to open it, John said, pointing to a farm-house which stood some little distance back from the road: "That is the house of my uncle, Mr. Bullripple. My mother lives with him, and I am spending my holiday there. Wouldn't you like to step in and rest? My mother will be very glad to see you, and it is a good mile to your father's farm along this road."

Miss Matilda hesitated a moment. "Do you think your mother could give me a glass of milk?" she said.

"Milk!" exclaimed John, "gallons of it! Rich as cream, and right out of the cool spring-house."

"That sounds nice," said Miss Matilda, "although I don't want gallons. I think I will stop and rest."

With more of a roll, and more of a swell, and more of a vigorous step than he had ever shown before, John crossed the road and threw open the Bullripple gate. Up the short lane shaded by cherry-trees he proudly escorted Miss Stull. The young lady declared she did not care to go into the house, but would rather rest in the shade outside, so John led her to a chair under the great oak-tree where stood the table at which Mr. Stratford frequently wrote his letters.

"I will tell mother you are here," said John, "and you shall have some milk in a moment."

When Mrs. People heard who was sitting under the tree, she knitted her brows. Her opinion of Mr. Stull was one of the strongest reprobation, and, years ago, had been personally stated to him. She had never changed this opinion, nor did she know of any reason why she should like anything belonging to him. If his daughter stopped in her yard and asked for a drink of milk she would give it to her just as she would give it to a needy tramp, but she did not want to go out and see her. Besides she was busy in the kitchen, and was not in a condition to see folks.

"Mother," said John, "I'll go to the spring-house and get a pitcher of milk, and will you

please put some of those big raspberries that were picked to-day into something, and I will take them out to her."

The chin of Mrs. People went up into the air, and she made no answer. She was not accustomed to refuse any request made by her dear boy, but this was going very far. Why should John put himself to so much trouble to refresh old Stull's daughter? She stepped to a window of the kitchen which was in the end of the house and commanded a view of the oak-tree. That girl out there was certainly very pretty, and wore as stylish clothes as ever had been seen in this part of the country. Mrs. People did not affect such things herself, but she knew them when she saw them.

As she stood and gazed on Miss Matilda, a brilliant idea flashed into Mrs. People's mind. "Suppose," she thought, "just suppose that should happen!" and she rubbed together her floury hands. She knew that Miss Stull, as well as her father, frequently came to Vatoldi's, and she supposed it was there John had made the young lady's acquaintance, and nothing could be more natural than that they should like each other. She was truly a pretty little piece of goods; and as for John, a manlier figure and an honester face were never created for the delight of womankind. Yes, indeed, if that should come about, the family would get back more than they had lost; and if old Stull didn't like it, he could lump it. And to know that he lumped it would be a rare joy to Mrs. People.

Quickly now the good woman washed her hands. A handsome glass dish was heaped with bright red raspberries, several slices of her nicest cake were put upon a pretty china plate, a bowl of white sugar was brought out, and when John appeared with the milk she sent him back for a pitcher of cream. And while he was gone she glanced along her pantry shelves, and added some guava jelly to the other refreshments. When John came, he covered a waiter with a large napkin, and with much celerity arranged upon it the articles mentioned, together with the necessary spoons, saucers, napkin, and tumbler, and a glass of water. Throwing a small table-cloth over his left arm John took up the waiter, and stepped briskly into the yard; his mother assuring him that she would go out and speak to the young lady as soon as she had put on something fit to be seen.

Arrived at the tree, the waiter was daintily placed upon the grass, the cloth was swiftly but correctly spread upon the table, and then, with the skill of the head-man at Vatoldi's, John placed dishes, glasses, pitchers, and saucers upon the fine white cloth.

"Goodness gracious!" exclaimed Miss Stull,

when John appeared. "You've brought me a regular meal! But I must say this seems quite natural! Why, I could almost imagine myself at Vatoldi's, and you, or one of your waiters, fixing up everything in such a tempting way!"

And Miss Matilda, not at all loath to enjoy what was set before her, drew off her gloves, and began her repast; while John poured out the milk, served the berries, handed the cream and sugar, proffered the cake, and performed every service with the grace and foresight of an accomplished knight of the restaurant.

Now appeared, at the front door of the house, Mr. Stratford prepared for an afternoon drive. Somewhat surprised at the scene under the oak-tree, he stood and gazed at it with considerable interest. "Are the business instincts of that young man so strong," he thought, "that he has started a restaurant in the yard? He has certainly a very nice-looking customer."

It was plain to a man of observation that John's attentions to the lady who was refreshing herself were much more assiduous than those paid by the ordinary waiter; and Stratford smiled as he noticed the alacrity and readiness with which the young man anticipated and provided for the desires of the lady.

Having put on his gloves, Mr. Stratford walked across an opposite corner of the yard toward a hitching-post where his horse and buggy awaited him. Miss Stull now first noticed him, and immediately inquired of John who was that gentleman. John gave her the necessary information, and, while expressing her surprise that a gentleman like that should be willing to shut himself up here in a farmhouse, she watched Mr. Stratford as he prepared to drive away. She admired his straight and well-proportioned figure; she appreciated to the full the correct and handsome fashion of the clothes he wore; and although his face was somewhat embrowned, it met with her entire approval. Instantly she began to think that this neighborhood, which that morning had seemed to her so dull, might yet prove quite interesting.

Stratford drove away, and almost immediately afterward Mrs. People appeared under the oak-tree, attired in a pink and white striped frock, very much washed and starched. She offered Miss Stull a very friendly greeting which that young lady received with suitable moderation. John placed a chair for his mother, and, the repast having been concluded, he carried away the dishes, the table-cloth, and napkin.

"I'm very much obliged to you for your milk," said Miss Matilda, "and the berries were really delicious." She said nothing about the cake, which Mrs. People had made herself,

and praise of which she anxiously awaited, but proceeded to ask Mrs. People if there were many persons from the cities now staying in this part of the country.

"No," said Mrs. People, generously refraining from any hints in regard to the quality of the cake. "There's Mr. Stratford, who, perhaps, you noticed just goin' away in his buggy. He's been spendin' the summers with us for a good many years, and no President of the United States ever came near him for bein' an out and out gentleman from his hat to his boots. He's goin' now to see Mrs. Justin, who lives about three miles from here, and she might, perhaps, be called city folks too, because she has a house in town, although this one is her real home, bein' where her husband died, and where she comes every year just as certain as the Spring lambs. Besides these, there's no city folks except a gentleman who comes every Saturday to Mrs. Justin's to see a young lady who is stayin' there, who is just about as pretty as any pictur' that ever was painted, though John has said to me two or three times, and when I first heard him speak of it I could n't for the life of me think why he made such a p'int of her looks, that she's not the kind of a girl he fancies, there bein' somethin' too much of her, and an air about her which he calls 'too larky,' havin' seen her once or twice walkin' over the fields, and goin' along in a way which I suppose reminded him of a lark bird; and says he to me: 'Mother,' and I declare I didn't understand what he meant when he first said it—'Mother,' said he, 'the kind of a girl I fancy is more like a wren'; one of these Jenny wrens, ma'am, that build in a box. You don't see 'em in the city, perhaps, but there's plenty of 'em here. And John says he fancies a girl that's more like them, bein' littler than a lark, and more natty and smarter; an' I am sure no one would ever be offended if they could once see a wren settin' on the top of her box, just as neat as a new pin, and always there when wanted, at least I suppose so, though never havin' wanted a wren I can't say for certain, though I know very well that a lark is a different kind of a bird, and not to be depended upon."

About larks and wrens Miss Stull cared nothing at all, and she perceived none of the delicate allusions in Mrs. People's remarks. But she took great interest in Mrs. Justin, and asked many questions about her. The Justins had always kept aloof from the Stulls, and Miss Matilda had never heard the name mentioned. Now, however, she determined that she would make it a point to become acquainted with Mrs. Justin. If the neighborhood was to be made interesting she must know her neighbors.

Miss Matilda soon took her leave, and although John offered to walk with her as far as her father's farm, she declined his services. The road would lead her directly home, she said, and there was ever so much of the afternoon left.

Mrs. People and John accompanied their visitor to the gate, and as she went out she turned to the latter and said with a smile: "If I thought there was any chance of meeting a bull in the road perhaps I might let you go with me."

If John had read her expression he would have seen that it indicated a desire not to drop wholly the acquaintance of one who might yet be useful to her. But he could find no immediate answer to this remark, and merely allowed himself a melancholy smile. But his mother did not hesitate an instant.

"Now, Miss Stull," said she, "just let me tell you this. Old Mr. Barclay, who lives, himself, down at the Bridge, has got a field just at the turn of the road there, where he most commonly pastur's some cattle, and sometimes he does have a bull among 'em, which it may be cross and it may be not, which is not for you nor me to say, Miss Stull, not havin' seen him. And though Mr. Barclay always does keep up his fences, like a good neighbor as he is, he hasn't been along this way for more'n a week—yes, I guess it's a good two weeks—and I've found out in the course of my life that no farm hand is to be depended on in the matter of top rails bein' up, like the master himself. And now, you see, Miss Stull, if there is a bull in that field, and he happens to be a cross one, and some of the top rails has been knocked down, or been left not put up, and none of us not knowin' can say that none of them things isn't, why then it would be a great sight safer, Miss Stull, for you to let my son John walk along with you as far as your father's gate."

Miss Matilda laughed. "Thank you," she said, "but I think I'll take the chances." And she walked briskly away.

XVI.

As Mr. Stratford rode away from the Bull-ripple farm, his mind was somewhat occupied by conjectures regarding the young lady who was being served with refreshments under the great oak-tree. He began to fear that Mrs. People had been induced to take other boarders, and this would be in violation of the verbal contract he had made with her. The notion of it troubled him, especially as nothing had been previously said about it, and this would imply a total change in the frank and communicative manner of his landlady.

Resolving to inquire into the matter as soon as he returned to the farm, he put it all behind him long before he arrived at Mrs. Justin's house.

The lady of the mansion was on the piazza, and she was very glad to see him. A return to the friendly intercourse of so many years was delightful to her true soul, as loyal to her friends as to her memories. But her reception of Stratford, warm and cordial as it was, appeared tame and lukewarm when compared to the greeting given him by Gay when that young lady came flying downstairs and out of the front door to meet him. She ran to him with glowing cheeks and sparkling eyes and both hands outstretched.

As she looked on at this meeting the spirits of Mrs. Justin fell a degree or two, and her faith in Gay's unalterable devotion to Mr. Crisman wavered for a moment. Never had she seen that young lady so glad to meet her lover. But quickly the assuring reflection came to her that lovers do not show their true feeling before other people, and that Gay's joy at having Mr. Crisman with her was probably shown to him alone. This was all open and free for anybody to see, and meant nothing but that Gay was delighted to meet again this kind friend and teacher. If the girl had suspected for a moment what Stratford had thought about her and Mr. Crisman there would have been no such greeting as this. So the free-hearted openness of Gay's manner to her friend proved the strength of her love for her lover, and the spirits of Mrs. Justin rose to their previous level.

"And now you must tell us," said Gay, "why you have staid away so long. It was awfully kind of you to take Mr. Crisman fishing. He says he hasn't had such a good day for ever so long. Everything would have been simply perfect if you had come back with him to dinner, and we all could have talked over the day's adventures."

At this Stratford smiled, but a touch of pity came into his heart when he thought of what a bad day he might make of that good one of which the young man had spoken so cheerily. But all sentiment of this kind quickly vanished as he looked at Gay and thought of Crisman.

Mr. Stratford would not stay to dinner, but he promised to come and dine on the morrow, when Mr. Crisman would be there. Mrs. Justin and Gay walked with him to his vehicle, and the young girl broke into strong admiration of the horse. Without a thought of anything more than she said, she declared that it must be absolutely delightful to ride behind such an animal as that.

"Wouldn't you like to test it?" said Strat-

ford. "There's plenty of time for a drive of a mile or two."

Gay, with her face full of the most ardent consent, looked at Mrs. Justin, while Stratford remarked that he was sorry that the character of his vehicle did not permit him to ask them both.

Mrs. Justin hesitated, but quickly concluded that any disapprobation of the drive, such a commonplace thing in itself, would show to Stratford that she did not believe what she had written to him in her letter. So she stiffened her mind with the thought of Gay's fidelity, and she said: "Why not take her a little drive? And some other time you must show me the quality of your horse."

"Do you always drive as fast as this?" exclaimed Gay, when they were on the public road. "What a magnificent horse! His hind legs work like a steam-engine! It's perfectly splendid to see him let himself down with the skin wrinkling on his back, and his ears up. Why, this is going like the wind!"

"I seldom drive so fast," said Stratford, "but I thought you would like a short spurt of speed, and as we have but little time I want to get you up to the Summit as soon as possible. There will be a fine view from there this evening."

"You can't go too fast for me," said Gay, "and I wish the Summit were twelve miles away instead of two.—What! There already!" she exclaimed presently, when they reached a spot where the road began to dip into the valley beneath. "Why, Mr. Stratford, it's a long, long walk!"

"And a short, short spin on wheels," he replied. "And now, look out there! Isn't that worth coming to see?"

Gay had looked upon this view before, but never at this hour. They were on a different side of the ridge from which, sitting on a rail fence, they had once viewed the sunset; and a far wider extent of country was spread out before them. The opening glories of the western sky were at their backs, but beneath them stretched a far-reaching plain, green here with pastures, yellow there with ripening grain, and these brighter colors relieved by great masses of thick forest which seemed to be retiring in irregular columns towards a distant line of mountains which raised themselves, clear and blue, along the horizon. The great, white clouds which floated in the sky were tinged with a delicate pink by the reflections from the west, and over everything there fell the veil of evening, which at this hour softened, without obscuring, the scene.

"This is altogether new," said Gay, her hand unconsciously resting on her companion's sleeve. "I have never seen it like this."

She said little, but her eyes were feasting; and Stratford sat and looked at her. Presently he got down and opened a gate by the side of the road, and then mounting again to his seat he drove into a field and along a narrow way between rows of corn towards a grassy acclivity which stood higher than the place at which they had first stopped.

"Where are you going?" asked Gay.

"To get a view from a different point," was the answer. "I think you will like it."

She did like it. She actually rose to her feet with a cry of delight. Not far away, and amid the soft beauty of the evening landscape, lay a small and almost luminous sheet of water, shining like a diamond in a rich, dark setting of green banks and overhanging pines.

"A lake!" cried Gay. "A lovely little lake! I never knew there was such a thing in all this country!"

"It is not a lake," said Stratford. "It is nothing but our little Cherry Creek, which makes a broad bend beneath that bank, and shows no more of itself from this point, either coming or going; but it gives a master's touch to the scene; don't you think so?"

"It makes it perfect," said Gay. "Simply perfect."

As she gazed, there came into the mind of Gay something she was about to say, but she checked herself. She remembered that the most beautiful and peculiar views she had seen in this neighborhood had been shown to her by Mr. Stratford. She was about to express her gratitude in words which should show her appreciation of this fact, but there came into her mind another recollection with which some feelings of regret were mingled. She determined, on the spot, that one of the things which it was her duty to do for Mr. Crisman was to induce him to appreciate the loveliness which nature has to show us in a country like this. He not only ought to like them for himself, but he ought to like to see her enjoy them. Of course this could not be expected just now, because, as he had often told her, it did not matter to him where they walked or what he saw, so that she was with him. It was delightful to have Charlie think in this way of her, but she wanted him to love hills and valleys and distant mountains and beautiful skies as much as she did. She intended to lead his mind into a true regard for these things, and she knew she could do it.

As they were returning on the high road, going more slowly than when they came, Gay looked at the horse and then at the reins in Mr. Stratford's hands, and then she looked at him, and plucked up courage to ask, in hesitating words, if he would let her drive a little.

"Of course," said Stratford, handing the reins to her; "do you like driving?"

"I have scarcely ever tried it," exclaimed Gay, "but I know I should like it above all things. I used to ride sometimes with the other girls when I was at college, but I believe I should like driving better."

"It depends upon the horse and the country you are in," replied Stratford. "You must draw the reins a little tighter. Let me show you how to hold them."

Gay's ideas of driving were exceedingly crude, but she was a girl of quick observation, and her little hands grasped the reins in exactly the manner which Mr. Stratford, by word or touch, now indicated. The horse gave his head an approving nod or two as he felt the tightening pressure on his bit, and stepped out well, and the spirit and the life of him seemed to come through the long leathern lines into Gay's hands, and her face was flushed with a new-born pleasure.

"I feel," she cried, as they rolled along, "exactly as if I were doing it all myself."

Stratford laughed, and showed her how to do it better, warning her in good time, before she reached them, of awkward ruts or obtruding stones. Some of these she hit and some she missed, but within her glowed and sparkled the pleasure of the driving, until, with a wholly unnecessary "Whoa!" she drew up at Mrs. Justin's gate.

"I ought to be ashamed to admit it," she exclaimed when, her hands in those of Stratford, she had sprung to the ground, "but I really believe that driving your horse was a greater delight than looking at those lovely views. That oughtn't to be, but it is."

The next day Mr. Stratford came to Mrs. Justin's house to dinner, and his hostess found herself doing something which she had never done before. She was watching her guests, particularly Mr. Crisman. She was curious to know what he would think, if Gay should be as glad to see Mr. Stratford as she had been the day before. There was no reason to expect such strong demonstrations of delight, and none such occurred; but there was a show of hearty good-fellowship, as Stratford and the young lady shook each other by the hand, which produced an impression upon Mr. Crisman. It was plain to Mrs. Justin that he was surprised to see it.

In her observations of Stratford the lady of the house hoped to perceive that what she had said in her letter had had its due effect upon him, and although he might not be willing to acknowledge that he had made a mistake, he would show by his conduct — and Mrs. Justin felt quite able to read her friend's convictions through his conduct — that he had

abandoned the mad plan he had proposed to himself.

But she saw no evidence of any such determination. In fact, Mr. Stratford's conduct gave her more concern than it had ever done before. On previous occasions, when he and Crisman had been together at her house, Stratford had been very careful not to obtrude himself upon the lovers, acting in unison with his hostess to give them every opportunity of enjoying undisturbed the society of each other. But now he seemed to treat Gay as a young lady to whom the conversation of one man was as pleasant as that of another. There was no attempt to interfere with Mr. Crisman's efforts to make himself agreeable to Gay; but, on the other hand, there was no attempt to offer him facilities for doing so. The conversation, therefore, continued to be a general one, even for some time after dinner. The talk turning upon foreign cities, a subject in which Gay was greatly interested, Stratford opened a portfolio of photographs collected by Mrs. Justin in an Italian tour, and began to show to Gay some of the places they had been talking about.

The soul of the young lady was soon completely absorbed in traveling from temple to palace, from olive grove to crumbling ruin, in company with one who had seen them all, and who made her feel as if she were really seeing them herself. While this was going on Mrs. Justin and Crisman continued to converse; but the young man soon became impatient, and, rising, began to walk up and down the room, regarding the couple at the portfolio with evident disapprobation.

The two had come up from Naples, had wandered through portions of Rome, and were in the court-yard of the Palazzo Vecchio in Florence, when the mind of Gay became troubled. She was greatly enjoying herself, but there seemed to be something wanting; and, looking up, she asked Mr. Crisman if he did not wish to come and look at these photographs and have Mr. Stratford tell him all about them.

"Thank you kindly," said Crisman, "but I don't care for photographs. If I can't see the real thing I'm perfectly willing to let it all go by."

Gay made no answer, but her countenance became a little troubled, and she began to rapidly turn the photographs, merely asking a question here and there. Stratford quickly noticed her mood, and the tour by photography was soon brought quietly to an end, as if they had both grown a little tired of it. Crisman had now gone out on the piazza to see what sort of night it was. Gay followed him to assist him in making his observations,

and Stratford saw no more of the two that evening.

Mrs. Justin felt a little provoked with her friend, and somewhat inclined to scold him, and yet, she said to herself, why should she do so? After asking him to come to her house and be the same friend he had been before, should she now begin to find fault with him for his civilities to her other friends? There was really no occasion to reprove him, and she did not, but she continued to feel dissatisfied with him, all the same. When he took his leave he perceived a little of that dissatisfaction in her manner, but he resolutely took no notice of it. He had decided that enough had been said between him and Mrs. Justin on the subject of Gay and her lover, and his purpose regarding them; and, so far as it lay in his power, he would avoid saying anything more.

The next morning at breakfast Mr. Crisman allowed himself to make some remarks which were decidedly uncomplimentary to Mr. Stratford. He made no attack upon that gentleman, but he delivered himself of some general opinions which were evidently intended to include Mr. Stratford in their application. The tone and purpose of these remarks were very displeasing to Mrs. Justin. It was not unnatural, although she believed it to be without sufficient reason, that Mr. Crisman should feel somewhat annoyed that a man should engross for a time the attention of his lady love, but there was no reason whatever why Mr. Stratford should be so spoken of in the house of his friend. Mrs. Justin's eyes flashed a little, and she was on the point of making a sharp reply, but remembering that Crisman was also her guest, she restrained herself, and found a quick occasion to change the conversation. Gay said nothing, but it was easy enough to see that she understood the full purport of Crisman's words. She would have been glad to burst out with a vehement assertion that if Mr. Crisman intended to include Mr. Stratford among the people he was talking about, he had made a great mistake. But her woman's sense taught her that it would be unwise in her to undertake the defense of Stratford against her lover. She felt it was cowardly to remain silent, but she did so, hoping however, most earnestly, that Mrs. Justin would speak.

Mrs. Justin did speak. Crisman would not allow the conversation to remain changed, and made another unpleasant allusion to Stratford, more pointed than anything he had said before. This was too much for the hostess to endure, even from a guest, and in a few words, a little more prompt in delivery than she intended them to be, she assured Mr. Crisman that she knew many persons who were

extremely willing to impart their information, and very quick to see where such information would be of advantage, but who were neither vain of their knowledge, nor used it as a means of insolently showing their superiority to other people. As an instance of such persons she mentioned Mr. Stratford.

Gay was delighted with this reply, and looked her thanks to Mrs. Justin. The latter noticed them, but received them with slight satisfaction. She was defending her friend for her own sake, not for Gay's.

Crisman smiled. His shot had hit, and the hit had been acknowledged. He was satisfied, and, after remarking that it was all right to stand up for one's friends and that he did not intend to pitch into anybody, he changed the conversation of his own accord, and bore during the rest of the meal the greater part of it himself.

All that afternoon Mr. Stratford was expected by Mrs. Justin and Gay. They hoped he would come, not only because they were always glad to see him, but because they felt that, in a manner, he owed it to himself not to keep in the background when his character had been assailed. To be sure he did not know that anything had been said against him, but Mrs. Justin and Gay knew it, and that was sufficient reason for them to think he should come forward and show himself. But, on the other hand, they both feared his coming. For every reason they greatly desired peace, and they had some cause to suppose that if Mr. Crisman and Stratford were in the house together that day there might not be peace. This was a very unpleasant thought to think; and Gay, on her part, assured herself that there was not the least reason in the world for thinking it; and yet, being a young person with a sensitiveness of perception which she was not yet capable of appreciating, she thought it, all the same. As for Mr. Crisman, he intended, if that very superior gentleman from the Bullripple farm made his appearance at Mrs. Justin's house that day, to give him a cold shoulder, and, if necessary, a sharp elbow. But Mr. Stratford did not come, and although the day proved to be rather a dull one, it was a very placid one.

That afternoon Mr. Stratford took a walk by himself over the fields and hills. He had

intended going to Mrs. Justin's, but he, too, had quick perceptions, and, while he had no idea of relinquishing his purposes, he would not intentionally do anything that might disturb the harmony of Mrs. Justin's home, and he had believed when on the evening before he had seen Crisman walking restlessly up and down the room, that harmony might easily be disturbed.

Over the fields, that afternoon, also, walked Miss Matilda Stull. When she saw from afar a gentleman crossing the same field she recognized immediately that this was the Mr. Stratford who lived at the Bullripple farm. Then said Miss Matilda to herself, "how I do wish that he had lived here when I was a little girl playing about these fields; that his uncle had owned a wicked bull; and that I knew him well enough to stop and talk about it. Of course I don't wish that I had met him at a restaurant where I paid him money for my luncheon, but it would be ever so nice if I had made his acquaintance at some suitable place, and could now stop and talk to him about old times. And if he would walk with me, and show me the way, and let down the bars for me—that would be another sort of thing altogether!"

As Mr. Stratford passed, he raised his hat, and Miss Stull slightly bowed. She knew that when gentlemen and ladies met each other in these out-of-the-way places it was quite proper that they should recognize each other's presence. And now Miss Stull walked on with a quick step. It was only the afternoon before that, standing in a little shop, she had seen Mrs. Justin and Gay drive through the village on their way to the station where they were going to meet Mr. Crisman. And now she had encountered face to face that gentleman who had excited her interest when refreshing herself under the Bullripple oak.

"It is perfectly ridiculous," she said to herself, "that all these people should be in this neighborhood, and I not know them. None of them have called, but I suppose they haven't the slightest idea we are here. Mother don't want to know anybody, and is glad to shut herself up. If father were here it would be different; but I'm not going to wait for him. They've got to call on us, and I shall make it my business to see that they do it."

(To be continued.)

Frank R. Stockton.

SOME PORTRAITS OF HAWTHORNE.

HE portraits of men who have proved their greatness in literature, art, statecraft, religion, warfare, or in some other field of human action, naturally become subjects of public interest. It has happened

recently that in several quarters attention has been directed to portraits of Nathaniel Hawthorne; and some valuable discoveries have been made. Owing to these discoveries, however, more or less confusion has arisen concerning the portraits newly found. In the paragraphs which follow, I shall attempt to dispel this confusion and to record facts in such a way that collectors, or future investigators, may have something accurate to go by. But it may be well to premise that my remarks are not to be read as if they formed what is called a literary essay. The nature of the case compels a simple effort to unravel a certain tangle of facts and inferences; and that unraveling is all that I shall attempt. It will be necessary for me to talk about coats, waistcoats, and cravats; but if it should seem to readers amusing that I do so, because I wish to be accurate and make my meaning clear, that is a matter of little moment to me.

A short time before I wrote the Introductory Notes for a new edition of Hawthorne's Works,* I received a letter from Mr. George H. Holden, of Providence, which referred to Hawthorne. This resulted in a correspondence and acquaintance. Mr. Holden took a great interest in the various existing portraits of Hawthorne, and especially the original photographs of him. In the "Biographical Sketch" that I attached to the Riverside edition, I made mention of several representations of Hawthorne with which I was familiar.

One of these was a photograph taken in England, formerly owned by Nathaniel Hawthorne's wife and now, as for some years past, in the possession of her daughter, Mrs. Lathrop. This photograph, Miss E. P. Peabody (Mrs. Hawthorne's sister) had frequently told me, was made for John Lothrop Motley. Her belief in this regard, founded apparently upon something which Mr. Motley had told her, was that the historian, wishing to have a graphic likeness of his friend, which should be

taken without premeditation, surprised Hawthorne into being photographed unawares. Accordingly, I detailed the supposed authentic incident in my Biographical Sketch,† as follows:

"His friend, John Lothrop Motley, induced him one day to enter a photographer's establishment, on the plea that he had business of his own there. Hawthorne was given a book to read, while waiting, and when the photographer was ready Motley attracted his friend's attention. Hawthorne looked up with a dawning smile, a bright, expectant glance — holding the book on his knee meanwhile, with a finger in the place, — and instantly a perfect negative was made."

This was the way in which the story had been many times related to me, on what I supposed to be the best authority; and it was natural, therefore, that it should have been repeated, among others, to Mr. Holden, who I believe further questioned Miss Peabody about it, and then published the supposed facts in a letter to the "Salem Gazette." His version, however, introduced some particulars which I did not remember to have heard before; viz., that Motley's excuse for going into the photograph gallery was to examine some proofs of a likeness of himself, and that Hawthorne was photographed while looking after Motley just as the latter was disappearing behind a screen, ostensibly in search of the proofs. Mr. Holden also said that, although Hawthorne remained ignorant of the "surreptitious picture," one of his children saw it, and mentioned it to her father after they had left England. But Hawthorne was incredulous, and fancied that his daughter was mistaken. "After her husband's death," Mr. Holden went on, "Mrs. Hawthorne became acquainted with the facts as above narrated, and at her earnest entreaty the photograph was sent to her."

The anecdote thus put forward in print for the first time — it was published in the "Gazette" before my Biographical Sketch came out — was pronounced by Mr. Julian Hawthorne "a real curiosity in fabrication";‡ and he proceeded to give an extract from a letter written to him by Henry A. Bright, of Liverpool, one of Nathaniel Hawthorne's intimate friends in England. According to Mr. Bright's letter:

"The account of the photograph being taken for Mr. Motley is quite wrong. I went with Hawthorne

‡ Vol. II., p. 257, "Nathaniel Hawthorne and his Wife: a Biography."

to the photographer (Mayall), as he had promised me a photograph of himself. He gave his name, and Mayall came up in a great state of excitement. Hawthorne got very shy, and grasped his umbrella as if it were the last friend left him. This, of course, was taken away from him by the photographer, and a table with a book on it was put in its place. 'Now, sir!' said Mayall, 'please to look *intense!*' He was afterwards told to look smiling (at the portrait of a lady!) I chose the intense one, and afterwards had a copy of it taken for a friend of Hawthorne. I am amused to find (in the current anecdote) that Mr. Motley attracted Hawthorne's attention 'at the critical moment.' This is quite imaginative; for Mayall insisted on my going behind a screen, where your father could not see me. After your father's death the photograph was engraved, and I sent other copies to your mother, Mr. Longfellow, and one or two more. The original (there was only one taken at the time) hangs in my own room."

It would appear, from Mr. Bright's statement, that only one photograph was made in England; and that that one was made for him, under his personal care. Mr. Julian Hawthorne has also published a note sent by Mr. Bright to Nathaniel Hawthorne, dated Thursday, May 18, 1860, which contains the following:

"MY DEAR MR. HAWTHORNE: *If* to-morrow is sunshiny enough to photograph you, and *if* you are not otherwise engaged, well, let us get it done! I shall be here (Oxford and Cambridge Club) at twelve, and again at four, if you will look in at either time. . . . I was very glad indeed to see Mr. Motley last night."

The prime value of this evidence is that it fixes the day on which a photograph of Hawthorne was taken for Bright. The day was May 19th, 1860; and Bright's letter to Julian Hawthorne shows that the photograph was the work of Mayall, a photographer then well known in London. The note also incidentally mentions Mr. Motley as being in town. These points must be borne in mind.

Mr. Holden did not rest content with the assurance that the traditional story was a fabrication. He believed in the tradition so far as to set on foot an inquiry. This resulted in his obtaining from Mayall (who is still living) a copy of a photograph of Nathaniel Hawthorne, hitherto unknown to the surviving members of the romancer's family. An interesting circumstance connected with this newly found photograph (an engraving from which was issued as the frontispiece of "Harper's Monthly" for July, 1886) is that—according to Mayall's entry-books—it was taken on May 19, 1860. Now that is the precise date at which Mr. Bright's Hawthorne photograph was made. But the "cabinet size" copy after which the enlarged "Harper" engraving was cut is now before me; it is the copy which Mr. Holden procured from Mayall; and on the back of it appear, in the writing of Mayall's son, these words taken from the original entry-book:

"Photo. of Nathaniel Hawthorne, May 19, 1860, for Mr. Motley, 31 Hertford St., Mayfair, London."

The pose and expression in this photograph, however, are materially different from those of the picture in Mrs. Lathrop's possession, which for a number of years had passed unchallenged as the Motley photograph. Here, then, we encounter a puzzle, the solution of which might at first seem impossible. Mrs. Lathrop's supposed "Lothrop Motley" photograph represents Hawthorne seated in a chair of peculiar shape, with a vacant space on each side. In his right hand he holds a book, with a finger between the leaves; and the book rests upon his left knee, which is crossed above his other knee. The face looks to the left, with a slightly upward glance and the intimation of a smile. A copy of this was used by Schoff in his etching of the head alone, for the second volume of "Nathaniel Hawthorne and his Wife" (p. 150); and the head, with the half-figure, has been reproduced by various photographers, who have sold great numbers of impressions. I do not know how they first obtained their plates for these reproductions. The Mayall picture, engraved for "Harper's Monthly," shows Hawthorne seated beside a table, only the edge of which is visible, with one arm lying easily upon a couple of books. The hand is not disclosed beyond the wrist; but the leaves of the upper book are slightly parted in the middle of the volume, as if a finger had been inserted there, after the manner of Mrs. Lathrop's photograph. The face, however, is turned towards the right, instead of the left; the chin is not lifted, but is depressed; and the eyes do not look upward. They are absorbed in a dreamy, meditative gaze which centers upon some point a little below their level. The right eyebrow, too, is very decidedly raised,—a characteristic peculiarity which is not exhibited in any other portrait of Hawthorne. The difference between these two pictures is, indeed, so striking that they are immediately recognizable as having been printed from two distinct negatives. But it is important to observe that the size of the head in both is the same, and that the coat, waistcoat, broad black cravat, and shirt-collar are the same. The waistcoat, curiously enough, becomes an important *pièce justificative*; the coat is a frock—or what would now be called a "Prince Albert"—of broadcloth, thrown loosely back and exposing the waistcoat, which is made of ribbed material. The texture of this waistcoat is plainly distinguishable in both of the photographs. Briefly, all the external adjuncts—the costume, and the book held with a finger between the leaves—go to prove that the two negatives were made on the

same day. The difference consists only in the fact that the pose is varied and that Mrs. Lathrop's picture gives us Hawthorne sitting in a chair, isolated, while the original of the "Harper" engraving places him at a table.

We must now go back to the fact that Mr. Bright speaks of *two* negatives having been made on May 19th, 1860,—one of them "intense," and the other "smiling." He chose the "intense" one, and says that he afterwards sent a copy to Mrs. Hawthorne. This copy is the one which Mrs. Lathrop now owns; but it is not "intense": on the contrary, it is smiling. The question thus arises, Was the portrait which has been published in "Harper's Monthly" the "intense" picture that Mr. Bright preferred, of the two which were produced under his supervision? We might decide that it was, but for two facts: (1) The "Harper" picture comes from Mayall, unequivocally, as having been made for Mr. Motley. (2) A third English photograph—with the same costume, with one hand lying on a book upon a table, and the eyes looking straight forward (the face almost full)—has been brought to light within a few months. We have, therefore, got three pictures to deal with, instead of two; and it is evident that Mr. Bright either did not know that one of them existed, or else had forgotten all about it.

The third photograph, to which I here allude, is for the first time placed before the public in this number of *THE CENTURY*. Its history is worth detailing. Francis Bennoch, another English friend of Hawthorne's,—a wealthy manufacturer, member of Parliament, and amateur author, who figures frequently in the "English Note-Books" and is still active in British politics,—had long cherished a photographic portrait of Hawthorne, made in 1860, and presented to him by the romancer, which he esteemed the best one extant. Mr. Holden, in the course of his inquiries, heard of this, and wrote to Mr. Bennoch; whereupon he received the particulars which are here to be set down. Some six years ago, or a little more, Mr. Bennoch sat for his portrait to one Piercy of Pall Mall, East, London, who rejoiced in a special and profitable process of portraiture which he had invented. Piercy then expressed a desire to utilize Bennoch's Hawthorne photograph for reproduction by his process, and Bennoch lent it to him. The matter escaped his mind for a year or two, when suddenly he became aware that the photograph had not been returned. Finally, recalling that it had been left with Piercy, he went to the latter's studio in search of it. Piercy declared that Mr. Julian Hawthorne, who had been living in London and had several times visited the studio to inspect the

progress of the work, had carried away the original photograph, promising to convey it to Mr. Bennoch. Bennoch was at a loss to account for his not having received it, and Mr. Julian Hawthorne, by that time, had left England and returned to the United States. Piercy held stoutly to his assertion; but when Bennoch renewed his inquiries, later, in 1886, a son of Piercy happened to be present and listened to the conversation. He asked about the size of the photograph, the style of frame, etc., and at last, without a word, stepped out of the room, coming back presently with the identical Bennoch-Hawthorne photograph in his hands. It was covered with dust; the glass was shattered by innumerable radiations. The photograph had been laid aside and forgotten; Mr. Julian Hawthorne had never had it in charge at all; Piercy was mistaken in his assertion on this point. But for Bennoch's persistence, prompted by Mr. Holden's questions, the picture might have been lost altogether. As events have turned out, it comes to us just in time to clear up the mystery enveloping the Bright and the Lothrop-Motley photographs.

How did these three photographs originate? The third one became the property of Mr. Bennoch, and until recently remained unknown to Hawthorne's family. Of the other two, which one was made for Motley; which for Mr. Bright? These are the essential questions.

Mr. Holden still maintains* that the picture published in "Harper's" is from the Bright photograph, and that Mrs. Lathrop's photograph is the one which was taken for John Lothrop Motley. Several items of evidence go against this theory. Mrs. Lathrop's photograph has no imprint; so that we do not know positively from whose atelier it came. Bright, also, in his letter to Mr. Julian Hawthorne, states that Nathaniel Hawthorne was posed beside a table on which was laid a book. Now in Mrs. Lathrop's photograph no fragment of a table, even, is visible. But the Bennoch and "Harper" pictures both include a table; the first showing one book, and the second two books placed upon the table-top. The inference from this would be that these two portraits were taken from the two negatives which Bright mentions. Nevertheless, making allowance for a lapse of memory, we may venture to doubt the accuracy of Mr. Bright's recollection. The Bennoch picture and Mrs. Lathrop's both give almost the whole figure; and both represent Hawthorne with one hand resting upon or holding a book. They are alike in size, and both present the same curiously shaped chair, with identical curves and identical knobs and grooves. The ribbed waistcoat in

* "Salem Gazette," June 15, 1886.

the Bennoch likeness seems to be reproduced in Mrs. Lathrop's print; but the latter has been so retouched that it is impossible to decide whether the cloth was ribbed or not. Giving attention to these little particulars may seem irrelevant or funny; but men have been hanged on the strength of cloth, or on the proof supplied by a button; and although the present question is not one of hanging,—except in so far as it affects the position of portraits in a gallery,—we cannot afford to ignore details. The resemblance between the pictures owned by Mrs. Lathrop and Mr. Bennoch is so pronounced, that I am forced to believe they were impressions from the two negatives which Mr. Bright caused to be made.

The original of the "Harper" portrait is much smaller than these, and a great deal more informal in attitude. The size is but little over half-length. But the most significant thing is, that it is the only Hawthorne photograph recorded as taken in England, and that Mayall entered it as taken for Motley. Neither Bright nor Bennoch made allusion to it when they were questioned; hence I conclude that it was really printed at Motley's request. That he obtained the sitting surreptitiously, as I was formerly led to believe, I greatly doubt.

The question has been raised whether it was possible in 1860 to take a sun picture in less than thirty or forty seconds. Mayall has stated that it could not have been done; although Mr. Getchell (a partner of Silsbee, Case & Co., who made an excellent photograph of Hawthorne in 1861-62, engraved for THE CENTURY of May, 1886) says that so early as 1857 he took a large number of photographic portraits with an exposure of only *five seconds* each, by employing French chemicals of exceptional purity. The famous Boston photographer, Black, unhesitatingly avers that the Motley picture could have been made in a few seconds in 1860. Moreover, two Salem photographers now living state that in 1860, under specially favorable conditions, they got good impressions upon the plate in less than *two seconds*. It is barely possible that Mayall put forth unusual exertion and used fine chemicals, in order to secure a likeness of Hawthorne within a few seconds. But the younger Mayall speaks of the shrouded light generally maintained in his father's studio; so that it is not probable that an exception was made in Hawthorne's case. Besides, the well-planned position of the seated figure and the deliberate arrangement of the finger between the book-leaves, in the photograph from which the "Harper" cut was taken (an arrangement ignored and obliterated by the

burin which traced that block), prove almost conclusively that the likeness was not made without premeditation.

The one thing upon which we may now definitely resolve is that Mr. Motley secured a copy of an uncommonly good photograph of Hawthorne, the negative of which was made on the same day and at the same place (viz., May 19th, 1860, at Mayall's) with the other two negatives which Bright and Bennoch liked. Mayall, in short, must have photographed Hawthorne in three positions. Probably Motley was not present at the time, but afterwards had a photograph printed from the third negative, while Bennoch and Bright severally chose the other two; and Bright forgot that three had been made. Bright says that he selected the "intense" view, which was doubtless the same as Bennoch's. But, when Bright ordered a copy sent to Mrs. Hawthorne, in the remote distance of Concord, Massachusetts, it is conceivable that Mayall's subordinates printed off a copy of the "smiling" picture, by mistake, and dispatched it to America.

I may say that Hawthorne's daughter sets a special value upon the Motley (or "Harper") version of her father's face, because it reproduces one of his most characteristic moods,—that mood in which, unconscious of observation, he followed out some train of reverie. The Bennoch picture, however, presents perhaps the truest and most comprehensive rendering of his personal appearance and of his individuality so far as it might be read upon the surface.

Mr. Julian Hawthorne, in a letter to me, speaks of "a carte-de-visite of Fields, Hawthorne, and Ticknor in a group, full length and standing, with their hats on." This curious little souvenir, depicting Hawthorne and his publishers as they appeared in every-day life, on the streets of Boston or in the Old Corner Bookstore, is quite rare. It has never been engraved. Mr. Bennoch, having lately seen a copy of it, referred to it in a private letter as "a portrait of those tall hats. The heads," he added, "and the grouping, remind me of a group of old Jews at the corner of Petticoat Lane, haggling over some recent purchase of 'old clo'." It may be appreciated by the curiosity-hunter, but never by those who loved the originals." I think, however, that Mr. Bennoch underrates the value of this unique transcript from the life. What would we not give to-day for some similar representation of Shakspeare hobnobbing with Ben Jonson at the Mermaid Tavern, engaging in a "wit-combat" with Raleigh, Beaumont, and Donne, or standing hatted in front of the Black Friars' Theatre, between a couple of his fellow-shareholders or fellow-actors?

The costume of Shakspeare's time was certainly more picturesque than that prevailing in nineteenth-century New England. But are we to reject a rare picture of Hawthorne and his publishers, simply because we dislike the absurd tall silk hat of so-called modern civilization? By no means. The photograph may excite a smile, because "stove-pipe" hats are always and unchangeably a ridiculous outrage upon the innate dignity of man; but the smile cannot by any possibility detract from our respect for Hawthorne himself.

I quote again from Mr. Julian Hawthorne's letter:

"Another carte-de-visite of the same date (1861-2) shows Hawthorne seated, in profile, three-quarters length. The Washington photographs were taken a year or two later; they were busts, carte-de-visite size, and show his hair and mustache nearly white. . . . Previous to the Washington period a head, imperial size, was taken in Boston for Mr. Fields, and used to hang in his house; Fields called it the 'Field-Marshal Hawthorne,' from a certain military aspect it had. It has since been copied, and there is an etching of it in the Biography. While he was in Washington the artist Leutze made an oil-portrait of him, which those who have seen it pronounce good. This has never been reproduced, and it concludes the list of his portraits, so far as I know them."

The Leutze portrait was painted at Washington, in April, 1862, about the time that Leutze was engaged upon his large encaustic wall-painting called "Westward the Star of Empire takes its Way," which occupies a panel on the western staircase leading to the gallery of the House of Representatives. Leutze's portrait of Hawthorne is now owned by a gentleman in Brooklyn.

On reviewing the circumstances already set forth with regard to the Bright and Bennoch photographs, the only sound conclusion at which I can arrive is that Mayall, instead of taking only two negatives, as Mr. Bright thought when Bright and Hawthorne went to his gallery, made a third plate, as well; and that he made it as an experiment, without saying a word about it to either of his visitors. It strikes me as a tenable supposition that, while Mayall was talking with Hawthorne and considering the most advantageous position in which to place him, he noticed the easy, natural attitude which his subject had taken at the table, fingering a book. Hawthorne frequently remained perfectly quiet in such a position for two or three minutes at a time. Mayall very likely, on the spur of the moment, took advantage of this habit, and took an experimental

negative. When he was interrogated on the subject, two years ago, he was old, and his memory was feeble: he may not have recalled the incident. Bright, of course, would have known nothing about it, and would have known only of the two views which Mayall then proceeded to take under his (Bright's) direction. One of these Bright selected to be printed for himself. The other Mr. Bennoch afterwards had ordered for *himself*. But Motley was in London at this time, and very likely, hearing that Hawthorne had sat to Mayall, he may have gone to the photographer's atelier to secure a copy of the likeness. On that occasion Mayall perhaps brought out the plate which he had made surreptitiously, and this pleased Motley more than the Bright and Bennoch negatives. From it, therefore, he would naturally wish to have an impression. In speaking of the affair afterwards, Motley — if the circumstances were such as I have suggested — would of course say to his friends that the photograph had been made without Hawthorne's knowledge; and in this way the tradition, with the facility of transformation belonging to all tradition, would become established, that Motley himself had arranged a little plot for obtaining a photograph of Hawthorne unawares.

That Mayall made no record of the Bright (and Bennoch) photographs may be accounted for on the theory that both Bright and Hawthorne wanted to keep the matter quiet, so that copies should not be sought for by the public. But that caution would not apply to the record of another photograph printed for Motley, whose diplomatic discretion was trusted. This explanation is the only one, apparently, which can supply a key to the facts as we have ascertained them, and to the misunderstandings that have gradually arisen.

That the "Harper" picture is taken from the veritable Lothrop-Motley photograph, Mr. Julian Hawthorne clearly believes, as a contribution, over his signature, to the New York "World" of June 26th, 1886, attests. He there says:

"There is no escape from the conclusion that Mayall, on that 19th of May, took three negatives instead of only two, and Mr. Holden says in the 'Easy Chair' that 'Mayall's books show a distinct entry of a print from this same negative, sent to Mr. Motley, 31 Hertford street, Mayfair.' It may claim, therefore, to be the hitherto unseen Motley-Hawthorne-Mayall photograph; but that it was taken in Motley's company or in the manner described by Mr. Holden in his article in the Salem newspaper are positions no longer tenable."

George Parsons Lathrop.

POEMS BY GERTRUDE HALL.

STILL.

THOUGH true it be these glorious dreams
of mine
Are but as bubbles little children blow,
And that Fate laughs to see them wax and shine,
Then holds out her pale finger—and they go;
One bitter drop falls with a tearlike gleam,
Still—dreaming is so sweet! Still let me
dream.

Though true, to love may be defined thus :
To open wide your safe, defenseless hall
To some great guest, full-armed and danger-
ous,
With despot power to deface it all,
A chance at dice whether or no he will,
Still—loving is so sweet! Let me love still.

SINGERS.

MUSICIAN.

HE sings: in all the breathless multitude
Is not one heart so stern, so cold, so rude,
But thrills at his soft notes;
In rapt, uplifted eyes reflected stands
The fair, song-conjured dream of happier
lands
That in each soothed brain floats;
And at the ending of the soul-felt strain,
Whilst at his feet their odorous tributes rain,
The crowds still clamor—"Sing!"
Ah, gods! the mighty triumphs of to-day!—
Such swarms of mad, adoring men to sway
Belongs to no crowned king;
And then, to-morrow—as an echo, dies
The sense of all the tender melodies
That moved the massy throngs;
And then—a name above a churchyard plot
Grown unfamiliar, strange; and then—forgot
The singer and his songs!

POET.

He sings: and such unscornful few as heed,
Say kindly, "Good, perhaps, but what's the
need?"
And others mutter, "Words!"
All has been said that there is need to say.
What does he want, this piper bound to play
Before unlistening herds?"
And so the dreams that dazzled him at dawn
Decline, and as the silent night comes on,
Mad pray'r and protest cease:
Yet sickening hope through failure will abide,
Until the hungry heart—unsatisfied—
In death finds its first peace.

And then—one day the wakening nations say,
"No doubt, this man's was an inspired lay—
Bow to the laureled head!"
And then—he is bewept, and loved, and
praised;
And then—enduring monuments are raised
To him long dead, long dead!

CANZONETS.

I.

WHEN May paints azure all above,
And emerald all underfoot,
And charms to flow'r the withered root,
And warms to passion the staid dove—
Sing, Bard! of Hope, of Joy, of Love!
But when December saddens o'er
The land whence birds and leaves are gone,
When black nights come and gray days
dawn—
Sing, Bard! sing louder than before
Of Joy, Hope, Love!—louder and more!

II.

How can they bear to live together
Whom mutual love hath never moved,
Who, touching lips, are still removed
As wide as upper world and nether—
How can they bear to live together?
Alas! how can they bear to part,
Whom love hath closely bound and blessed,
To wear, each, bleeding in his breast
His torn half of their common heart—
Alas! how can they bear to part?

A SONG.*

NOT the grand flow'r-queen would I ask
to be,
The splendid rose in pure blush-color
drest,—
Only a drop of rain that quietly
In her deep heart might rest.
Not the cathedral with its carven flowers,
Its proud proportions, traceries fine and
fair,—
One of the humble bells that from the towers
Gather the flock to prayer.

Not the sweet poet whom a muse has kissed,—
Only some floating perfume, sound, or beam,
Some faint tint in the fading western mist,
Might make him pause and dream.

* This poem was first printed in the Boston "Beacon."

SOME BOSTON SPIRES. (FROM A PRINT, 1758, IN THE KING'S COLLECTION IN THE BRITISH MUSEUM.)

CHURCH AND MEETING-HOUSE BEFORE THE REVOLUTION.

I. THE EXTERIOR OF THE CHURCH.

THE earliest houses of worship in America belonged to the make-shift order of architecture,—four walls of logs, or a rude framework of wood, clay-plastered outside and in, or of rived clapboards with earth filled in between the rough siding without and the rough ceiling within. The roof was sometimes of thatch, and there was usually a floor. Very few communities built substantial churches at the outset, but as soon as the pioneer struggle was over better places for worship were provided. In New England the first meeting-houses, after the log and thatched ones, were generally framed buildings, nearly square, with what was familiarly called a “tunnel roof”—that is, a roof sloping on all four sides to a point in the middle—with a belfry perched on the apex from which the bell-rope dangled to the floor in the very center of the assembly. Nothing could have less of æsthetic sentiment in it; nothing could have been more baldly utilitarian and more entirely Puritan than this foursquare inclosure. These buildings were appropriately called “meeting-houses”;—they were mere places for assemblage and nothing more,—the work of a people who at first repelled with earnestness the notion of any special sacredness in consecrated places. In this same building assembled the town-meeting with its contentious wrangles; here the magistrates decided the disputes of a litigious people; and here the court sentenced petty criminals and immoral people to the stocks or the whipping-post, which stood conveniently in front of the door. Architecture

of this kind was not quite confined to New England. This almost square house with pyramidal roof was found sometimes among the New York Dutch. The Dutch church at New Utrecht, on Long Island, had a steep funnel roof and the building was six-sided. The first Quaker meeting-house in Burlington, New Jersey, was also hexagonal with a steep roof.

The New Englanders refused to apply the name of church to a building, and when the primitive meeting-house fell into disuse they gave it to the minister to shelter his hay, his horses, and his cows in, or they applied it to some other ignoble use. One Long Island Puritan meeting-house when discarded served the town for a jail. This very secularization of the old building was a solemn protest against what they deemed a papistical or idolatrous notion that holiness could inhere in wood or stone. The Virginians built their first churches with equal rudeness, but when the primitive building of mud-daubed logs and sedge-thatched roof fell into disuse, they surrounded it with a ditch to protect the ruins from profanation by the beasts of the field. This was an act of pure sentiment, for no

colonial building ever received consecration from the hands of a bishop.

The greater part of what we may call the secondary churches in the Southern colonies were, even down to the Revolution, "composed of wood, without spires or towers or steeples or bells, and placed like those of our remotest ancestors in Great Britain in retired and solitary spots, and contiguous to springs or wells," says Jonathan Boucher, the well-known colonial clergyman. Ladles were secured by chains at the springs; there were horse-blocks in front of the church, and in some places sun-dials. But all the buildings were not so simple. The Anglican body in America had its roots in England, and wherever there was wealth enough, efforts were made to follow the prevailing fashion in English ecclesiastical architecture. Some of the early churches, such as Christ Church in Philadelphia and St. Michael's in Charleston, succeeded in attaining considerable beauty of an imitative sort. There have come down to our times a few ancient country churches in the Southern colonies that show the ambition of their builders for decoration,—as a Virginia church with Corinthian pillars the capitals of which are elaborately carved and painted white. But the parish church was rarely more than four wooden walls with a

commonplace roof; sometimes the latter was relieved by a curious dip over the front gables such as one may see in the old St. Thomas, in Maryland, and the Goose Creek church, in South Carolina. Within, the churches of the Establishment often had upon the walls tablets containing the Creed, the Lord's Prayer, and the Commandments, usually in gilt letters on a sky-blue ground. There was also erected, according to law, a table of marriages to keep the parishioners in continual memory that a man might not marry his grandmother or any other of a long list of relatives within the prescribed limit, including the sister of a deceased wife. Stone baptismal fonts were erected in some of the Virginia parish churches before 1692.

The ecclesiastical architecture of New England, which had never been quite uniform, underwent considerable modification when Puritanism itself molted. After the seventeenth century had passed away, there came a new era: the most austere form of Puritanism disappeared; the crusade against long hair, wigs, and witchcraft had spent itself; the increase of luxury softened manners; a slight tendency toward regular ceremonials appeared; by degrees the Bible came to be read in church without exposition, and the psalms to be sung by note and without dictation; prayers were

THE FIRST FRIENDS' MEETING-HOUSE, BURLINGTON, NEW JERSEY (HEXAGON).

presently offered at funerals; and the prevailing squarish meeting-houses with pyramidal roofs began to give way to buildings with some ambition for architectural effect. Even where traces of the old form of meeting-house showed themselves in buildings erected after 1700, the house was in most cases distinctly longer than broad, and the belfry instead of capping a tunnel roof was made to mark the middle of a roof-ridge hipped at both ends. In one case "pinnacles or other ornaments"

pulpit was usually on the side or end opposite the porch. The putting of the pulpit on one of the longer sides in the first meeting-houses may have been a protest against the location of altars or chancels in one end of a church.

II. GOING TO CHURCH.

IN the years following the first planting of the colonies, church bells were few and the custom in vogue at Jamestown, of calling the

RUINS OF THE CHURCH AT JAMESTOWN, VA.

were to be set upon each end of a house apparently with a plain ridge roof. But in the later buildings the belfry often gave place to a tower standing at one of the rear angles of the building and surmounted by a spire. The church porch, which had been present in some of the early meeting-houses, always, perhaps, on one of the longer sides of the building, was sometimes in the later structures at the end, and this, no doubt, marked a change in the internal arrangement of the house, for the

congregation to service by beat of drum, prevailed very generally where the people lived within hearing distance. We should, perhaps, mistake if we supposed this to be merely the adaptation of a military usage; the village drummer was only a variety of the town-crier or bell-man. In the absence of newspapers and handbills, he beat his drum in the most public places whenever anything of importance was to be cried, and time-pieces being wanting, he was in some towns engaged to announce the

ST. MICHAEL'S CHURCH, CHARLESTON, S. C.

hour for beginning daily labor and the arrival of bed-time. Nothing was more natural than that he should also rattle his drum in the streets on Sunday morning to bring the clockless people to meeting in time. In primitive New Haven the Sunday morning drum was beaten by the drummer standing on top of the meeting-house, that those who lived afar might hear. The old New England meeting-house was often perched on the top of a high hill, and a flag was sometimes raised as a signal to worshipers living too remote to hear a drum. It was a more common plan to blow a conch-shell dinner-horn in the streets. An old verse with a good anti-climax preserves the memory of this custom :

“New England’s Sabbath-day
Is heaven-like still and pure ;
Then Israel walks the way
Up to the temple’s door ;
The time we tell
When there to come
By beat of drum
Or sounding shell.”

The Sunday morning drum-beat, the conch-shell blown in the streets, and the signal flag flying from the top of the meeting-house, lingered in some places until well on toward the close of the colonial period.

In the Middle and Southern colonies where dwelling-houses were widely scattered on large private plantations and where boats, small periaugers, and canoes were favorite vehicles for travel, some of the earliest churches stood conveniently by the waterside, and meetings held in private houses were located with reference to the prevailing modes of getting about. Nothing could be more animated than the scene upon the water at such gatherings. The concourse of boats in which the Maryland settlers had come to one of George Fox’s meetings made the stream in front of the house “look like the Thames.” An Italian traveler at a later period gives us a lively picture of a similar scene in the Maine woods, where the people, after listening to a sermon preached in a barn and then dining together at a neigh-

boring house off a large boiled cod, embarked in a fleet of canoes, discussing the doctrine of the preacher as they paddled homeward.

Eating together after the service was a very common practice in thinly settled regions, and

family should live so near to the meeting-house that people could attend church without straining the fiber of the fourth commandment. But when the common lands came to be more and more divided, and farms and out-hamlets were

INTERIOR OF THE OLD GOOSE CREEK CHURCH, SOUTH CAROLINA.

it afforded a good opportunity for the gratification of the social instinct. To Sheldon Church, in South Carolina, there came seldom less than sixty or seventy carriages, but a neighboring planter was accustomed to entertain the whole assembly; those of higher social position he invited to his own table, while common-folk were provided for by his overseer at the planter's expense. At great Quaker meetings a similar unstinted hospitality was dispensed by the wealthier Friends. In New England care was taken at first that every

settled. people had to travel farther. In the winter time the people from a distance spent the time between the two services by the fire-side in the kitchen of the parsonage-house, or in that of some other neighbor who heaped up wood against the great back-log to cheer the worshipers when they came chilled to the marrow from the frosty air of the meeting-house.

The custom of building churches without appliances for warming them was very general, especially in the colonies north of Pennsylvania, and was no doubt brought from

A FOOT-STOVE.

Europe; one may yet sit through service in fireless churches in Holland, Switzerland, and elsewhere on the continent. In a climate so severe as that of New England it must have added much to the grizzly rigor of the religious observances. Judge Sewall records in his diary, on a certain Sunday in January, 1686, when Boston harbor was covered with ice: "This day so cold that the Sacramental Bread is frozen pretty hard and rattles sadly as broken into the plates." Though in most places no one ever dreamed of warming the building, yet measures were sometimes taken to mitigate the cold; the first church in Lynn, for example, was made to descend to low caves on the side exposed to the north-west wind, and the floor was sunk below the ground. In New York, in 1714, servants are described as carrying foot-stoves to church for the use of their masters and mistresses, and foot-stoves were likewise used in New England in the eighteenth century.

In one Quaker meeting in Pennsylvania it was provided, in 1699, that a fire should be kept in an upper room, "for such as are weak through sickness, or age, or otherwise, to warm at, and come down again modestly." But at a later period we find some of the Friends' meeting-houses warmed with German stoves. The Southern parish churches were probably not generally warmed, but it was provided in a colonial parish, as far south as North Carolina, that the clerk and lay-reader should also build fires wherever they were needed. There were even some exceptional towns in New England that had iron stoves in their meeting-houses as early as 1730, though most of them resisted the improvement until after the beginning of the nineteenth century.

In Connecticut, perhaps more than anywhere else, Sunday was a sort of popular idol, nor did the rigor of its observance abate per-

ceptibly until long after the Revolution. This extreme scrupulosity about Sabbath-keeping was doubtless the moving cause of the building of the "Sabbath-day houses"; these were little shanties standing on the meeting-house green, each intended to accommodate a family during the interval between the two services. Some Sabbath-day houses were built with a stall at one end to shelter the horse, while the family took refuge in the other, where there was a chimney and a meager furniture of rude seats and a table. Here on arrival before the first service the owners lighted a fire and deposited their luncheon, and to this camp-like place they came back to eat their doughnuts and thaw themselves out after their first long sitting in the arctic climate of the meeting-house. Sometimes two families had a Sabbath-day house together; sometimes there were two rooms in a Sabbath-day house that the sexes might sit apart—for nothing so agreeable as social converse between boys and girls was permitted during the consecrated time. But some parishes in Massachusetts, and perhaps elsewhere, had a common "noon-house" for all comers to rest in. Fireside assemblages on Sunday, whether in the parsonage or the noon-

EARTHENWARE STOVE AT NAZARETH, PA., USED BY THE MORAVIANS BEFORE THE REVOLUTION.

house, were in danger of proving delightful to those who were prone to enjoy the society of other human beings, and hence the pastors "were put upon their best contrivances" to have most of the interval between the services filled up with the reading aloud of edifying books and other exercises calculated to keep the mind in a becomingly irksome frame.

The New England reverence for the Sabbath tended to repress social enjoyment in the accidental encounters of Sunday, but the week-day lecture suffered from no such restriction, and was for a long time much more in favor than even the Sunday service. From all the country round, in spite of the poverty and difficult conditions of pioneer life, people flocked to these week-day assemblages. Cotton's lecture in Boston was so attractive that it was found convenient to establish a market on the same day; punishments in the stocks, in the pillory, at the whipping-post, or on the gallows, were generally set down for lecture-time, perhaps in order that as large a number of people as possible might be edified by the sight of a sinner brought to a just retribution. Nor did these exhibitions of flogging, of cutting off ears, and of men sitting in the stocks, or dangling from a gallows, tend to diminish the attendance. At one period during Philip's war scarcely a Boston lecture-day passed for a number of weeks without the congregation being regaled with the sight of the execution of one or more Indians. When heretical or seditious books were condemned, it was decreed that they should be solemnly burned "just after lecture." Elections were appointed for the same time at first, and the early popularity of the Thursday lectures in Boston and Ipswich fixed the annual Thanksgiving festival on that day of the week. The largeness of the assemblies at lecture-time gave some uneasiness to the magistrates in the first years of the colony; they were concerned to see people who could ill spare the time going to three or four lectures in different places during the same week. They saw that young people made attendance on lectures a pretext for enjoying themselves, and they had a reasonable fear that the hospitality exercised on such occasions might become burdensome. As early as 1633 the magistrates interfered to fix the hour of the lecture at one o'clock or later, that the people might take their midday meal at home. The next year they persuaded the ministers about Boston to arrange their lectures in alternate weeks, that four contiguous towns might afford but two lectures a week. In 1639 the rulers again sought to regulate the hour of lecture, but this brought the clergy on their backs, and the next year all restrictions were repealed, and the week-day lecture long re-

mained a time of common assemblage, of business convenience, of hospitality, and of great social enjoyment.

III. SEATING THE CONGREGATION AND KEEPING ORDER.

IN the churches of the English Establishment in the colonies the people of consequence sat in family seats or pews, which were in some places accounted private property

RAISED SEATS IN THE OLD FRIENDS' MEETING-HOUSE AT BIRMINGHAM, PA. (ON THE BATTLEGROUND OF BRANDYWINE.)

and descended from father to son. At Williamsburg, in Virginia, the pew seems to have been an appurtenance of the residence, and to have been sold with it. In many churches the gallery was the place of dignity, a conventional idea that is yet retained in parts of the British Islands. In the old Virginia church at Grub Hill the leading families were so jealous of their rights of property in the very uncomfortable pews under the roof that they refused to suffer the gallery to be taken down after its decay rendered it necessary to support it by props. The church at Annapolis is a good example of the spirit of the time. Here, in the new building of 1774, pews were set apart for the governor, the speaker, the members of the Upper and those of the Lower House, and the judges. Even jurymen had a reserved seat, and everybody was, by act of the Legislature, assigned to his proper position in the church according to his official dignity or the amount of money he had given to the building; only the gallery was reserved for those who had no pews. In the older Annapolis church the same system seems to have prevailed, for in 1745 after Whitefield had preached a Fifth of November sermon to a great congregation, the iron ornament used to designate and decorate the pew of the speaker fell and hurt seriously two of the members of the Assembly in the next pew to that of their presiding officer. It was thus that a provincial government made the worship of God a public act, performed by all its functionaries in their due

OLDEST MEETING-HOUSE IN NEW ENGLAND (HINGHAM, MASS.).

order and array, and with all proper fuss and parade.

Indeed, among all sorts of religious people at that time the house of worship was believed to be the proper place to air one's superiority. In the primitive New England meeting-house it was not accounted safe to permit the two sexes to occupy the same seats or even to sit upon the same side of the house, but the heads of families on each side were sedulously pigeon-holed according to what was deemed their relative rank, and sometimes even the young people in the galleries were thus classified. There was no trace of democratic sentiment in the earlier days, and respect for social rank was a very important department of religion. In some places the seating was adjusted mathematically by the tax-book, according to the amount of estate set down to each householder; in others, as in Brookhaven, on Long Island, and elsewhere, it was shrewdly fixed by the relative liberality of contributors to the church treasury, but in most New England towns an anxious committee undertook the dreadful task of weighing all those considerations, palpable and impalpable, of property, family, professional dignity,

official position, age, and what not besides, that go to make up social standing. Preliminary to this another committee was appointed to "dignify the meeting-house,"—that is, to fix a relative rank to the several seats. Such was the ambition for the higher seats in the synagogue that the villagers sometimes refused to accept the places assigned them, and shameful disorders were the result of a contest for place, so that some towns found it needful to impose a sharp fine on aspiring people who endeavored "to advance themselves in the meeting-house."

The matter of ecclesiastical rank was more definite and more easily settled. The New England hierarchy was carefully ranged in the light of the apostle Paul's epistles. The "teaching elders," or ministers, of whom most churches in the first years of the colonies had two, occupied the highest seat behind the pulpit, or as Cotton took pains to call it, "the scaffold." When the minister and his family entered the door the congregation rose and remained reverently standing until he had mounted to his place. The "ruling elders'" seat was a high bench in front of the pulpit and facing the people, and the deacons sat in

a seat yet one degree lower down. In the like spirit we find the Goose Creek parish church in South Carolina setting apart in perpetuity the front pews of the middle row for the church-wardens and vestrymen and their successors forever, while some churches built pews specially for the church-wardens. And notwithstanding the protest of Friends against man-worship, the Quaker meeting-houses had "galleries" or raised seats, in order to give this sort of precedence to leading members and ministers; though when it came to preaching the Public Friend had no pulpit, but mounted upon a preaching-stool.

The seating of church officers in conspicuous places had a certain justification in the practical necessity that there was in that ruder time for awing into decent behavior the inconsiderate youth and the disorderly. In New England meeting-houses a tithing-man or some equivalent official was put in charge of the boys, whose meditations were rendered appropriately solemn by a rod held in plain sight and sometimes rapped against the wall in an admonitory way. In Lynn, and perhaps elsewhere, the tithing-man went about the meeting-house with a long wand having a ball on one end with which to tap any man who should be overcome by sleep; from the other end of his wand there dangled a fox's tail; with this he politely brushed the faces of the women when he caught them dozing. One frequent sleeper incontinently struck the tithing-man for disturbing his repose; he was thereupon sent to the whipping-post for "common sleeping at the public exercises." The tithing-man had an arduous time of it, between waking up the sleepers, keeping the disorderly quiet, and driving away the rabble of dogs which were bred in that day as a defense against wolves, and which appear to have given almost as much trouble in meeting-time as the boys. The pestiferous boys were relegated to the galleries; and in one church two men were specially appointed to watch them "that they might be contained in order." On report of the tithing-man a lad was liable to be "called forth" and reproved by the minister, and if this were not sufficient he could be made to answer to the justice, and one boy was sent to the whipping-post for fighting in meeting. In New London the sexton was charged with digging graves, sweeping the meeting-house, "ordering the youth in meeting-time, and beating out the dogs"; but the Andover people hit upon a plan of settling the dog question by levying sixpence on the owner of every dog that should intrude into the service. With the increase of luxury and refinement and the relaxation of religious rigor, the narrow slips with their hinged seats, which

were raised when the people stood up and let down again with a great clatter, gradually gave way to square pews topped with turned balusters, in which families sat together to the increase of decorum in the congregation. The tithing-man and his stick went out of existence, but even in the pews the irrepressible youngsters found chances to beguile the tedious Sunday hours by whispering between the balusters to their friends in the adjoining compartments. These square pews had probably always been in use in some places in New England; in one primitive church built in 1637 they were appropriately called "pitts," and were five feet "deep" by four and a half in diameter. In 1692 we find a New England town giving permission to leading parishioners to build private seats in the galleries, after the fashion prevailing in some of the Episcopal churches. The square family pews seem to have come into general use in New England gradually after 1700.

IV. THE SERVICES.

THE prayer at the opening of a New England service was at first about a quarter of an hour in length. It was usually preceded by the reading of "bills put up for prayers," that is, requests from persons in affliction or difficult circumstances for the prayers of the church in their behalf. The prayers of the minister were weighed and valued along with the sermon, and more than one minister was esteemed for his talent in extemporary prayer. The Pilgrim, Elder Brewster, at the very outset, was praised for his "singular good gift in prayer. . . in ripping up the heart and conscience before God." But Brewster knew that the hearts of the weak could not "stand bent" too long and he disapproved of prolixity in prayer. It early became the fashion in Massachusetts, however, to affect a robust length in devotion, and particularly to imitate the public prayers of the learned John Norton of Boston, in which "there was a variety, fullness, and fervor seldom equaled." One enthusiastic worshiper was accustomed to journey thirty miles on foot to attend the Boston Thursday lecture, accounting himself well repaid if he could only hear one of Norton's prayers. Some young ministers improved so much under Norton's lead that they were able "to continue their addresses to God for more than an hour with much propriety," and, if you will believe it, "without wearying those who joined with them."

Norton's predecessor, John Cotton, would sometimes on a fast or Thanksgiving day spend five or six hours at a stretch in prayer and exposition, "so indefatigable was he in the Lord's

work," says his biographer, and so indefatigable were the hearers of that day, we may add. It is recorded that another early preacher "continued in preaching and prayer about the space of four or five hours"; it does not seem necessary for the historian to add that he was "a painful minister." Urian Oakes had been seen to turn his hour-glass four times, and Cotton Mather, with characteristic vanity and bad taste, sets down in his diary that at his own ordination he had prayed an hour and a quarter and preached an hour and three quarters. "Wee have a strong weakness in New England," wrote Nathaniel Ward, "that when wee are speaking wee know not how to conclude; wee make many ends before wee make an end." But the New England sermons were generally limited to an hour, or at most to two. The appetite for devotional exercises and religious discussions was enormous. Not content with Sunday services which had something of eternity about them, and equally protracted week-day lectures, the early New Englanders took pleasure in turning their dwellings into oratories by holding private meetings with a company of invited guests. At these services there was usually a sermon with no end of psalms and prayers. Refreshments of food and wine were also served to the company on these occasions, for the private meeting was the Puritan substitute for a social assembly. In that day the sermon was almost the only intellectual food, and the religious assembly was the principal means of escape from isolation.

In all sorts of places of worship in the colonies, the singing, where there was any, was by the whole congregation, following some leader who "set" the tune without any knowledge of musical notation. The art of reading written music was forgotten, and the very memory of the tunes became corrupted by oral transmission. The same tune varied essentially as sung in congregations but a few miles apart; sometimes only the name of the old tune remained, the music having been "miserably tortured and twisted and quavered into a horrid medley of confused and disorderly noises," as one writer testifies in 1721; and the same witness declares that the singing was so "dragged" that he himself had been obliged to take breath twice in one note. The entire number of tunes in general use was but eight or ten; some congregations were reduced to half that number, and frequently a service had to be held without singing for want of a leader who could "take the run of the tune." In New England the frequent singing of the same psalms and the more frequent use of the same tunes in private as well as in public meetings, and on all sorts of accidental occasions,

were enough to have proved intolerable to any people not impervious to ennui. Ten psalms were sung at one private meeting in Boston of which a record has come down to us. In public services the metrical psalms were "dictated," that is, read off line by line by one of the deacons: the process was known as "deaconing off."

The versions in use everywhere in the seventeenth century were ludicrously rude, literal, and unpoetical. But they were not literal enough to satisfy the reformatory ambition of the Puritans of the New World, and in 1640 three of the most prosaic ministers of Massachusetts were set to make a new version. "We have endeavoured," says one of these, "according to our light and time to retranslate the psalms as neer the originall as wee could into meeter because the former translation was very defective." The new rendering, especially after it had been revised in 1650, became very popular and passed through many editions in England and America. But reading its hitching lines is serious work, like riding in a springless wagon over a pioneer road in the mountains: that such verses could ever be sung is almost past belief. And psalm-singing appears to have been no whit less rude in the colonies to the southward. One of the reforms advocated by Bray in 1700, when he made his brief dash into Maryland as Commissary of the Bishop of London, was the teaching of catechumens to sing the psalms "artificially." And seventy-five years later, at the outbreak of the Revolution, Boucher declares that in Virginia and Maryland the psalmody was "everywhere ordinary and mean." There were not six organs in both colonies, and there were churches in which there was no singing at all.

In the early part of the eighteenth century there began in New England a movement in favor of better singing in the churches. It was part of the reformatory current of that time. But the change from the old-fashioned nasal "quavering" and droning of a dictated psalm in the wake of a leader who, without any knowledge of music, was barely able to "take the run of the tune," to the use of note-books was a violent one, and from about 1720 onward it threw many a village into protracted and bitter dissensions. So sacred in the eyes of the people were the old psalm-tunes that they were wont to take off their hats if they but heard one of them hummed without any words. The opposition to change was vehement: sometimes the stubborn deacons defeated the majority of the church by continuing to read the psalms line by line; in some cases church councils had to be called to mediate between the parties, and some learned books were written on the points of conscience

involved in a conflict between good music and bad. To the conservatism of that time "singing by rule," as it was called, savored of liturgical, not to say papistical, pomp and ceremony.

By degrees, after a contention that was not quite ended in half a century from the time of its beginning, the "new method" prevailed generally in New England, and a particular excellence seems to have been attained in the Connecticut valley. The Northampton congregation in Jonathan Edwards's time was conspicuous for the correctness of its singing; it "carried regularly and well three parts of music, and the women a part by themselves." At Middletown, John Adams says in his diary in 1774, "went to meeting and heard the finest singing that ever I heard in my life; the front and side galleries were crowded with rows of lads and lasses who performed all their parts in the utmost perfection." Here, as at Northampton, the women had apparently "a part by themselves." "A row of women," says Adams, "all standing up and playing their part with perfect skill and judgment added a sweetness and sprightliness to the whole which absolutely charmed me." But musical improvement got no farther South or West. An organist from Bristol had advertised himself in New York in 1754 as desirous of amending the singing in the public congregations, but probably in vain. In 1774, Adams found the singing among the New York Presbyterians "in the *old way* as we call it—all the drawling, quavering, discord in the world"; and when he gets to Princeton he writes: "The scholars sing as badly as the Presbyterians in New York." The chanting in the Catholic church in Philadelphia he found "exquisitely soft and sweet." The fervent emotional singing of the newly planted Methodists in Philadelphia impressed him deeply; he describes it as "very soft and sweet indeed, the finest music I have heard in any society except the Moravians, and once at church with the organ."

The non-conformists of every shade pushed the reaction against ritual service and religious art to the greatest extreme. Until long after the opening of the eighteenth century a Puritan, a Quaker, or a Baptist meeting-house was usually as naked of ornament as a barn, and the worship was scrupulously divested of everything that might give æsthetic pleasure. Against instrumental music all the bodies dissenting from the Church of England entertained an inveterate prejudice. The Friends, and, before 1700, the Baptists, rejected even the poverty-stricken psalm-singing of the time. In the early years of the settlement the Puritan ministers wore gown and bands, and the Virginia Episcopal clergy wore no more; the use

of the surplice did not become customary in the Chesapeake region until after the beginning of the eighteenth century. As time advanced the Puritan clergy gradually discarded the clerical robe. At the Revolutionary period only two — Cooper and Pemberton of Boston — wore gown and bands, and they were sarcastically said to use them to distinguish themselves from "the inferior clergy."

An example of the tendency to conform to the very letter of Scripture in the matter of rites is found in the mode of administering the Lord's Supper in the Presbyterian churches in Philadelphia. The communicants sat down at a long, narrow table "spread in the middle of the alley," and reaching from the deacons' seat to the door. The Presbyterian ministry of the Middle colonies preached without notes, in which they differed from the New England divines, who in the eighteenth century had almost universally adopted the use of written sermons in the pulpit. In the manuscript journal of a French traveler in America during the Revolution, which is preserved in the National Library at Paris, I find a description of the general features of worship in what the writer calls an American Protestant church. From the connection one is led to infer that it is a Presbyterian church in the Middle colonies. "A long building without vestibule, pierced by windows enough to give sufficient light, and two or three doors on as many sides, with steps leading up to the level of the floor; a steeple, whose spire is very high and quaintly decorated, placed at one of the back corners of the building; the ceiling and walls within well whitened, or sometimes wainscotted; the four sides of the pews carried up so high that he who sits can see neither his neighbors nor those who come and go,—such is commonly the body of the church, the nave. Now imagine if you will a higher bit of wainscoting with candles or chandeliers hanging above a wholly plain table or pulpit; this stands for what we should call the chancel. For the choir there is at one side of the church by this same pulpit a layman with nothing to distinguish him from the rest; he sits facing the congregation and intones one line at a time of David's psalms versified in English. Over against him are the members of the congregation who respond alternately to the end of the psalm." It is clear that what our traveler calls "intoning" was merely the "lining" or dictating of the psalm by a precentor. This, he says, is almost all there is of "the office." He thinks the sudden appearance of the minister in the pulpit very dramatic,—he cannot tell how he gets there. "You perceive all at once a personage in black with a big periwig and the costume of a *procureur*, who addresses the

assembly with earnestness. For three-quarters of an hour or more, but without divisions, coughing, expectoration, or nose-blowing [*sans division, tousserie, cracherie, ni moucherie*], he extemporizes, recites, or reads a discourse on the gospel and its morality, often very fine and very justly put, and often, also, quite as fanatical as some of ours."

At the close of the sermon, our traveler tells us, the minister "makes a sign apparently agreed upon between one of the auditors and himself." A man comes forward holding a long rod "at the end of which, almost as on a fishing line, is suspended"—probably a bag or box for the collection, but our innocent foreigner calls it "*the square hat of the preacher.*" This the man who has been called out "presents in recommending the speaker to the liberality of all," which closing with the collection recalls a very different method of taking it in the New England churches in the seventeenth century. One of the deacons at the close of the service was wont to remind the assembly that there was "time left for the contribu-

tion." Whereupon, in the order of dignity, magistrates and chief gentlemen first, then the elders and all the men in the congregation each in his turn, and the single women and widows and women whose husbands were absent, went forward or came down from the gallery marching two abreast, up one aisle and down the other. Each as he passed the deacons' seat put money into a wooden box held in the hands of one of the deacons. The gifts were generally liberal for the time; some gave a shilling, some two, some half a crown, and some as high as five shillings. Lacking money they might put into the box written promises to pay which were to be redeemed within a month, or deposit alongside the box some article of value to be used or disposed of for the benefit of the ministers or the poor.

And so, the collection having been decently taken, we close this sketch of some of the chief external features of worship among our ancestors, leaving for subsequent papers the treatment of more essential traits of that religious life which is the key to so much in their history.

Edward Eggleston.

THE VEDA.

HE name Veda has grown to be a familiar one in the ears of this generation. Every educated person among us knows it as the title of a literary work, belonging to far-off India, that is held to be of quite exceptional im-

portance by men who are studying some of the subjects that most interest ourselves. Yet there are doubtless many to whose minds the word brings but a hazy and uncertain meaning. For their sake, then, it may be well to take a general view of the Veda, to define its place in the sum of men's literary productions, and to show how and why it has the especial value claimed for it by its students.

The Veda is the Bible of the inhabitants of India, ancient and modern; the Sacred Book of one great division of the human race. Now, leaving aside our own Bible, the first part of which was in like manner the ancient Sacred Book of one division of mankind, the Hebrew, there are many such Scriptures in the world. There is the Koran of the Arabs, of which we know perfectly well the period and author; the Avesta of the Persian "fire-worshippers," or followers of Zoroaster; the records of ancient China, collected and arranged by Confucius; and others less con-

spicuous. All are of high interest, important for the history of their respective peoples and for the general history of religions; yet they lack that breadth and depth of consequence that belongs to the Hindu Veda. This is what we have to explain.

The (Sanskrit) word *veda* signifies literally "knowledge"; it comes by regular derivation from a root *vid*, meaning "see," and so "know." Here is found a first intimation of the relation of the Veda to us; for this root *vid* is the same that lies at the basis of the Latin *video*, "I see" (whence our *evident*, *vision*, etc.), of the Greek *οἶδα*, "I know," and of our own Germanic words, *wit*, *wot*, *witness*, and so on. It is a sign of that community of language which binds together into one family most of the peoples of Europe and a part of those of Asia, showing their several histories to be, in a more peculiar and intimate sense, branches of one common history. In the following table is given a little specimen of the evidence that proves this:

English	two	three	mother	brother
German	zwei	drei	mutter	bruder
Slavic	dwa	tri	mater	brat
Celtic	dau	tri	mathair	brathair
Latin	duo	tres	mater	frater
Greek	duo	treis	meter	phrater
Persian	dwa	thri	matar	
Sanskrit	dwa	tri	matar	bhratar

We know enough about the history of human speech to be certain that such correspondences as these—and their like are scattered through the whole vocabulary and grammar of the languages in question—are only explainable on one supposition, that the tongues which contain them are the common descendants of one original tongue; that is to say, the dialects of German, Slavonian, Celt, Roman, Greek, Persian, and Hindu are the later representatives of a single language, spoken by a single limited community, somewhere on the earth's wide surface, somewhere in the immeasurable past—where and when, we should like very much to know, and mean to find out if we can; but as yet we do not know anything whatever that is definite about it. We call this great body of related languages—carrying with it by inference a relationship also, at least in good degree, of the peoples speaking them—the Indo-European or Aryan family; and we acknowledge something of kinship with every member of the family. It is not, perhaps, a very lively feeling; cousinship loses much of its charm when expressed in high numbers; yet, as we have a certain warmth of sentiment in foreign lands toward even an unrelated countryman, so, in wandering up and down the wastes of human history, we cannot but feel drawn toward those who really speak our own speech.

One great division of this family of ours we find in Asia, occupying Iran (Persia, etc.) and India: the Aryan division, according to the best use of this name, since the ancient peoples of both these countries, and no others, called themselves *ârya*. Their oldest dialects of which we have any record, those of the Avesta and the Veda, are hardly more unlike one another than are English and Netherlandish; and as in the latter case the narrow North Sea separates the two parts of an only recently divided people, so in the former case the highlands and passes of the Hindu-kush do the same. As the English crossed the sea from Low Germany, dispossessing the Celts, so the Indian branch of our kindred stole into India (doubtless more than two thousand years before Christ) through the same gorges that now connect and hold apart India and Afghanistan, and began the conquest of the great and rich peninsula. There we see them still; occupying with their own dialects only the northern part of the country, while the aboriginal "Dravidians" still hold the south; but permeating it all with their influence and institutions; grown to num-

ber many scores of millions; possessed of a civilization of native growth and high grade; with literatures and arts and religions that have overrun a great part of Asia—in short, a leading factor in universal human history.

All this, and how it came about, is a matter of only recent knowledge. By a strange fate, this easternmost branch of our family has fallen, within the last century or two, under the dominion of one of the westernmost members, the English. The story of its subjection is well known, and need not be more than alluded to here. The wisdom and the wealth of India had always been the admiration of the world; it was not, however, curiosity as to the wisdom that brought knowledge: rather, greed for the wealth. Almost everywhere in human history the lower motives are immediately efficient; and a band of adventurous traders, seeking material profit, threw open also the intellectual treasure-house of India. The wars and intrigues by which an English commercial company became masters of the destinies of the country, turning their charge over later to the British crown, form a striking chapter of modern history. For near nine hundred years India has been the prey of foreign conquerors and oppressors. The English are merely the last, and by far the best, of their long series.

They found in this immense and highly civilized country a host of varying languages, dialects of more than one great family, with abundant literatures. They also found one language, the Sanskrit, reputed of immemorial antiquity, held sacred by the real Hindu every-

SKETCH-MAP OF INDIA.

This sketch-map shows (shaded) the part of the peninsula still possessed by the Dravidian dialects, after some four thousand years of encroachment on the part of the Sanskrit and its descendants. The entrance of the Aryans was on the extreme north-west, through the valley of the Cabul river. The region probably occupied by them in the early Vedic period is distinguished by being dotted.

where, read by the educated, and even spoken and written by the leading class, the priestly caste of the Brahmans. Precisely so might the Mongols, had they completely ravaged Europe in the Middle Ages, have reported to their countrymen concerning the diverse tongues and literatures of that region, and the Latin as common dialect of the learned, especially of the Romish hierarchy: the analogy is a close and instructive one. This was a sufficiently notable condition of things; but the interest of the world was greatly heightened when it was discovered that this learned and sacred idiom of India, the Sanskrit, is related with nearly all the languages now spoken in Europe, and with the ancient ones that we most value (as Greek and Latin), and that it is in many respects entitled to the leading place among them; that it casts more light than any other upon their common history and origin. In the excitement of such a discovery, many scholars lost their heads, and extolled the Sanskrit and its literature far beyond their deserts, even holding that this was the original tongue of our division of mankind, and the source of literary culture for the rest of the world; and the echoes of these errors may be heard dimly reverberating here and there among the nooks and corners of literature even of our own day. But—thanks in no small measure to what the Sanskrit itself has taught us—such matters are much better understood now. Every language is all the time changing; and hence we could never find the original Indo-European tongue except in documents coming down from the very period of Indo-European unity; and that lies perhaps thousands of years back of the time of the earliest Sanskrit. We have, too, no reason to believe that any culture was carried from India to nations beyond its borders until the missionary period of Buddhism, not far from the Christian era. But the study of Sanskrit, chiefly as the mainstay of Indo-European comparative philology and of the general science of language, has become an integral part of the system of modern education, a department of classical learning standing along with Latin and Greek, and coming next them in practical importance.

All this is a necessary introduction to an understanding of the value of the Veda. We need to note what are the relations to us of the people to whom it belonged, and of the language in which it is written.

The opening of India, as we see, gave us the ancient Sanskrit language as an instrument of linguistic research, and laid before us the immense Sanskrit literature, as a part of the archives of our division of the human race, to be studied and comprehended. A task, this,

of no small difficulty; and the more, since the element of history is wanting in the literature. The Hindu is great in constructing systems of absolute truth, but he despises a record of facts; he has a scheme of astronomical cycles reaching back almost into infinity, and can tell precisely how many days ago the creation of the universe was completed;* but he cannot give the real, prosaic date of any event, civil or literary, back of our Middle Ages. We are left in the main to work out by internal evidence the order of succession of the parts of this literature, and then, with help of the chance notices of foreign visitors, to determine what we can as to their absolute date; and the problem is yet far enough from being solved. At what time were composed those two tremendous epics, the Râmâyana and Mahâbhârata, in comparison with which the Iliad or the Odyssey is but a ballad? No one can tell; at any rate, a good while ago. How old are the laws of Manu, from which certain people stoutly maintain that Moses must have derived his legislation for the Hebrews? That is equally unknown. Of the latest and best authorities, some set them a little before Christ, others a little after. And the period of the leading dramatic poet, the author of Çakuntalâ, has been reduced from 100 B. C., as claimed by early students of India, to 5–600 A. D.

But it is at any rate possible in this literature, as in every other, to lay out in a broad and general way the history of growth, divide it into successive periods, and determine what is oldest in it. Everywhere throughout it the Veda is acknowledged as its beginning, is regarded as a revelation on whose authority everything else reposes. The sacred literature of Christianity does not point any more clearly to the Bible as its foundation than the sacred literature of Brahmanism to the Veda. It was a considerable time, however, before European research had cleared the way for dealing directly with the Hindu revelation. The name Veda to the Hindu signifies a very extensive and heterogeneous mass of writings, covering a space of time and of growth like that from Moses to Christ; and the later parts of it are those which the modern Hindu best understands and most values, as being nearest to his own age and thought. Manuscripts of its older parts were comparatively rare, and less freely furnished to the curiosity of the stranger; yet they gradually gathered in European hands, and in 1805, some thirty years after the opening of Indian literature to the knowledge of the world, the illustrious English scholar Colebrooke, in an essay since become famous, was able to give a comprehensive and

* Namely, if any one cares to know, 714,404,118,434 days before January 1, 1887.

fairly correct survey of the whole vast field — without, however, at all fully comprehending the relation of its parts, or realizing the supreme importance of some among them. Yet a generation passed before anything further of consequence was done; then the work fell into the hands of the great German scholars whose names will be always associated with it — Rosen, Roth, Benfey, Weber, Aufrecht, Müller — and a new era was inaugurated, in the study of Indian antiquity, and in that of the antiquities and religion of the whole Indo-European race.

As a matter of course, the Hindus have all sorts of absurd stories to tell about their sacred literature. That it is of divine origin, revealed from all eternity, miraculously preserved and re-revealed at each new destruction and recreation of the universe, “goes without saying”; few Oriental peoples have failed to claim as much as that for their Scriptures. Then they tell of a certain holy *rishi* or sage named Vyâsa, by whom the mass was collected and put in order. *Vyâsa* means “arranger”; so it is as if people were to hold that a saint named Editor brought into shape the two Testaments and the Fathers for the after use of the Christian church. But the Hindus have done their full share by handing down to us, with a reverential and painstaking care that has not its equal anywhere else in the history of literature, their sacred books, not at all comprehending their historical relations, and only in part understanding their contents: ours is the task to bring true order and intelligence into the chaos.

We find the whole body of inspired writings divided into four parts, each of which is called a Veda: the Rig-Veda, Sâma-Veda, Yajur-Veda, and Atharva-Veda. Each division has its schools of more special votaries, by whom it is handed down; each has its assortment of works, in prose and verse, devotional, ceremonial, expository, and theosophic. But at the head of each stands a collection of sacred utterances, chiefly poetic, which we have no difficulty in recognizing as their oldest part, the nucleus about which everything else has gradually gathered; all the rest presupposes these, as plainly as the Talmud the Old Testament, or the writings of the Fathers the New. They are in a language in many respects peculiar and evidently older, a more primitive dialect of the primitive Sanskrit. Among these four collections, the superior interest of one is seen on the briefest examination; it is the Rig-Veda, an immense body of hymns to the gods, of sacred lyrics, with which the remote ancestors of the present Hindus praised the divinities in whom they believed, accompanied their sacrifices, and besought blessings. We cannot

compare them with our hymns, because these imply so much that is earlier, out of which they have proceeded; the Vedic songs are more like the Psalms of David. There are more than a thousand of these songs, and they contain over ten thousand two-line stanzas — a body of text about equal to the two Homeric poems taken together, or twice as much as the great German epic of the Nibelungen. The collection is an orderly one, arranged in ten books, chiefly according to a tradition of authorship that appears to be genuine; hymns of the same author, or clan, or school of authors are put together. But the last book is a kind of appendix to the rest, containing in part material of a peculiar character, later, more superstitious, and with some miscellanies of quite exceptional interest. Inside the divisions, the hymns are arranged chiefly in the order of the divinities addressed. The two gods most often worshiped — their praises together fill almost the majority of hymns — are Agni and Indra: Agni (Lat. *ignis*), the fire, the medium of sacrifice, the divinity on earth, in bodily presence before the eyes of his worshipers, the messenger between earth and heaven, who bears the oblations aloft to the other gods, or about whose flame the gods gather to receive their share of the offering; and Indra, the Thunderer, god of the storm, who drives his noisy chariot across the sky, and hurls his missile lightning at the demons that are keeping the refreshing and fertilizing waters imprisoned in the hollow of the clouds. Hymns to Agni, then, come first; those to Indra follow; and after them, those to other gods. As specimens, accordingly, of the general content of the Rig-Veda, we cannot do better than to take first a hymn to each of these two divinities. Such are given below, in a version that is very literal, neither adding nor omitting anything, and in meters closely imitated after the original.

The hymn to Agni, an ordinary and undistinguished one, is the first of the whole collection; its stanzas are composed each of three eight-syllabled sections, with iambic cadence: in all the Vedic meters, the first part of each section is of very free construction as regards quantity.

TO AGNI — Rig-Veda I. 1.

1. Agni I praise, the household priest,
the heavenly lord of sacrifice,
The offerer most bounteous.
2. Agni by bards of olden time
and bards of our day should be praised;
He shall bring hither all the gods.
3. By Agni treasure may we win,
and welfare, too, from day to day,
In honor-rich and num'rous sons.

4. Agni! what sacred off'ring thou
dost shield from harm on every side,
That surely cometh to the gods.
5. May Agni, priest, with insight filled,
faithful, of fame most glorious,
Come hither with the other gods.
6. What favor on thy worshiper,
Agni, thou wilt bestow,
That faileth not, O Angiras!
7. Unto thee, Agni, day by day,
at morn and eve, with worship we
Approach and our obeisance bring.
8. Presiding o'er the sacrifice,
the shining guardian of the right,
Increasing in thine own abode.
9. As father to his son do thou,
Agni, be gracious unto us;
And for our welfare cleave to us.

The selected hymn to Indra is a more than usually vigorous one, and the jealousy of a rival worshiper intimated in the concluding verse is rather interestingly naïve. The verse-sections are of twelve syllables, also with iambic cadence.

TO INDRA — Rig-Veda X. 38.

1. To us, O Indra, in this conflict glorious,
The toilful din of war, be helpful, that we win;
Where in the foray, mid bold warriors ring-adorned,
The arrows fly hither and thither in the strife.
2. And open to us, Indra, in our own abode,
Wealth rich in food, flowing with kine, and full of fame.
Be we thine allies when thou conqu'rest, mighty one!
Just what we wish do thou, our friend, perform for us.
3. The godless man, of Aryan or of barb'rous race,
O much praised Indra, that is plotting war with us—
Thy foes shall be easy for us to overcome;
Along with thee may we subdue them in the fight.
4. Him who must be by handful or by host invoked,
Him who makes room when the ranks close in deadly strife,
That famous hero, Indra, who in battle wins,
Will we to-day bring for our succor hitherward.
5. Sure I have heard them call thee, Indra, full of might,
And never yielding, urging on the faint, thou bull!
Now rid thyself of Kutsa, hither come to us!
Should one like thee sit as if fast bound by the loins?

A further example of the staple invocations to the gods is the following to the Dawn. To this goddess are addressed a number of hymns, some of which are among the finest and most poetical in the Veda (the best of them are too long to give here). The meter of the hymn is a double stanza, made up of eight-syllabled and twelve-syllabled sections.

TO THE DAWN — Rig-Veda VII. 81.

1. We gaze upon her as she comes,
the shining daughter of the sky;
The mighty darkness she uncovers, that we see;
And light she makes, the pleasant one.
2. Along with her, the sun is pouring down his rays,
rising, the planet glorious;
At thy forth-shining, beauteous Dawn, and at the sun's,
May we enjoy whate'er is ours.
3. To greet thee, daughter of the sky,
have we, O Dawn, awaked betimes;
Who bringest full and longed-for pleasure, lovely one,
As treasure for the worshiper.
4. Who shining, great and lovely one, with lib'ral rays
makest the sky appear to sight—
Of thee thus sharers in the treasure would we be;
Be thou our mother, we thy sons.
5. Bring us that wonderful success,
O Dawn, that is most famed abroad;
What food for men thou hast, O daughter of the sky,
That give to us, that we enjoy.
6. Undying fame and welfare give the offerers;
to us, possessions rich in kine;
Inciter of the gen'rous, full of pleasantness,
The Dawn shall gleam away our foes.

The next hymn to be quoted is of a very different character. It is one of those (perhaps a dozen in number in the Veda) that show the earliest signs of a dramatic faculty in the Hindu mind, and give no uncertain promise of that dramatic literature which later becomes one of its most notable products. There is a historical legend that the saint Viçvâmitra, as chief priest of the Bharatas, assured the success of a warlike expedition on the part of the latter, by propitiating with his songs and praises two of the great branches of the Indus, the modern Beas and Sutlej, near their junction, and thus securing for his friends a safe and speedy passage. The poet conceives the incident in the form of a dialogue between the saint and the two rivers. The meter is in eleven-syllabled sections, with trochaic cadence—the favorite Rig-Veda stanza.

VIÇVÂMITRA AND THE RIVERS — Rig-Veda III. 33.

VIÇVÂMITRA.

1. Eager, from out the bosom of the mountains,
A pair of coursers like, let loose and running,
Like two bright mother-kine their offspring fondling,
Vipâç and Çutudrî haste with their waters.
2. By Indra sent, longing for rapid movement,
Like chariot wheels ye roll toward the ocean;
And piling, as ye meet, your waves together,
Each one of you the other joins, ye bright ones.
3. I've come to this most mother-like of rivers;
We stand beside the broad, auspicious Vipâç;
Like mother-kine fondling their calves together,
Unto a common home they're moving onward.

THE RIVERS.

4. Thus move we onward, swelling with our waters,
To find a home that's by the gods appointed;
Our headlong forward rush no man can hinder;
What seeks the sage, calling upon us rivers?

VIÇVÂMITRA.

5. Rest, sacred ones, a moment in your courses,
And list the pleasant words that I address you!
I, son of Kuçika, your favor seeking,
Have called upon your stream in deep devotion.

THE RIVERS.

6. Indra dug out our bed, the lightning-bearer;
Vritra he slew, the hind'rer of the rivers;
God Savitar, of beauteous hands, us guided;
Impelled by him we move along so broadly.

VIÇVÂMITRA.

7. Praised be for evermore that deed heroic—
Indra's achievement, that he crushed the dragon;
He with his thunderbolt smote the obstructers;
And forth, an exit seeking, gushed the waters.

THE RIVERS.

8. Do not forget this praise of thine, O singer!
Let thy words echo on to after ages!
And compliment us, poet, in thy verses;
Degrade us not, hail to thee, mongst the nations.

VIÇVÂMITRA.

9. Now listen to the poet's words, ye sisters!
He comes from far, with chariot and with wagon;
Bow down yourselves! be easy to pass over!
And with your waves, O streams, touch not our axles!

THE RIVERS.

10. Unto thy words, O poet, will we listen;
Thou com'st from far with chariot and with wagon;
I'll bow to thee, ev'n as a buxom woman;
As maid to lover, I'll be gracious to thee.

VIÇVÂMITRA.

11. When once the Bharatas have passed across thee,
The raiding troop, sent forth and helped by Indra,
Then shall begin again thine onward torrent;
I crave the favor of the sacred rivers.

12. The raiding Bharatas have all gone over;
The sage hath won the favor of the rivers.
Now swell aloft your fertilizing waters!
Make all your courses full; flow on with swiftness!

The only hymn which will be further given here is yet more exceptional in its character; in fact, there is nothing else like it in the collection: it is rather in the tone and spirit of the Upanishads than of the Veda. Its author sets aside the old simple faith of his race, rejects the gods as after all but a part of the existent order of things, and questions his own intuitions as to how the universe came into being; with not more than the usual success. The hymn must be a comparatively late

one; it has been oftener translated than almost any other, being a special favorite with those who have a predilection for the mode of interrogating nature which it illustrates. The measure is as in the preceding hymn.

COSMOGONIC HYMN — Rig-Veda X. 129.

1. Th' existent was not, nor the non-existent,
Nor space of air, nor firmament beyond it.
What covered? where? and under whose protection?
What were the ocean's fathomless abysses?
2. Not death, nor what is deathless, then existed;
Between the night and day was no distinction;
Breathed, without wind, by inner power, It only;
Other than it was nothing else in being.
3. At first was darkness, hidden all by darkness;
This universe an undistinguished ocean;
The void that with the emptiness was covered,
That alone came to life by might of fervor.
4. In the beginning came desire upon it,
Which was of mind the earliest seed. The sages,
Seeking it, found within the heart, by wisdom,
The bond of being in the non-existent.
5. And crosswise was the ray of them extended;
Was it, forsooth, below? or was it upward?
Impregnators and greatnesses existed;
Below, oblation; offering beyond it.
6. Who truly knoweth? who can here proclaim it?
Whence hither born, whence cometh this creation?
Hitherward are the gods from its creating;
Who knoweth, then, from whence it came to being?
7. This creation — from whence it came to being,
Whether it made itself, or whether not —
Who is its overseer in highest heaven,
He surely knoweth: or if he does not know?

The history of the great collection thus instanced we are left to find out by inference from its character. In a general way, it seems clear enough. These sacred songs are a product of the joint devotional and poetic feeling of a certain early period in the history of India; after an interval of oral tradition at large among the people, they were assembled and arranged by pious hands, at what time and under what circumstances we can only conjecture, and were committed in their completeness and order to the further care of tradition — whether already with the help of writing is an obscure and disputed point. It was plainly a historical collection, made for the due preservation of a valued treasure; not a liturgical one, for use in the ceremonial of the sacrifice; the motives that led to it were literary rather than priestly. This distinction will be made clearer by noticing the character of some of the other Vedas. The Sâma-Veda consists of a limited number (less than one thousand six hundred) of selected stanzas, single or in (usually) triplets, arranged for chanting at the Soma-sacrifices, at which the

preparation and enjoyment of an intoxicating drink called *soma* was the principal feature — like a set of selections made from our own Scriptures for similar musical use in the services of the church. There are but few verses in the Sâma-Veda which do not also appear, in their proper connection, among the hymns of the Rig-Veda. The Yajur-Veda, again, is still more obviously liturgical; it is simply a record of whatever is uttered by the chief class of priests in connection with the ceremonies of the various sacrifices, set down in its order as uttered; hence made up of single words, phrases, paragraphs, in prose; and single verses, extracts, and whole hymns, in verse; disjointed and in great measure wholly unintelligible till we know the ceremonial act which they were intended to accompany. It will illustrate this, and at the same time show the immense and closely defined detail into which the sacrificial ceremony was carried at the period of the Yajur-Veda, if we notice its first sentences and their use.

An important material of offering in ancient India was milk, or the various products of milk, especially clarified butter. He that has a sacrifice in prospect, then, must provide for it by milking cows, expressly for the purpose. Accordingly he is directed to go out and cut a switch from a tree of a certain prescribed kind, saying to it, "Thee for food, thee for strength." With this switch he is to drive away the calves from his milch cows, with the words, "Winds are ye," and then to address to the cows themselves this verse:

"Fill up, ye sacred ones, the draught for Indra,
Rich in increase, safe against harm and trouble;
Let no thief master you, and no ill-wisher;
Stay fast by this your owner, and be num'rous."

Next he puts the switch away in hiding, and enjoins upon it, as a sacred weapon, "Protect thou the cattle of the sacrificer!" And what he has thus said, in mingled prose and verse, to the switch, the calves, and their mothers, constitutes the first paragraph of the Yajur-Veda. There are, as might be expected, varying versions of this Veda, according to the different usages in the ceremonial of different localities and priestly schools; and half a dozen such versions, with their attendant literatures, have come down to us.

Now a verse put in order for chanting at the Soma-sacrifice is called a *sâman*; and a verse or other utterance used by the officiating priest at a sacrifice is called a *yajus*; hence the texts in which those are respectively gathered are called Sâma-Veda and Yajur-Veda, and they are liturgical collections; while a verse pure and simple is styled a *ric*, and the comprehensive and orderly collection

in which these verses are assembled, without reference to their sacrificial use, is the Rig-Veda — a name that is fully intelligible only in its antithesis to the other two. It is clear, then, why the Rig-Veda is of an importance to us that throws the others quite into the shade; it offers in mass and in order what they give in part and in fragments. Not all the verses, to be sure, of the other two are found also in the Rig-Veda; nor are the versions of the same verse always alike in all the three. Hence we infer with confidence that the Rig-Veda was not collected first and the others extracted from it, but that all alike proceeded from a common stock of traditionary material; the two made for a practical purpose, the other for one that may in comparison be called a literary purpose. The fourth Veda, the Atharvan, is a historical collection, like the Rig-Veda; it is about two-thirds as extensive, and contains only in small part corresponding material, and that akin especially with the tenth or supplementary book of the other: one more selection out of the traditionary material, but composed of hymns of later date and lower character, more popular and superstitious.

It is not worth while to attempt to describe in detail the means by which this great mass of literature has been handed down to our time. But it has been mainly by living tradition, from the mouth of the teacher to the ear of the scholar. The schools of the Brahman priesthood, though long decadent, are not yet extinct. There is not one of the Vedic texts which has not still in India its personal representatives, men who, without ever having seen a manuscript of it, can repeat it from beginning to end, with all its tones and accents, and not losing a syllable, with the mechanical accuracy of the impressed foil of a phonograph — sometimes also with an intelligence not much greater. The old books are full of prescriptions as to the schooling of the young Brahman, by which he in his turn is made a link in the never-ending chain of personal tradition. To write the Veda, or to acquire it otherwise than by reverent listening to the living teacher, is everywhere denounced as sacrilege. There are, nevertheless, manuscripts, and we who cannot spend a dozen years of memorizing at the feet of a Hindu sage are obliged to depend upon them; but where in the line of tradition written record comes in, or what part it has played in the work, we cannot tell: it is utterly ignored in theory. There are no manuscripts in India that compare for antiquity with our oldest classical and biblical codices; the hot, damp climate and the all-devouring insects prevent that; and Hindu scribes are even more ignorant and careless than those of other na-

tions, and quite deficient in reverence for the integrity of a text or the individuality of an author; so that, if written record and personal memory did not supplement one another, our chance for receiving a faithful version of those old hymns would have been of the smallest. As things are, however, the accuracy of their transmission is unparalleled; we have the best reason to believe that of the leading texts not a word has been lost nor a syllable changed since some time before the Christian era, at any rate. The ingenuity of the means adopted, and their successful result, constitute one of the marvels of universal literary history. Circumstances have strangely worked together to bring it about that this least historical of all peoples has saved the historical records of its earliest period with a fullness and accuracy unrivaled even in annal-loving China or all-preserving Egypt. It is to the belief in their absolute verbal inspiration, and their efficacy, when rightly applied, as the means of salvation, and then to their custody by a priestly caste, the Brahmans, whose importance depended on their possession and use, that their transmission to us is due.

We must not think of the Veda as occupying for the Hindu a place at all analogous with that taken by the Bible in a Protestant community — as familiarly known, in whole or by extracts, to the mass of believers in its sanctity; as used to reveal to them the dealings of the gods with men; as a scripture to be resorted to when enlightenment of conscience was sought and expansion of religious sentiment yearned after. The Veda has long had its value in India in connection with the ceremonies of sacrifice, which are inefficacious without it. An illustration has already been given of the infinite and absurd detail into which, in the hands of the Brahman priests, the Vedic ceremonial was carried: a detail contrasting strangely with the simplicity of worship of the original hymn-makers. While the hymns have been saved, and are still intoned in the Brahman schools in the style of two or three thousand years ago, and while the religious services they accompany are faithful copies from the same period, a great revolution in real belief, in the outward circumstances of the people and in the organization of their society, has taken place. And it is this great cleft between later Hindu faiths and institutions and those reflected in the Vedic hymns that gives the latter their supreme interest. They seem to belong as much to our own ancestors as to those of the modern inhabitant of India. This is the point that we have especially to dwell upon.

Our ideal Hindu, when we call up his image before our mind's eye, is a member of a strictly defined caste, dreading pollution from even

the shadow of a man of lower caste falling on him. We see him strolling along the banks of the holy Ganges, or perhaps riding there upon an equally contemplative elephant, meditating on the ineffable perfections of Brahma and the nothingness of all things sublunary; contemning the bonds of finite and personal existence that oppress him, dreading the round of successive births, from man to animal and back again, to which he regards himself as condemned, and devising how by self-inflicted torments or by the attainment of better insight he can escape this condemnation, cast off his individuality, and merge himself like a drop in the ocean of the universal World-soul. But the Hindu of the Veda is not in the least like this languishing and hair-splitting dreamer. He is instead an immigrant, laying about him lustily amid the difficulties of a new country, and trying to win a comfortable subsistence in it. He is just across the threshold of India, in the country of the Indus and its tributaries (in the map given above, this region is pointed out by being dotted); these are his holy rivers; the Ganges he hardly knows as yet; it is mentioned only once in the Rig-Veda, being called upon to join with other rivers in doing homage to the great Indus. The elephant he has seen; he calls it "the beast with a hand," and celebrates its devastating might, which he has not thought of subduing to his own service. He is a member of a homogeneous community, and has had no special duties assigned him in any caste-division of labor. He is a cultivator, and does, with the help of stout sons and retainers, his own plowing and reaping; but he is also a man of war, and does his own fighting; and he can offer his own praise and worship to his gods, without the help of a priest. A god Brahma is wholly unknown to him, and Çiva no less; and Vishnu is merely one of the names under which he pays his adoration to the sun. The word *brahman*, the cardinal one in both the religious and the civil development of later India, is indeed Vedic; but it simply means on the one hand "worship, an act of worship," and on the other hand (with a difference of accent and gender) "one who pays worship, a worshiper." The gods of the Veda are the personified powers of Nature; beings to whom — with that anthropomorphism which is the informing principle of all primitive religions, and cannot be cast out even from the latest, so deep-wrought is it in the very structure of the human mind — the ancient Hindu attributed the acts and effects which he saw in the world about him. They are the shining sun, the radiant dawn, the encompassing heaven, the fruitful earth, the storm-blasts and gentle breezes, the wielder of the thunderbolt, and

the devouring yet kindly fire,—these and their like. To them (as we have seen in the examples given) he addresses his praises, partly in simple admiration of their greatness, but chiefly because he would fain win their favor and aid in his struggle for existence. Instead of the morbid introspection and pessimism of his successors, he is animated by a healthy and vigorous worldly-mindedness; he loves life and the good things of life; he prays for length of days, from exemption from all disease save old age—"let me live a hundred autumns" is the constant burden of his supplication; he prays for numerous sons, for countless flocks and herds, for abundant food, for wide domains, for superiority over his fellows; he prays for victory in his strife with the aboriginal tribes whom he is trying to rob of their inheritance in the land—the black-skinned godless races, the *śûdras*, whom later we find taken into his social system as the fourth and lowest or menial caste; for victory, also, in his contention with his fellow-Aryans, in his plundering raids after cattle, the special sign of wealth. About what shall happen to him after death, he thinks and says little; but that little is enough to show what his faith is. He does not believe that life ends with the death of the body; still less has he the remotest notion of an existence renewed by further births, either as human being or as lower animal; no preparatory hint, even, of the doctrine of transmigration is to be found in the Veda. He holds that the departed will be assembled again, in a world beyond the grave, under the dominion of the divinely born progenitor of the race, to be forever happy there with him; and he piously offers to his ancestors a monthly oblation, which he thinks will accrue to their benefit in that other world.

Such are the salient traits of the Vedic Hindu; and it is at once seen what a marked contrast he presents to the Hindu of the later period, what an air of comparative freshness and primitiveness he wears. It can easily be imagined, too, with what astonished interest the discovery was made. This, then, was what the Vedas after all contained: not treasures of primeval wisdom, not profound speculations as to the nature and relations of divinity and humanity, not reconciliations of fate and free will, or solutions of the problem of evil, but the lyric records of a congeries of free tribes, fighting, winning property, enjoying life, and calling on their gods to help them in it all! Yet out of this state of things have grown by a process of natural development under the guidance of circumstances (not by any influence from without) all the conditions of more modern India. The steps of transition are to be seen in part in the later portions of the Ve-

dic literature that have attached themselves to the hymns; but they are far less completely depicted than is the Vedic period itself. We see there the priestly class consolidating itself into a hereditary Brahmanic caste, grasping all power in sacred things and the leading influence in things secular, working the sacrifice out into a ceremonial of inane intricacy, and at the same time beginning those speculations which became later the systems of theosophy and philosophy, and by degrees shoved the ceremonial aside into a secondary position, apart from the real religious and intellectual life even of the learned. The interminable disquisition of the Brâhmanas (the second class of Vedic texts) leads over to the Sûtras or rules of sacrifice, the Law-books, or rules of conduct in life, and the Upanishads, or treatises of speculative theosophy. These are the chief lines of connection between the secondary Vedic literature and the later or classical Sanskrit literature; but the real spirit of the earliest Veda is alike wanting in both divisions.

Herein lies a part of the value of the Veda. Everywhere in the world the authentic materials of ancient history are so lamentably scanty! We know, except by (perhaps mistaken) inference, so little of the primitive conditions lying behind the great civilizations that the world has produced! Races in general are what they always have been, or else (like our own) they have gotten a civilization at second or third or fourth hand, mere continuers and perhaps improvers of a culture elsewhere developed; and of the communities that have generated civilizations, hardly any let us see its beginnings. The Egyptians, oldest of all, are at the furthest limit of their traceable history already a made community, their arts and knowledge virtually the same as through after ages. The Chinese, at the dawn of their national life (2000 B. C. or earlier), are an empire, and the same odd, sensible, matter-of-fact, wise, ingenious, industrious, ceremonious, stiff people that they have ever since been. It is only in India that we can trace in contemporary documents not a little of the growth of great empires, highly specialized institutions, great literatures, systems of religious belief that have affected half the population of the globe; out of the conditions of a band of pastoral immigrants into a new country. That the institutions of earliest India as seen in the Veda should have developed into those of the India of ordinary history is a fact that has profoundly impressed all investigations into the history of mankind; and it involves problems which will continue to furnish occupation for generations of special scholars.

What period in actual chronologic time is represented by the Vedic hymns is a question

of considerable, though after all only of secondary, interest; and it cannot be answered otherwise than in a rudely approximative way. This is nothing unusual. There are centuries of possibilities involved, for example, in the question as to the age of the poems of Homer—much more, of the Zoroastrian writings. Even of the books of the Bible, which we have long comfortably thought datable almost to a year, the age, and the order of succession in age, have now become subjects of the liveliest controversy; and in India, where the historic sense has always been conspicuously wanting, the case could not but be the worst of all. We have only the most general grounds to build our conclusions upon. Let us briefly review the more important of them. There is in the first place the language. Here the most notable fixed datum from which we have to reason back is the age of certain Buddhist inscriptions found in various parts of India, the work of one pious monarch, who chose this way to inculcate the teachings of the religion he professed. It happens by great good fortune that the period of this monarch is pretty precisely known, by information from western kingdoms with which India came in contact; it was about 250 B. C. But the inscriptions are not Sanskrit; they are in a later dialect, related to Sanskrit much as Italian is related to Latin. Hence we know that Sanskrit was extinct as a vernacular at least three centuries before our era. And the language of the Veda is an older and more primitive dialect, whose period must have long preceded that protracted period during which the Sanskrit itself held sway. More distinct are the yet more external historical circumstances. When Alexander attacked the western border of the country, its interior, the basin of the Ganges, was the seat of great kingdoms; and in his battles with Darius he had been opposed by Indian elephants trained to do warlike service; while, as has been already pointed out, the Vedic Hindus kept their herds in the valley of the Indus and its tributaries, and knew the elephant only as a formidable wild beast. Again, Buddhism is believed to have originated in the fifth century B. C. (the date being liable to its own degree of uncertainty); but Buddhism involved a reaction against the excessive burdens of sacrificial ceremony and of caste which resulted from the complete development of Brahmanic religion and polity out of the early freedom of the Veda; and it implies as its necessary basis the universal belief in transmigration, all intimation of which is so wanting in the Veda that the student of India can hardly see how it arose and where it came in. Then there is the succession of the Vedic writings themselves, with the time nec-

essarily assumable for the development of each class; but this kind of evidence is even more indefinite than the rest. Astronomy has been sometimes appealed to, but with an entire absence of valuable result. The probable conclusion from all this is, that the epoch of the Veda must be fixed at considerably more than a thousand years before Christ; indeed, it does not seem as if much less than two thousand would satisfy the conditions of the problem: more than this no moderate scholar would at present claim. It is, of course, not altogether impossible that future researches may bring us to a date somewhat less indefinite.

But the time thus provisionally reached is a whole thousand years older than the most ancient literature found elsewhere among the races of our kindred: namely, the Greek epics of Homer. This is one of the leading claims of the Veda to our attention; it contains by far the oldest records of the thought and speech of our division of mankind; coming, too, from that lyric period which has always been assumed to have preceded the epic, but is nowhere else demonstrated by examples. It may be added that in the Brâhmanas, the extensive expository texts next following the hymns, we have the earliest specimens of Indo-European prose; and they have been made to illustrate interestingly the laws of that primitive homely talk out of which grew in after times the graceful or stately periodic style of a Plato or a Cicero. Along with antiquity of the records, too, goes antiquity of the tongue in which they are written. As the age and primitiveness of the Sanskrit give it the first rank in all inquiries into the earliest history of our languages, so the Vedic dialect of the Sanskrit has something of the same superiority over the classical, as an aid to historic philology.

More conspicuous, however, at the present time, and, if possible, even of a wider interest, is the contribution made by the Veda to the comparative history of Indo-European institutions, and especially of religious institutions, of beliefs and myths and modes of worship. We have seen how un-Indian the Veda is in all these respects; and we find it to be in the same degree Indo-European. The *rationale* of this is simple, and statable in brief form. Every community of mankind, of whatever degree of culture, has its philosophy of the universe, its own view, the outcome of experience and unconscious deduction from observation, of how things are carried on in the world. This may be very scanty, very indefinite, very naïve, or even worse than that; but it is always there; and each new generation learns and holds the views of its predecessor, adding

to them, for the worse or for the better, out of its own experience and insight. The religions of the world in general are outgrowths of these philosophies, propitiatory praise and worship and offering and prayer addressed to those extra-human (for one can hardly call them always superhuman) beings who are believed to direct with unseen hands the course of Nature, determining the welfare or ill-fare of men by means that men cannot wield. There is no such thing as a race without some kind of a philosophy and a religion. Now if we find in language (which is itself but another institution, formed and handed down in the same way) evidence that the ancestors of certain races once lived together as a single community, speaking a common dialect, we know that they must have had also a common faith and worship. It follows, then, that the ancestors of all those races in Europe and Asia which we call Indo-European once had the same myths, and worshiped the same gods by the same rites. And just as we look into and compare their dialects, ancient and modern, and try to reconstruct the original speech out of which they all sprang, so we strive, by a comparison of their oldest traceable beliefs, to find what was the original form of these in the day of their unity. The search is a difficult one, and full of risks of error; for doctrines are elusive things as compared even with words, much harder to deal with objectively and without perversion; and also because religions are more mutable institutions than languages, more liable to mixtures and revolutions and transfers from one race to another. The conversion of Vedic Hinduism to the later Brahmanism wiped out or buried beyond recovery all that was primitive in Indian beliefs; and on Iranian ground, perhaps not much later than the Vedic period, the reformation of Zoroaster swept away the old Indo-European polytheism, and put an almost pure monotheism in its place. There is, it may be remarked, no known monotheism that has not thus grown out of a preceding polytheism; nor is it in sound theory conceivable that there should be one not having such a predecessor and foundation. But no wholesale and effacing change had passed upon the creed of our division of mankind in its gradual transition to that of the Vedic Hindus; in the latter there is more that is in common with the fundamental features of earliest Greek and Roman and Germanic faiths than with its own successor in India. Hence, precisely as the Vedic language, used as additional and

leading term in the comparison, casts light on the origin and relations of Greek and Latin and German, so the Vedic divinities, the Vedic myths, the Vedic religious practices, cast invaluable light upon all the religions which preceded the introduction of Christianity into Europe. As the study of Sanskrit effectively inaugurated the science of comparative philology, so the study of Vedism inaugurated the science (if we may call it so) of the world's religions.

To show in any satisfactory manner by examples how this is so would require a whole article to itself. There has been and is in the discussion of the subject (as always in such cases) a plenty of exaggeration, of groundless identification, overweening inference, airy speculation, gratuitous system-making; but the main fact stands fast, that if we would understand the language and the religion of our own earliest traceable ancestors, we must study the Hindu Veda. As a historical document, spreading light amid the darkness of antiquity, it stands well-nigh unrivaled.

This, then, is the position of the Veda, and these are its claims to attention from us. We are not called upon to admire it for its contributions directly to the stores of human thought, but rather to the material for us to think upon; nor is it to be ranked as a literary production among the masterpieces of the race, to be dwelt upon and enjoyed with that sort of admiration that we pay, for example, to the *Iliad*. The Veda is rather a book for scholars to dig in. There are things in it that are absolutely fine; but they need much selecting, and setting in the proper light, and explaining. And the great mass is very tedious. The endless repetition of the commonplaces of praise to the gods palls upon one. It takes more imagination and genius than belonged to that sturdy race of fighters and singers to spread the adoration of Agni, for example, through some hundreds of hymns and not make it seem very thin. Add to this that hymn-making appears to have become the fashion in that period, and that there is in the Rig-Veda (much less in the Atharvan) a considerable amount of what may fairly be styled machine-poetry, industriously pieced together out of stock epithets and phrases, or running off into labored obscurity and artificial conceits. No complete version of the Veda will ever become an accepted book in our general libraries; but a selection of a hundred hymns or two, with fit comment, might not fail to find an interested public.

W. D. Whitney.

THE MARGIN OF PROFITS.

THE true income of the people of the United States consists of the products of its fields, forests, factories, workshops, and mines; these several products are exchanged, and in the process of exchange they are, of necessity, measured in terms of money. The larger part of these products is consumed in the process of production; the smaller remainder is saved and is converted into capital. In the course of this process of production, consumption, and reproduction, the fibers, food, fabrics, and metals are subdivided into shares; and these shares, when converted into terms of money, have been named, respectively, rents and profits (which merge into each other), wages or earnings, and national or municipal taxes.

The practical question which now calls for close analysis is this: *What is the actual margin of profits?* In other words, are capital and capitalists securing to their own use such an undue share of the joint product of labor and capital as to render a change in existing methods of distribution either necessary or expedient?

In any discussion of the subdivision of the national income into the respective shares of rents or profits, wages or earnings, and national or municipal taxes, it is important to separate profits into two classes, which may be distinguished in popular language as

1st. The profits of productive industry, or those which are derived from the use of that capital which has been already invested for productive purposes; and

2d. The profits which are derived from speculation, or from dealing in something which has already become capital, and which is dealt in as such.

For example, in order that a factory of any kind may be established, an investment of capital is required in buildings and machinery. The factory is completed; labor is then employed in it; the result is a product of some kind, which is the joint product of the capital in the factory and of the labor employed therein, from the sale of which both profits and wages must be derived, or else the industry will cease. But the factory itself may belong to a corporation whose stock is divided into shares, and there may then be a distinct profit in buying and selling these shares, or,

in common speech, in *speculating* in the stock of the factory.

It will be observed that there are not only two, but three distinct sources of possible profit in connection with this factory: 1st, a possible profit may be derived from dealing with the capital, either as a whole or when it is divided in shares in a corporation; 2d, a profit may be derived from the production of goods in the factory; 3d, a profit may be derived from dealing in the goods after the owners of the factory have sold them.

In respect to the profit which is derived from the manufacture of the goods in the factory, the workmen may be said to have a joint interest with the capitalist.

Let it be assumed that in such a factory one thousand dollars' worth of capital is required to be invested in the building, machinery, and stock in process for each workman employed therein, and that the joint product of the capital in the factory and of the labor employed therein will be worth in the market each year one thousand dollars. This is about the present average ratio of capital to product in a cotton factory making medium goods.

Let it be assumed that the materials which are to be used, and the other elements of cost, aside from wages, will come to six hundred dollars. There will then remain four hundred dollars, derived from the sale of the product, to be divided in the form of profits and wages.

At the present time any safe business will attract all the capital required in it, which will yield six per cent. net profit, and also four per cent. for such a sinking fund or reserve as is necessary for the repairs and maintenance of the capital, or for the purchase of new and improved machinery as fast as invention may destroy the value of the old. Any such safe industry will surely be taken up in this eastern part of the country, and the investment of the necessary capital will be made as fast as a market can be found for the sale of the goods.

This would call for sixty dollars a year to be set aside as profits out of the four hundred assigned to profits and wages; four per cent., or forty dollars, as the sinking fund necessary for the maintenance of capital in an effective condition; and there would remain above the cost of materials and other prior charges, three hundred dollars to be paid as wages to the operatives in the factory, which sum would be substantially the wages of a good adult female weaver at the present time.

In such a case capital would secure sixty dollars net income, and labor would secure three hundred dollars wages, or five to one. This is an extreme case. In most branches of manufacturing industry the ratio of capital to the value of the product is only one dollar's worth of capital to two dollars' worth of product in a year.

At this latter ratio of one thousand dollars' worth of capital to two thousand dollars' worth of product, the income of capital at six per cent. would be sixty dollars as before, the reserve forty dollars, and there would remain nineteen hundred dollars for the cost of materials and the wages of labor. In most cases labor secures nine or ten parts to one part secured by capital.

There are, of course, other subdivisions to be made of the sum received from the sale of goods besides cost of materials, wages, and profits. Taxes, insurance, and the cost of disposing of the product must be provided for out of the market price or gross value of the goods made; but, for the purpose of this consideration, the subdivision of the sale of the goods under the head of, 1st, cost of materials, insurance, taxes, and general expenses combined; 2d, sinking fund, or reserve for repairs and maintenance of capital; 3d, profits, and 4th, wages, will serve to make the distinction clear in respect to what is the margin of profit upon production.

It will be observed that both profits and wages alike depend upon the price at which the goods can be sold; this price is determined in the open market, and cannot be controlled either by the owner of the mill or by the workmen who are employed in it.

This factor, the price of the goods, is therefore what makes or determines the rate of wages as well as the rate of profits; but the wages must be paid, even if there is sometimes no profit, unless the work ceases wholly.

So much for the profits of productive industry. Now, on the other hand, there may be a profit to persons who deal in the stock in this factory. The price of the shares will fluctuate, and he who buys judiciously on a falling market and sells promptly on a rising market may make a profit; but this so-called speculative profit will have no direct relation to the profit made in the production of the goods by the mill itself, although it may be influenced by it; neither has this profit of the so-called dealer or speculator in the shares any directly adverse or beneficial effect upon the workmen in the factory.

This distinction is of universal application. The workman may share with the capitalist in the results of all production, but the workman may not share with other capitalists either

in the risk, danger, or profit of dealing in the shares representing the capital invested, unless he himself becomes a capitalist to the extent of becoming owner of a part of the property or of such shares.

In a money point of view, it really matters nothing to the workman who it may be that owns the stock in the factory in which he is employed, provided the ownership of the factory falls into the hands of persons who possess capital, credit, and skill adequate to its profitable operation.

These factors of capacity and skill in the use of capital are as necessary to the workman as the use of the capital itself. How many workmen are there who could manage the mill? Is not the captain as necessary in the army of industry as the officer in the army of soldiers?

The majority of the stock in a factory might be owned by the temporary inmates of a State's prison; this fact would not affect the wages of the workmen in the factory, provided the credit of the corporation did not suffer, and provided the manufacturing agent were competent in its direction. The quality of the fabrics may be good even if the producer be a knave.

In the long run, the best goods pay the best profit, whoever makes them—just as the best workman secures the highest wages, for the very reason that he can make the best fabrics at the lowest cost. An astute knave will act upon this rule as surely as an honest man.

There can be no strikes of labor or laborers against capital or capitalists in the matter of speculation. All attempts to interfere by way of legislation with the processes of trade and with the practice of buying property of any kind in anticipation of a rise, either shares of stock, farm products, or manufactured goods, or even with buying and selling on contract without either party being in possession of the property, have proved entirely futile; but as these dealings only affect the disposition or distribution of capital already saved and in existence, they are of little direct consequence to laborers or working people, considered as a separate class.

Discontent exists and strikes occur mainly in productive industries, the common impression of many workmen being that capital, simply as capital, or that capitalists or owners, by means of the use of their capital, obtain an undue and inequitable share of the joint product of capital and labor, and thereby deprive the workman of something which ought to belong to him.

It is, therefore, important to determine what are the facts in this department. This

can only be done by selecting certain kinds of employment, and by ascertaining what the value of the product is, and thereby determining the method and proportion of the distribution of the money which is received from the sale of such fabrics which can be devoted either to profit or to wages, after materials and other charges have been paid for.

Given a certain sum derived from the sale of goods, there are certain charges to be met, as heretofore stated.

First, it will be admitted by both parties — capitalists and laborers alike — that property in the factory should be insured against loss by fire, and this must be paid for.

Second, that taxes must be paid upon it, be they greater or less.

Third, that competent men must be employed to oversee and direct the actual work, and these men must be paid.

It will be admitted that a certain part of the proceeds of the sales of the goods made must be set aside to meet these expenditures; also, that materials must be purchased; and also, that freights must be paid for moving the material to the factory, and the goods from the factory.

It will also be admitted that, in some way or other, the goods must be disposed of, and that certain expenses must be incurred in making such sales; a reserve must also be set aside to meet losses by bad debts.

It will, however, obviously be for the interest of the capitalist to reduce all these charges to the lowest possible point consistent with safety and with the conduct of the business; and to this extent at least the interests of the capitalist and of the laborer or workman are absolutely identical. Capital must, however, take all the risk not only of the fluctuation in the prices of materials, but of the goods manufactured, while the workman must be paid whether there is any profit or not, unless the mill is stopped. The mill is a fixture; it cannot be moved away; while the laborer who is dissatisfied with the work in it can move where he pleases and can choose other work, according to his or her capacity.

There is no greater fallacy than the common assumption that capital can move more readily than labor; once invested, it becomes a fixture and is at the mercy of circumstances.

The writer has known mills to be stopped by the bankruptcy of the owners followed by litigation among the creditors, which kept them idle only for a few years; but when finally disposed of, they could not be started again without such replacement of new for old machinery, and such reconstruction of buildings, that in some cases it would have been better to burn them than to remodel them.

When mills or works are in full operation,

after all these various prior charges have been defrayed from the proceeds of the sales of the product, there will remain a certain sum of money subject to distribution; one part of which constitutes the profit of the capitalist, and the other part constitutes the wages or earnings of the workmen or workwomen.

The question between laborers and capitalists is thus narrowed down to the disposition of this particular portion of the money remaining from the sale of the goods, all other charges having first been met.

It will be admitted by all intelligent workmen, or by their representatives, that some part of this remainder must be set aside as profit for the remuneration of the owner, whoever he may be, for the mere use of his capital, or else the work will not be undertaken at all, and there will then be no wages to be derived from that occupation, whatever it may be.

No man will invest capital without an expectation of profit; what inducement, then, must the laborer give to capitalists, if he had the complete power to dictate terms?

The question, therefore, is at last, *what* proportion of that part of the joint product of labor and capital in any given art, which it is possible to set aside for the purpose, will satisfy capital and will induce the owners of capital to continue in the business and to increase it so as to meet the need of an increasing population? When the question is brought down to this narrow point, most people who are not conversant with the facts will be greatly astonished at the very small share of the sale of the goods which now suffices for the compensation of capital. This share, small as it now is, is also constantly diminishing in its ratio to product as capital becomes more and more effective; hence the advocates of coöperative manufacturing, profit-sharing, and other expedients for improving the condition of those who work for wages may perhaps find that the risk to the workman in such undertakings will far outweigh any possible gain to him, for the very reason that in almost all branches of industry the margin of profit is now so small that the workman could not afford to run any risk whatever in order to share it.

It is impossible to treat profit-sharing without considering risk-sharing or loss-sharing at the same time. There is no rule of "Heads I win, tails you lose" in legitimate commerce.

We may derive some conclusions on this point from the data of the census; but they are not wholly satisfactory, because of the tendency of the owners of manufacturing property or capital to overestimate its value. It therefore happens that, in dealing with the census returns, we may only accept the statements of the cost of materials, of the number of persons

employed, of the sum of their wages, and of the market value of the products as being very accurate — all such items being taken from the actual books of account. The returns of capital employed in the work are very wide of the mark; respondents sometimes gave the cost, sometimes an estimate, sometimes the fixed capital or investment only, and sometimes both the invested and the active or cash capital made use of in the operations of the factory.

The writer happened to be one of the special census agents for compiling the statistics of the cotton manufacture. He found that if the corrections should be made in the stated amount of capital invested or employed in all the manufacturing arts corresponding to what would have been reasonable in this branch, the capital account in general manufactures, as given in the census, would be reduced by at least twenty and perhaps twenty-five per cent.

The figures given in the cotton manufacture were as follows.

<i>Capital.</i>	<i>Persons employed.</i>	<i>Wages.</i>	<i>Product.</i>
\$208,280,346	172,544	\$42,040,510	\$192,090,110

The maximum estimate of capital invested in the number of spindles returned at that date should not have exceeded \$160,000,000 to \$180,000,000 after allowing for necessary depreciation.

In point of fact, at the present lower prices of buildings and machinery, it requires about \$1000 to be invested in an entirely new mill and machinery for each hand employed in an average plain cotton factory; and if from one-quarter to one-half of a cent a yard of medium cloth of average quality can be secured from goods now worth three to ten cents per yard, the factory will earn six to eight per cent. on its capital; labor, on the other hand, will secure one and one-fourth to three cents per yard, the rest of the price of the goods being expended for materials and charges. Both parties will thus obtain the largest profits and the highest rate of wages which the price of the goods will permit.

In the woolen mill, on common every-day goods, such as flannels and plain cassimeres, the ratio is about \$500 capital to one workman; and if the owner can secure four to six cents from each dollar's worth of product, he will make eight to ten per cent. on his capital.

In the shoe factory only \$250 to \$300 of capital invested is required to each workman, while the annual product is three to five times the value of the capital invested; therefore, if the owner can secure three to six cents a pair on shoes worth \$1.00 to \$2.00, or three per cent. of the proceeds of the sales, he will earn ten per cent. on his capital, while the wages

of skilled boot and shoe makers average \$500 to \$600 a year, and in some branches very much more, or twice, at least, the amount of capital required to set each one at work. It is for this very reason, that the capital is so small in ratio to product, that so large a proportion of the capitalists in the boot and shoe manufacture themselves began at the bench, having entitled themselves to a credit in the purchase of materials by virtue of their character and not on the basis of their capital.

In converting dirty brown sugar into refined white sugar, a very large capital is required; yet it is so small in ratio to the value of the annual product, that one-sixteenth of a cent a pound profit suffices for its remuneration.

In the calico print works and in the bleachery, if the owner can secure a profit of one-tenth of a cent a yard upon staple goods, he is well satisfied.

In the manufacture of paper, three to five per cent. on the product will yield ten per cent. or more upon the capital.

On the other hand, if the profit on staple goods is more than six per cent. on the average, and upon fancy goods — of which the price is very fluctuating and uncertain — more than ten per cent., capital will be put to use in that art very rapidly, thus creating greater competition for skilled workmen, raising wages, and reducing profits to a minimum. Upon investigating a great strike which recently occurred, the writer ascertained that had the workmen succeeded in securing to their own use the whole profit which then satisfied the owners of the capital in a fairly prosperous art, their average wages would have been increased only \$15 to \$20 on average earnings of \$500 a year.

It is curious to observe that most of the strikes in this country have occurred in branches of industry in which the average margin of profit is least, and in which, if the workmen had secured to their own use the entire sum which the existing price of the goods would permit to be assigned to profits, their own remuneration would have been very little increased. Sometimes the price of the goods is advanced in consequence of a strike, in which case the consumers pay the advanced wages if secured, and not the capitalists who own the factories. Such an advance both in prices and wages is, however, of rarest occurrence; when a strike is accompanied by such an advance in the price of the product, a temporary scarcity occurs, of which the owners of the existing stock of goods take advantage, but the workmen seldom or never get it, although consumers pay it.

If we take the census figures of the manufacturing arts in 1880, and reduce the capital

said to be invested, in the proportion by which that in the cotton manufacture should be reduced in order to make it approximate to the facts, the figures would stand as follows:

Capital invested in manufacturing as given in the census.....	\$2,790,272,606
Reduced by 20 per cent.....	558,054,521

True valuation of capital.\$2,232,218,085

In the list of manufactures, however, several branches of industry, such as flour-milling, sugar-refining, meat-packing, and the like, will be found in which the raw material is very slightly advanced in value in the process of manufacture, and in which the proportion of wages and of profits combined to the gross value is very small indeed.

If these be classed separately, the remainder, which are strictly "manufactures" in the ordinary use of the term, will be found to require about \$1000 capital to each \$2000 of product at wholesale prices; therefore five per cent. of the product of all manufactures, so-called, will, as a general rule, yield ten per cent. upon capital, leaving ninety-five per cent. to be expended for the cost of materials and other charges, and for the wages or earnings of labor.

In the census report upon manufactures the cost of the materials used is given at	\$3,396,823,549
The wages or earnings of all persons employed	947,953,795

Total.....	\$4,344,777,344
If we next assign as profit of a fraction over 5 per cent. upon the gross value as given, to wit, on \$5,365,579,191, we get a quotient of profits of.....	279,272,606
which is ten per cent. upon the capital invested, even as given in the census without reduction.	

Total.....	\$4,624,049,950
The remainder of the gross value of the product is	741,529,241

Total..... \$5,365,579,191

But it will be claimed and admitted that there has been a profit in the production of the materials used, and perhaps it will be alleged that the last item or remainder of \$741,529,241 is too large to have been absorbed by general expenses.

This last remainder of \$741,529,241 is the sum out of which insurance, taxes, general expenses, cost of transportation, loss of interest on sales made on credit, losses by bad debts, and all other necessary elements of the cost of manufacturing and distributing the goods—aside from materials and wages—must of necessity be defrayed before either wages or profits can be secured by either labor or capital.

To any one who is thoroughly conversant

with the miscellaneous expenses of the manufacturing enterprises of this country, this proportion of the gross value will not appear too large, bearing in mind that in this list of manufactures are included not only the great factories of every kind, but all the lesser articles of manufacture on which the cost of distribution is often very heavy.

In respect to the production of crude materials which are used in the manufacturing arts, less than five per cent. of the gross value will yield ten per cent. profit upon the capital which is needed for their production—the proportion of capital to the value of the product in growing or preparing such crude materials being less than in respect to the finished manufactures in which they are used.

Now, if it be true that any branch of industry which will yield ten per cent. profit on the capital required has been and will be rapidly undertaken, does it not follow that even in so prosperous a year as 1880 it is almost certain that labor secured at least ninety per cent. of the joint product of labor and capital?

In this connection I do not bring in the incidence of taxation, for the reason that, in my judgment, the tendency of all taxation, wherever and however imposed, is to diffuse itself throughout the community in the ratio of the consumption of the people. Therefore both the increment of profit and the share of labor are proportionately subject to taxation. Hence it is held that profit may be one-tenth and wages or earnings nine-tenths of the gross product, both shares being subject to taxation.

The proportion of profit upon the insurance of the factory, upon transportation, and upon the cost of wholesale distribution is also very small in ratio to the magnitude of the operations.

In the end, if such sums or percentage be assigned to profits in each department—to wit, in the primary processes of production, in the secondary processes, and even in some cases in the third processes, which are required in order to bring crude materials into form for final consumption—as will yield ten per cent. upon the capital needed in each and every department, it will appear that not exceeding ten per cent. of the final gross value of manufactures in 1880 would have sufficed for this purpose.

That is to say, the sum of all the capital necessary—1st, in the production of the crude materials used in factories; 2d, in the factories themselves, taken as a whole; 3d, in the distribution of the finished goods at wholesale—is in all probability about equal to the final wholesale annual value of the finished manufactures.

Therefore ten per cent. of the final value

will pay ten per cent. profit on all the capital used in all the departments of the work.

If more than ten per cent. is earned by capital, then new capital will be applied, and the rate of profit will be reduced to ten per cent. at most, and in all safe occupations at the present time to a much lower rate.

What becomes of the rest, it being admitted that laborers and capitalists alike yield up a portion of their respective shares by way of taxation for the support of government? Must not all the rest, of necessity, pass to those who perform the actual work in the field, in the mine, upon the railway, in the warehouse, or in the factory? If my reasoning is correct, is not all the rest *nine parts in ten of the entire product of the whole country*? Can labor and capital have any more than all there is produced? Can the product be increased by decreasing the work except so fast as invention may enable us to produce more with less labor?

In an exceedingly prosperous year profits may sometimes exceed ten per cent., as they possibly did in 1880; but the profits have been very much less since 1880, and in a series of years those who class themselves distinctly as working men and women, thus separating themselves from capitalists as a class, must secure to themselves at least ninety per cent. of the total annual product of the country.

How this portion of the product is divided among themselves, and how far it is depleted by unnecessary taxation, are the most important questions for the working people to consider at the present time.

The apparent tendency of all recent attempts to organize labor and to regulate the payment of wages and the hours of labor by agreements among manufacturers with the representatives of great associations, has rather been to reduce the general rate of wages to the level of that of the least skillful workmen, than to increase the share of the product falling to labor as a whole.

All profits and all wages must be derived from the sale of the product in each and all of the arts which are conducted in a civilized country. If the product is diminished, as it must be by any outside interference with freedom of contract on the part of adults, those who do the work must suffer the most from any disturbance or contest. Their present share is at least ninety per cent. of all that is now produced. If that product should be diminished, it would still require as large a sum for the maintenance and increase of capital as is now required; the capital in an eight-hour mill must be as great as in a ten-hour mill; therefore the proportion of the smaller product, which would necessarily be assigned to capital, would be larger than it now is.

Hence the share of the laborer would be diminished both absolutely and relatively.

Those who would suffer most in these changes would be the common laborers, who absolutely depend upon their daily work for their daily bread.

The effect of the aggressive interference of what is now called "organized labor" with established methods of industry is, however, almost of necessity confined to those branches of work which are carried on under the collective or factory system by great subdivisions of labor. Such interference has, even of late, been limited to a small part even of the collective factory work of the country, and although it has caused great excitement, it has done but little harm, having already spent its force. At the moment when these proofs are being corrected, a great strike in the coal-yards of New Jersey and on the docks of New York has also about spent its force.

The arts which are conducted upon the factory system now give employment to only ten per cent. of the people of this country, or one hundred in each one thousand of those who are occupied for gain. It is in these very arts that the greatest abundance of product is now assured with the least amount or quantity of labor, under free conditions of contract both with respect to capital and labor, subject only to such statutes as have been required for the protection of children from overwork. But if the product of these arts should be materially lessened by outside interference of any sort, the great body of consumers outside the factories would be obliged to work harder and longer in order to get less than they do now.

Ten per cent. or less has thus far been assigned to the possible profit of those who own or possess capital, but it does not follow that all the profits thus gained are added to capital previously saved.

We have not yet defined the full proportion of our annual product which is now secured by the working classes, so called.

There is a further distribution among working people even of such profits as have been assigned to capitalists. The living expenses of capitalists and of their families are paid out of their profits; and this portion of their apparent gain is distributed among those who are in private employment of such capitalists. This may not be wholly productive consumption; yet it reduces the sum which might otherwise be added to capital by distributing a portion of the profits of capitalists among those who are actually at work for them. On the other hand, there is a very large addition to the capital of the country from the savings of working people who are not capitalists according to the common use of the word.

This leads to the final question, What is the actual margin of profit on production as a whole which can be secured by capitalists, be they large or small, *to be added to the capital of the whole country?* I think it cannot be as much as ten per cent. I can find no trace of existing capital corresponding to a saving of ten per cent. on the average annual product of the United States for the past generation, and there is very little capital of any kind which retains any value beyond a single generation. The whole present capital of the United States, the richest country in the world, which has been saved during the whole period of the existence of the nation, certainly does not exceed the value of three years' production, and is probably less than the value of two years' production at the present time. It must be remembered that land is not capital; it has no value except the value given to it by the use of labor and capital upon it.

It may therefore be asked, 1st, if the laborers secured to their sole use the whole margin of profit which is now added to the whole capital of the country, how much would the general rate of wages be advanced? 2d, if laborers themselves secured this profit, as a distinct class, and added it in small sums each to the capital of the country, would it become as effective in promoting the increase of future production as it does when it is held in large sums owned by individual capitalists? Is not the profitable use of capital one of the most difficult arts, and are not the great masters in the use of capital most necessary factors in assuring that abundant production upon which the welfare of workmen especially depends, because they consume the greater proportion?

These and other similar questions lie at the very foundation of what is called "Labor Reform." Can any true solution of the main issue be reached until these questions are answered? Are not a vast proportion of working men discontented, and eagerly seeking a share of an assumed margin or supposed profit which has no existence in fact?

On the other hand, if capital — whether massed in great sums in the hands of individuals, or aggregated in small sums by the people themselves — should fail to secure such a profit as would suffice for its maintenance and increase in due proportion to the increase of the population, would not the production of ensuing years be diminished, and in the end would not labor suffer most for want of adequate machinery, for lack of tools, warehouses, railroads, factories, and other forms of capital?

It behooves all the "friends of labor," so called, to be very sure of their premises when denouncing capitalists as a class lest they add

fuel to a dangerous flame. There are many simple principles which are better comprehended by men of affairs than they can be by scholars or clergymen.

One of the most simple rules is this: that under the influence of competition not only of labor with labor, but of capital with capital, the joint product of these two necessary elements of production is increased in vastly greater measure by the use of such capital, than the share of the product which the capitalist secures to himself is increased.

In other words, while the absolute share secured by the capitalist may increase, the relative proportion of the joint product secured by him rapidly decreases; but the share of the laborer is increased both absolutely and relatively.

A careful analysis of each and every important branch of industry for fifty years will prove that capital has secured a decreasing share, while labor has secured an increasing share of a constantly increasing product.

Hence, while all restrictions upon the free use of capital in reputable occupations are bad for the owners, they are very much worse for the workmen.

For instance: if all the cotton-mills were forced into idleness by meddlesome interference and by statute regulations, the hand labor of about sixteen million men and women would become necessary upon their own spinning-wheels and hand-loom, in order to provide the cotton fabrics which are now consumed in the United States, of which fabrics at least ninety per cent. are consumed by these very working people.

The present production of cotton fabrics requires less than two hundred thousand operatives, whose wages or earnings have steadily increased ever since the cotton-factory was established, and are now higher than they ever were before. It does not appear, however, that the capitalists who own the cotton-mills have secured any great portion of the increased product of cotton goods which their machinery has enabled these operatives to make. The consumers of the goods have enjoyed the chief benefit of the increased abundance; but even of what remains to be divided between capital and labor, the operatives, as I have previously shown, now secure five parts where capital secures only one part; and in this art the proportion which goes to labor is *less* than in almost any other of the great manufacturing enterprises, for the very reason that it requires so large a capital to start a single operative. In one continuously successful factory which I have analyzed, in which the farmers' daughters of New England, in 1840, earned \$175 per year each, for thirteen hours per day work,

the sum necessary to give capital ten per cent., to be taken from the product of each operative, was \$113. In that same factory the French-Canadian weaver, working ten hours, now gains \$290 per year, and if capital can secure \$70 from the product, it will earn ten per cent. The share of labor is double per hour, while the share of capital has diminished forty per cent. In fact, much more, because the factory cannot now earn ten per cent. a year.

When even the little margin of profit which is now secured by the capitalist is taken from him, whoever he may be, the only recourse will be to the spinning-wheel and to the handloom.

Or again, when the railway between Chicago and New York fails to yield a profit of fourteen cents for moving a barrel of flour one thousand miles (or less than the value of the empty barrel), which was substantially the margin of profit on the railway service of last year, labor may not only be permitted, but will be required, to do all the work and take all the pay for moving the flour needed in the East from the far-distant West, by the use of its own wheelbarrows or with such other means of transportation as it may be able to provide itself with.

Long before either event could occur, common sense and a little study of the facts of life will have settled what is called the "Labor Question."

A very large part of the present discontent among laboring people (so called to distinguish them from hard-working owners of capital) has been promoted by a misuse of the figures of the census of 1880.

A very common error in the use of the census data of the manufactures of this country—even on the part of intelligent members of Congress who might be expected to know better—consists in deducting the sum of wages and the cost of materials combined, from the value of the goods as given in the census, and then in assuming that the remainder constituted the *profit* of manufacturing. No more erroneous or fallacious deduction could be made. Reference may be made to the figures given in the analysis of manufactures to prove how large a part of the proceeds of sales of goods must be applied to miscellaneous or general charges and expenses.

There is nothing which an expert statistician or census specialist avoids so scrupulously as putting questions which would expose the profit of any business, if answered; because he knows that if the questions are so framed he will either obtain no replies at all, or else he will obtain partial or incorrect replies intended to mislead.

Therefore any and all deductions of alleged profits, from the United States census, or from any State census, or from any State inquiry into the condition of labor, are apt to be mere rubbish, and are not worth a single moment's attention from a student or from a legislator.

The year 1880 was unquestionably a prosperous year, and there may have been an average profit of ten per cent. in the manufacturing arts in that year. Since then the customary rule has held good,—more capital has been invested, there has been a period of so-called depression, the margin of profit has diminished, but the wages of labor have as a whole steadily advanced.

This adjustment is now about completed; laborers are now fully employed; there never has been a period in the history of this or any other country equal to the present in this country, at this period (Jan., 1887), in the following conditions:

First. So large a product made and distributed at so low a cost in ratio to the capital invested either in production or in the mechanism of distribution.

Second. So low a rate of profit sufficing to satisfy capital and to induce further investments in any or all arts.

Third. So high a general rate of wages earned by so small a number of hours of work per day.

Fourth. So large a purchasing power in each unit or dollar of the wages or earnings, when expended for the necessities or comforts of life.

Fifth. In no previous period has the workman received so large a proportion of the joint product of labor and capital, or its equivalent either in money or goods.

Hence it follows that the disturbers of labor have about exhausted their temporary power of mischief. The organizations, associations, or clubs of workmen are now assuming their true and beneficent function, to wit: that of schools of inquiry in which the alphabet of social science will be learned, and by means of which peace, order, and industry will be assured.

It has been necessary to treat only what are called manufactures in order to ascertain the margin of profits, or to estimate the ratio of profits to wages; because the data of agriculture in respect to the amount of capital required are almost wholly wanting.

Capital is labor saved and applied to reproduction. Raw land has no value, and land attains value only when capital and labor are applied to its improvement. The investment of capital in agriculture is, as a general rule, much greater in bringing the land into productive condition, than it is in the investment in buildings and tools upon the land. A very

large part of each year's expenditure consists in maintaining the fertility of the soil after its virgin properties begin to be exhausted, in building and maintaining fences, and in other uses of capital which is often utterly lost, if the effort is suspended even for a very short period. What proportion of the value of the products of agriculture can be assigned as the true margin of profit, it is impossible to state, but it is well known to be very small,—much less than in the manufacturing arts.

There remains only to be considered the margin of profit on the final or retail distribution of all products, both of manufactures and agriculture. In the great city shops the rule of large sales for small profits is the common one—short credits or none being granted. In answer to a question lately put to two of the largest retail dealers in this city, one put his losses by bad debts for the last ten years at less than one-tenth, the other at less than one-sixteenth of one per cent. In the small shops a large margin of profit is required in order to sustain the shop at all, and to cover the risks of loss even on monthly credits. In the distribution of the perishable products of agriculture, the margin between the price which the farmer receives and that which the consumer pays is commonly the largest single element in the cost of food to the consumer, and as the price of food to the working population is one-half the whole cost of living or more, any saving which can be made in this element of life would be very beneficial. It has only been in reducing the cost of distribution in small parcels, at retail, that the system of coöperation has had any substantial success.

From the fullest investigation which I have been able to make, I have become more and more convinced that ten per cent. is the maximum margin of profit on all production in

this country, and that even a less proportion of the product of a normal year is all that can be set aside for the maintenance or increase of capital; conversely, that more than ninety per cent. of each year's product is consumed by those who are engaged in its production, as working people in the sense in which that term is commonly used. Of the ten per cent. or less which is or may be saved and added to capital, a very large share will become the property of those who are themselves working people in the strictest sense—another large share will be saved by persons of moderate means, while the share of the rich will be but the lesser part of the whole sum of profits. This view is sustained by the very small margin of profit which now suffices to draw capital into any and all the principal arts which can be analyzed.

All attempts to measure the progress of the country by comparisons of accumulated wealth, stated in terms of money, are practically worthless. The figures of the census of 1880 have no substantial value, for the reasons given in the preceding comments on the capital in manufacturing, while the data of the census of 1860 and 1870 were very incomplete and even more inaccurate.

The importance of accumulated wealth as a factor in the general welfare depends wholly upon its use, and as capital becomes more effective its ratio to the value of products diminishes; hence it often happens that true progress in material welfare may be more accurately measured by the destruction of what has previously been wealth than by its accumulation. The inventors and the scientists are the greatest destroyers of hardly won wealth, the tendency of science and invention being to substitute less costly and more effective capital for that which has been previously in use.

Edward Atkinson.

STONE WALLS.

ALONG the country roadside, stone on stone,
 Past waving grain-field, and near broken stile,
 The walls stretch onward an uneven pile,
 With rankling vines and lichen overgrown:
 So stand they sentinel. Unchanged, alone,
 They're left to watch the seasons passing slow:
 The Summer's sunlight, or the Winter's snow,
 The Spring-time's birdling, or the Autumn's moan.
 Who placed the stones now gray with many years?
 And did the rough hands tire, the sore hearts ache?
 The eyes grow dim with all their weight of tears?
 Or did the work seem light for some dear sake?
 Those lives are over. All their hopes and fears
 Are lost, like shadows in the morning-break.

Julie M. Lippmann.

ENGLISH AS SHE IS TAUGHT.

IN the appendix to Croker's Boswell's Johnson, one finds this anecdote :

Cato's Soliloquy.—One day Mrs. Gastrel set a little girl to repeat to him [Doctor Samuel Johnson] Cato's Soliloquy, which she went through very correctly. The Doctor, after a pause, asked the child—

"What was to bring Cato to an end?"

She said it was a knife.

"No, my dear, it was not so."

"My aunt Polly said it was a knife."

"Why, Aunt Polly's knife *may do*, but it was a *dag-ger*, my dear."

He then asked her the meaning of "bane and antidote," which she was unable to give. Mrs. Gastrel said—

"You cannot expect so young a child to know the meaning of such words."

He then said—

"My dear, how many pence are there in *sixpence*?"

"I cannot tell, sir," was the half-terrified reply.

On this, addressing himself to Mrs. Gastrel, he said—

"Now, my dear lady, can anything be more ridiculous than to teach a child Cato's Soliloquy, who does not know how many pence there are in sixpence?"

In a lecture before the Royal Geographical Society, Professor Ravenstein quoted the following list of frantic questions, and said that they had been asked in an examination :

Mention all the names of places in the world derived from Julius Cæsar or Augustus Cæsar.

Where are the following rivers : Pisuerga, Sakaria, Guadalete, Jalon, Mulde?

All you know of the following : Machacha, Pilmo, Schebulos, Crivoscia, Basecs, Mancikert, Taxhen, Citeaux, Meloria, Zutphen.

The highest peaks of the Karakorum range.

The number of universities in Prussia.

Why are the tops of mountains continually covered with snow [*sic*]?

Name the length and breadth of the streams of lava which issued from the Skaptar Jokul in the eruption of 1783.

That list would oversize nearly anybody's geographical knowledge. Isn't it reasonably possible that in our schools many of the questions in all studies are several miles ahead of where the pupil is? — that he is set to struggle with things that are ludicrously beyond his present reach, hopelessly beyond his present strength? This remark in passing, and by way of text; now I come to what I was going to say.

I have just now fallen upon a darling literary curiosity. It is a little book, a manuscript compilation, and the compiler sent it to me with the request that I say whether I think it ought to be published or not. I said Yes; but as I slowly grow wise, I briskly grow cautious; and so, now that the publication is imminent, it has seemed to me that I should feel more

comfortable if I could divide up this responsibility with the public by adding them to the court. Therefore I will print some extracts from the book, in the hope that they may make converts to my judgment that the volume has merit which entitles it to publication.

As to its character. Every one has sampled "English as She is Spoke" and "English as She is Wrote"; this little volume furnishes us an instructive array of examples of "English as She is Taught"—in the public schools of—well, this country. The collection is made by a teacher in those schools, and all the examples in it are genuine; none of them have been tampered with, or doctored in any way. From time to time, during several years, whenever a pupil has delivered himself of anything peculiarly quaint or toothsome in the course of his recitations, this teacher and her associates have privately set that thing down in a memorandum-book; strictly following the original, as to grammar, construction, spelling, and all; and the result is this literary curiosity.

The contents of the book consist mainly of answers given by the boys and girls to questions, said answers being given sometimes verbally, sometimes in writing. The subjects touched upon are fifteen in number: I. Etymology; II. Grammar; III. Mathematics; IV. Geography; V. "Original"; VI. Analysis; VII. History; VIII. "Intellectual"; IX. Philosophy; X. Physiology; XI. Astronomy; XII. Politics; XIII. Music; XIV. Oratory; XV. Metaphysics.

You perceive that the poor little young idea has taken a shot at a good many kinds of game in the course of the book. Now as to results. Here are some quaint definitions of words. It will be noticed that in all of these instances the sound of the word, or the look of it on paper, has misled the child:

Aborigines, a system of mountains.

Alias, a good man in the Bible.

Amenable, anything that is mean.

Assiduity, state of being an acid.

Auriferous, pertaining to an orifice.

Ammonia, the food of the gods.

Capillary, a little caterpillar.

Corniferous, rocks in which fossil corn is found.

Emolument, a headstone to a grave.

Equestrian, one who asks questions.

Eucharist, one who plays euchre.

Franchise, anything belonging to the French.

Idolater, a very idol person.

Ipecac, a man who likes a good dinner.

Irrigate, to make fun of.

Mendacious, what can be mended.

Mercenary, one who feels for another.

Parasite, a kind of umbrella.

Parasite, the murder of an infant.

Publican, a man who does his prayers in public.

Tenacious, ten acres of land.

Here is one where the phrase "publicans and sinners" has got mixed up in the child's mind with politics, and the result is a definition which takes one in a sudden and unexpected way :

Republican, a sinner mentioned in the Bible.

Also in Democratic newspapers now and then. Here are two where the mistake has resulted from sound assisted by remote fact :

Plagiarist, a writer of plays.

Demagogue, a vessel containing beer and other liquids.

I cannot quite make out what it was that misled the pupil in the following instances ; it would not seem to have been the sound of the word, nor the look of it in print :

Asphyxia, a grumbling, fussy temper.

Quarternions, a bird with a flat beak and no bill, living in New Zealand.

Quarternions, the name given to a style of art practiced by the Phœnicians.

Quarternions, a religious convention held every hundred years.

Sibillant, the state of being idiotic.

Crosier, a staff carried by the Deity.

In the following sentences the pupil's ear has been deceiving him again :

The marriage was illegible.

He was totally dismasted with the whole performance.

He enjoys riding on a philosopher.

She was very quick at repertoire.

He prayed for the waters to subsidize.

The leopard is watching his sheep.

They had a strawberry vestibule.

Here is one which — well, now, how often we do slam right into the truth without ever suspecting it :

The men employed by the Gas Company go round and speculate the meter.

Indeed they do, dear ; and when you grow up, many and many's the time you will notice it in the gas bill. In the following sentences the little people have some information to convey, every time ; but in my case they failed to connect : the light always went out on the keystone word :

The coercion of some things is remarkable ; as bread and molasses.

Her hat is contiguous because she wears it on one side.

He preached to an egregious congregation.

The captain eliminated a bullet through the man's heart.

You should take caution and be precarious.

The supercilious girl acted with vicissitude when the perennial time came.

That last is a curiously plausible sentence ; one seems to know what it means, and yet

he knows all the time that he doesn't. Here is an odd (but entirely proper) use of a word, and a most sudden descent from a lofty philosophical altitude to a very practical and homely illustration :

We should endeavor to avoid extremes — like those of wasps and bees.

And here — with "zoölogical" and "geological" in his mind, but not ready to his tongue — the small scholar has innocently gone and let out a couple of secrets which ought never to have been divulged in any circumstances :

There are a good many donkeys in theological gardens.

Some of the best fossils are found in theological cabinets.

Under the head of "Grammar" the little scholars furnish the following information :

Gender is the distinguishing nouns without regard to sex.

A verb is something to eat.

Adverbs should always be used as adjectives and adjectives as adverbs.

Every sentence and name of God must begin with a caterpillar.

"Caterpillar" is well enough, but capital letter would have been stricter. The following is a brave attempt at a solution, but it failed to liquify :

When they are going to say some prose or poetry before they say the poetry or prose they must put a semicolon just after the introduction of the prose or poetry.

The chapter on "Mathematics" is full of fruit. From it I take a few samples — mainly in an unripe state.

A straight line is any distance between two places.

Parallel lines are lines that can never meet until they run together.

A circle is a round straight line with a hole in the middle.

Things which are equal to each other are equal to anything else.

To find the number of square feet in a room you multiply the room by the number of the feet. The product is the result.

Right you are. In the matter of geography this little book is unspeakably rich. The questions do not appear to have applied the microscope to the subject, as did those quoted by Professor Ravenstein ; still, they proved plenty difficult enough without that. These pupils did not hunt with a microscope, they hunted with a shot-gun ; this is shown by the crippled condition of the game they brought in :

America is divided into the Passiffic slope and the Mississippi valey.

North America is separated by Spain.

America consists from north to south about five hundred miles.

The United States is quite a small country compared with some other countrys, but is about as industrious.

The capital of the United States is Long Island.
The five seaports of the U. S. are Newfunlan and Sanfrancisco.

The principal products of the U. S. is earthquakes and volcanoes.

The Alaginnies are mountains in Philadelphia.

The Rocky Mountains are on the western side of Philadelphia.

Cape Hateras is a vast body of water surrounded by land and flowing into the Gulf of Mexico.

Mason and Dixon's line is the Equater.

One of the leading industries of the United States is mollasses, book-covers, numbers, gas, teaching, lumber, manufacturers, paper-making, publishers, coal.

In Austria the principal occupation is gathering Austrich feathers.

Gibraltar is an island built on a rock.

Russia is very cold and tyrannical.

Sicily is one of the Sandwich Islands.

Hindoostan flows through the Ganges and empties into the Mediterranean Sea.

Ireland is called the Emigrant Isle because it is so beautiful and green.

The width of the different zones Europe lies in depend upon the surrounding country.

The imports of a country are the things that are paid for, the exports are the things that are not.

Climate lasts all the time and weather only a few days.

The two most famous volcanoes of Europe are Sodom and Gomorrah.

The chapter headed "Analysis" shows us that the pupils in our public schools are not merely loaded up with those showy facts about geography, mathematics, and so on, and left in that incomplete state; no, there's machinery for clarifying and expanding their minds. They are required to take poems and analyze them, dig out their common sense, reduce them to statistics, and reproduce them in a luminous prose translation which shall tell you at a glance what the poet was trying to get at. One sample will do. Here is a stanza from "The Lady of the Lake," followed by the pupil's impressive explanation of it:

Alone, but with unbated zeal,
The horseman plied with scourge and steel;
For jaded now and spent with toil,
Embossed with foam and dark with soil,
While every gasp with sobs he drew,
The laboring stag strained full in view.

The man who rode on the horse performed the whip and an instrument made of steel alone with strong ardor not diminishing, for, being tired from the time passed with hard labor overworked with anger and ignorant with weariness, while every breath for labor he drew with cries full of sorrow, the young deer made imperfect who worked hard filtered in sight.

I see, now, that I never understood that poem before. I have had glimpses of its meaning, in moments when I was not as ignorant with weariness as usual, but this is the first time the whole spacious idea of it ever filtered in sight. If I were a public-school pupil I would put those other studies aside and stick to analysis; for, after all, it is the thing to spread your mind.

We come now to historical matters, histor-

ical remains, one might say. As one turns the pages, he is impressed with the depth to which one date has been driven into the American child's head — 1492. The date is there, and it is there to stay. And it is always at hand, always deliverable at a moment's notice. But the Fact that belongs with it? That is quite another matter. Only the date itself is familiar and sure: its vast Fact has failed of lodgment. It would appear that whenever you ask a public-school pupil when a thing — anything, no matter what — happened, and he is in doubt, he always rips out his 1492. He applies it to everything, from the landing of the ark to the introduction of the horse-car. Well, after all, it is our first date, and so it is right enough to honor it, and pay the public schools to teach our children to honor it:

George Washington was born in 1492.

Washington wrote the Declareation of Independence in 1492.

St. Bartholemew was massacred in 1492.

The Brittainns were the Saxons who entered England in 1492 under Julius Cæsar.

The earth is 1492 miles in circumference.

To proceed with "History":

Christopher Columbus was called the Father of his Country.

Queen Isabella of Spain sold her watch and chain and other millinery so that Columbus could discover America.

The Indian wars were very desecrating to the country.

The Indians pursued their warfare by hiding in the bushes and then scalping them.

Captain John Smith has been styled the father of his country. His life was saved by his daughter Pochahantas.

The Puritans found an insane asylum in the wilds of America.

The Stamp Act was to make everybody stamp all materials so they should be null and void.

Washington died in Spain almost broken-hearted. His remains were taken to the cathedral in Havana.

Gorilla warfare was where men rode on gorillas.

John Brown was a very good insane man who tried to get fugitives slaves into Virginia. He captured all the inhabitants, but was finally conquered and condemned to his death. The Confederasy was formed by the fugitive slaves.

Alfred the Great reigned 872 years. He was distinguished for letting some buckwheat cakes burn, and the lady scolded him.

Henry Eight was famous for being a great widower haveing lost several wives.

Lady Jane Grey studied Greek and Latin and was beheaded after a few days.

John Bright is noted for an incurable disease.

Lord James Gordon Bennett instigated the Gordon Riots.

The Middle Ages come in between antiquity and posterity.

Luther introduced Christianity into England a good many thousand years ago. His birthday was November 1883. He was once a Pope. He lived at the time of the Rebellion of Worms.

Julius Cæsar is noted for his famous telegram dispatch I came I saw I conquered.

Julius Cæsar was really a very great man. He was a very great soldier and wrote a book for beginners in the Latin.

Cleopatra was caused by the death of an asp which she dissolved in a wine cup.

The only form of government in Greece was a limited monkey.

The Persian war lasted about 500 years.

Greece had only 7 wise men.

Socrates . . . destroyed some statues and had to drink Shamrock.

Here is a fact correctly stated; and yet it is phrased with such ingenious infelicity that it can be depended upon to convey misinformation every time it is uncarefully read:

By the Salic law no woman or descendant of a woman could occupy the throne.

To show how far a child can travel in history with judicious and diligent boosting in the public school, we select the following mosaic:

Abraham Lincoln was born in Wales in 1599.

In the chapter headed "Intellectual" I find a great number of most interesting statements. A sample or two may be found not amiss:

Bracebridge Hall was written by Henry Irving.

Snow Bound was written by Peter Cooper.

The House of the Seven Gables was written by Lord Bryant.

Edgar A. Poe was a very curdling writer.

Cotton Mather was a writer who invented the cotton gin and wrote histories.

Beowulf wrote the Scriptures.

Ben Jonson survived Shakspeare in some respects.

In the Canterbury Tale it gives account of King Alfred on his way to the shrine of Thomas Bucket.

Chaucer was the father of English pottery.

Chaucer was a bland verse writer of the third century.

Chaucer was succeeded by H. Wads. Longfellow an American Writer. His writings were chiefly prose and nearly one hundred years elapsed.

Shakspeare translated the Scriptures and it was called St. James because he did it.

In the middle of the chapter I find many pages of information concerning Shakspeare's plays, Milton's works, and those of Bacon, Addison, Samuel Johnson, Fielding, Richardson, Sterne, Smollett, De Foe, Locke, Pope, Swift, Goldsmith, Burns, Cowper, Wordsworth, Gibbon, Byron, Coleridge, Hood, Scott, Macaulay, George Eliot, Dickens, Bulwer, Thackeray, Browning, Mrs. Browning, Tennyson, and Disraeli,—a fact which shows that into the restricted stomach of the public-school pupil is shoveled every year the blood, bone, and viscera of a gigantic literature, and the same is there digested and disposed of in a most successful and characteristic and gratifying public-school way. I have space for but a trifling few of the results:

Lord Byron was the son of an heiress and a drunk-man.

Wm. Wordsworth wrote the Barefoot Boy and Imitations on Immortality.

Gibbon wrote a history of his travels in Italy. This was original.

George Eliot left a wife and children who mourned greatly for his genius.

George Eliot Miss Mary Evans Mrs. Cross Mrs. Lewis was the greatest female poet unless George Sands is made an exception of.

Bulwell is considered a good writer.

Sir Walter Scott Charles Bronte Alfred the Great and Johnson were the first great novelists.

Thomas Babington Makorlay graduated at Harvard and then studied law, he was raised to the peerage as baron in 1557 and died in 1776.

Here are two or three miscellaneous facts that may be of value, if taken in moderation:

Homer's writings are Homer's Essays Virgil the Aneid and Paradise lost some people say that these poems were not written by Homer but by another man of the same name.

A sort of sadness kind of shone in Bryant's poems.

Holmes is a very profligate and amusing writer.

When the public-school pupil wrestles with the political features of the Great Republic, they throw him sometimes:

A bill becomes a law when the President vetos it.

The three departments of the government is the President rules the world, the governor rules the State, the mayor rules the city.

The first conscientious Congress met in Philadelphia.

The Constitution of the United States was established to ensure domestic hostility.

Truth crushed to earth will rise again. As follows:

The Constitution of the United States is that part of the book at the end which nobody reads.

And here she rises once more and untimely. There should be a limit to public-school instruction; it cannot be wise or well to let the young find out everything:

Congress is divided into civilized half civilized and savage.

Here are some results of study in music and oratory:

An interval in music is the distance on the keyboard from one piano to the next.

A rest means you are not to sing it.

Emphasis is putting more distress on one word than another.

The chapter on "Physiology" contains much that ought not to be lost to science:

Physillogigy is to study about your bones stummick and vertebry.

Occupations which are injurious to health are carbolic acid gas which is impure blood.

We have an upper and a lower skin. The lower skin moves all the time and the upper skin moves when we do.

The body is mostly composed of water and about one half is avaricious tissue.

The stomach is a small pear-shaped bone situated in the body.

The gastric juice keeps the bones from creaking.

The Chyle flows up the middle of the backbone and reaches the heart where it meets the oxygen and is purified.

The salivary glands are used to salivate the body.

In the stomach starch is changed to cane sugar and cane sugar to sugar cane.

The olfactory nerve enters the cavity of the orbit and is developed into the special sense of hearing.

The growth of a tooth begins in the back of the mouth and extends to the stomach.

If we were on a railroad track and a train was coming the train would deafen our ears so that we couldn't see to get off the track.

If, up to this point, none of my quotations have added flavor to the Johnsonian anecdote at the head of this article, let us make another attempt:

The theory that intuitive truths are discovered by the light of nature originated from St. John's interpretation of a passage in the Gospel of Plato.

The weight of the earth is found by comparing a mass of known lead with that of a mass of unknown lead.

To find the weight of the earth take the length of a degree on a meridian and multiply by $62\frac{1}{2}$ pounds.

The spheres are to each other as the squares of their homologous sides.

A body will go just as far in the first second as the body will go plus the force of gravity and that's equal to twice what the body will go.

Specific gravity is the weight to be compared weight of an equal volume of or that is the weight of a body compared with the weight of an equal volume.

The law of fluid pressure divide the different forms of organized bodies by the form of attraction and the number increased will be the form.

Inertia is that property of bodies by virtue of which it cannot change its own condition of rest or motion. In other words it is the negative quality of passiveness either in recoverable latency or insipient latescence.

If a laugh is fair here, not the struggling child, nor the unintelligent teacher,—or rather the unintelligent Boards, Committees, and Trustees,—are the proper target for it. All through this little book one detects the signs of a certain probable fact—that a large part of the pupil's "instruction" consists in cramming him with obscure and wordy "rules" which he does not understand and has no time to understand. It would be as useful to cram him with brickbats; they would at least stay. In a town in the interior of New York, a few years ago, a gentleman set forth a mathematical problem and proposed

to give a prize to every public-school pupil who should furnish the correct solution of it. Twenty-two of the brightest boys in the public schools entered the contest. The problem was not a very difficult one for pupils of their mathematical rank and standing, yet they all failed—by a hair—through one trifling mistake or another. Some searching questions were asked, when it turned out that these lads were as glib as parrots with the "rules," but could not reason out a single rule or explain the principle underlying it. Their memories had been stocked, but not their understandings. It was a case of brickbat culture, pure and simple.

There are several curious "compositions" in the little book, and we must make room for one. It is full of naïveté, brutal truth, and unembarrassed directness, and is the funniest (genuine) boy's composition I think I have ever seen:

ON GIRLS.

GIRLS are very stuckup and dignified in their maner and be have your. They think more of dress than anything and like to play with dows and rags. They cry if they see a cow in a far distance and are afraid of guns. They stay at home all the time and go to church on Sunday. They are al-ways sick. They are al-ways funny and making fun of boy's hands and they say how dirty. They cant play marbels. I pity them poor things. They make fun of boys and then turn round and love them. I dont beleave they ever kiled a cat or anything. They look out every nite and say oh ant the moon lovely. Thir is one thing I have not told and that is they al-ways now their lessons bettern boys.

From Mr. Edward Channing's recent article in "Science":

The marked difference between the books now being produced by French, English, and American travelers, on the one hand, and German explorers on the other, is too great to escape attention. That difference is due entirely to the fact that in school and university the German is taught, in the first place to see, and in the second place to understand what he does see.

Mark Twain.

REJECTED.

THE World denies her prophets with rash breath,
 Makes rich her slaves, her flatterers adorns;
 To Wisdom's lips she presses drowsy death,
 And on the brow Divine a crown of thorns.
 Yet blessed, though neglected and despised—
 Who for the World himself hath sacrificed,
 Who hears unmoved her witless mockery,
 While to his spirit, slighted and misprised,
 Whisper the voices of Eternity!

Florence Earle Coates.

CONFEDERATE LINE OF BATTLE IN THE
CHICKAMAUGA WOODS.

CHICKAMAUGA,—THE GREAT BATTLE OF THE WEST.*

AT the beginning of the Civil War I was asked the question, "Who of the Federal officers are most to be feared?" I replied: "Sherman, Rosecrans, and McClellan. Sherman has genius and daring, and is full of resources. Rosecrans has fine practical sense, and is of a tough, tenacious fiber. McClellan is a man of talents, and his delight has always been in the study of military history and the art and science of war." Grant was not once thought of. The light of subsequent events thrown upon the careers of these three great soldiers has not changed my estimate of them; but I acquiesce in the verdict which has given greater renown to some of their comrades. It was my lot to form a more intimate acquaintance with the three illustrious officers, who I foresaw would play an important part in the war. I fought against McClellan from Yorktown to Sharpsburg (Antietam), I encountered Rosecrans at Chickamauga, and I surrendered to Sherman at Greensboro', N. C.—each of the three commanding an army.

On the 13th of July, 1863, while in charge of the defenses of Richmond and Petersburg and the Department of North Carolina, I received an unexpected order to go West. I was seated in a yard of a house in the suburbs of Richmond (the house belonged to Mr. Poe, a relative of the poet), when President Davis, dressed in a plain suit of gray and attended by a small escort in brilliant uniform, galloped up. After a brief salutation, he said:

"Rosecrans is about to advance upon Bragg; I have found it necessary to detail Hardee to defend Mississippi and Alabama. His corps is without a commander. I wish you to command it."

"I cannot do that," I replied, "as General Stewart ranks me."

"I can cure that," answered Mr. Davis, "by making you a lieutenant-general. Your papers will be ready to-morrow. When can you start?"

"In twenty-four hours," was the reply.

Mr. Davis gave his views on the subject, some directions in regard to matters at Chattanooga, and then left in seemingly good spirits. The cheerfulness was a mystery to me. Within a fortnight the Pennsylvania campaign had proved abortive. Vicksburg and Port Hudson had fallen, and Federal gun-boats were now plying up and down the Mississippi, cutting our communications between the east and the west. The Confederacy was cut in two, and the South could readily be beaten in detail by the concentration of Federal forces, first on one side of the Mississippi and then on the other. The end of our glorious dream could not be far off. But I was as cheerful at that interview as was Mr. Davis himself. The bitterness of death had passed with me before our great reverses on the 4th of July. The Federals had been stunned by the defeat at Chancellorsville, and probably would not have made a forward movement for months. A corps could have been sent to General Joe Johnston, Grant could have been crushed, and Vicksburg, "the heart of the Confederacy," could have been saved. The drums that beat for the advance into Pennsylvania seemed to many of us to be beating the funeral march of the dead Confederacy. Our thirty days of mourning were over before the defeat of Lee and Pemberton. Duty, however, was to be done faithfully and unflinchingly to the last.

* It has been necessary to omit from this paper, for magazine publication, several passages, which render it less complete as a study of the campaign and battle.—EDITOR.

The calmness of our Confederate President may not have been the calmness of despair, but it may have risen from the belief, then very prevalent, that England and France would recognize the Confederacy at its last extremity, when the Northern and Southern belliger-

and John F. Reynolds. We four had been in the same mess there. Reynolds had been killed at Gettysburg twelve days before my new assignment. Thomas, the strongest and most pronounced Southerner of the four, was now Rosecrans's lieutenant. It was a

GENERAL BRAXTON BRAGG. (FROM A WAR-TIME PHOTOGRAPH.)

ents were both exhausted. Should the North triumph, France could not hope to retain her hold upon Mexico. Besides, the English aristocracy, as is well known, were in full sympathy with the South.

The condition of our railroads even in 1863 was wretched, so bad that my staff and myself concluded to leave our horses in Virginia, and resupply ourselves in Atlanta. On the 19th of July I reported to General Bragg at Chattanooga. I had not seen him since I had been the junior lieutenant in his battery of artillery at Corpus Christi, Texas, in 1845. The other two lieutenants were George H. Thomas

and strange casting of lots that three messmates of Corpus Christi should meet under such changed circumstances at Chickamauga.

My interview with General Bragg at Chattanooga was not satisfactory. He was silent and reserved and seemed gloomy and despondent. He had grown prematurely old since I saw him last, and showed much nervousness. His relations with his next in command (General Polk) and with some others of his subordinates were known not to be pleasant. His many retreats, too, had alienated the rank and file from him, or at least had taken away that enthusiasm which soldiers feel for the success-

ful general, and which makes them obey his orders without question, and thus wins for him other successes. The one thing that a soldier never fails to understand is victory, and the commander who leads him to victory will be adored by him whether that victory has been won by skill or by blundering, by the masterly handling of a few troops against great odds, or by the awkward use of overwhelming numbers. Long before Stonewall Jackson had risen to the height of his great fame, he had won the implicit confidence of his troops in all his movements. "Where are you going?" one inquired of the "foot cavalry" as they were making the usual stealthy march to the enemy's rear. "We don't know, but old Jack does," was the laughing answer. This trust was the fruit of past victories, and it led to other and greater achievements.

I was assigned to Hardee's old corps, consisting of Cleburne's and Stewart's divisions, and made my headquarters at Tyner's Station, a few miles east of Chattanooga on the Knoxville railroad. The Federals soon made their appearance at Bridgeport, Alabama, and I made arrangements to guard the crossings of the Tennessee north of Chattanooga. A regiment was placed at Sivley's Ford, another at Blythe's Ferry, farther north, and S. A. M. Wood's brigade was quartered at Harrison, in supporting distance of either point. The railroad upon which Rosecrans depended for his supplies ran south of Chattanooga, and had he crossed the river above the town, he would have been separated many miles from his base and his depot. But he probably contemplated throwing a column across the Tennessee to the north of the town to cut off Buckner at Knoxville from a junction with Bragg, and inclose him between that column and the forces of Burnside which were pressing towards Knoxville. On Fast Day, August 21st, while religious services were being held in town, the enemy appeared on the opposite side of the river and began throwing shells

into the houses.* Rev. B. M. Palmer, D. D., of New Orleans, was in the act of prayer when a shell came hissing near the church. He went on calmly with his petition to the Great Being, "who rules in the armies of heaven and among the inhabitants of earth," but at its close, the preacher, opening his eyes, noticed a perceptible diminution of his congregation. Some women and children were killed and wounded by this act. Our pickets and scouts had given no notice of the approach of the enemy. On Sunday, August 30th, we learned through a citizen that McCook's corps had crossed at Caperton's Ferry, some thirty-five miles below Chattanooga, the movement having begun on the 29th. Thomas's corps was also crossing at or near the same point. [See map, page 945.]

The want of information at General Bragg's headquarters was in striking contrast with the minute knowledge General Lee always had of every operation in his front, and I was most painfully impressed with the feeling that it was to be a hap-hazard campaign on our part. My sympathies had all been with the commanding-general. I knew of the carping criticisms of his subordinates and the cold looks of his soldiers, and knew that these were the natural results of reverses, whether the blame for the reverses lay with the commander or otherwise. I had felt, too, that this lack of confidence or lack of enthusiasm, whichever it might be, was ominous of evil for the impending battle. But ignorance of the enemy's movements seemed a still worse portent of calamity. Rosecrans had effected the crossing of the river and had occupied Will's Valley, between Sand and Lookout mountains, without opposition, and had established his headquarters at Trenton. Lookout Mountain now interposed to screen all the enemy's movements from our observation. General Bragg had

The military road was built after Hooker captured the mountain.

said petulantly a few days before the crossing into Will's Valley : "It is said to be easy to defend a mountainous country, but mountains hide your foe from you, while they are full of gaps through which he can pounce upon you at any time. A mountain is like the wall of a house full of rat-holes. The rat lies hidden at his hole, ready to pop out when no one is watching. Who can tell what lies hidden behind that wall?" said he, pointing to the Cumberland range across the river.

On the 7th of September Rosecrans sent McCook to cross Lookout Mountain at Winston's Gap, forty-six miles south of Chattanooga, and to occupy Alpine, east of the mountains. Thomas was ordered to cross the mountain at Stevens's and Cooper's gaps, some twenty-five miles from Chattanooga, and to occupy McLemore's Cove on the east. This cove is a narrow valley between Lookout and Pigeon mountains. Pigeon Mountain is parallel to the former, not so high and rugged, and does not extend so far north, ending eight miles south of Chattanooga. Crittenden was left in Will's Valley to watch Chattanooga.

General Bragg had had some inclosed works constructed at Chattanooga, and the place could have been held by a division against greatly superior forces. By holding Chattanooga in that way, Crittenden's corps would have been neutralized, and a union between Rosecrans and Burnside would have been impossible. Moreover, the town was the objective point of the campaign, and to lose it was virtually to lose all East Tennessee south of Knoxville. If Bragg knew at the time of the prospective help coming to him from the Army of Northern Virginia, it was of still more importance to hold the town, that he might be the more readily in communication with Longstreet on his arrival. Under similar circumstances General Lee detached Early's division to hold the

PANORAMIC VIEW OF THE CHATTANOOGA REGION FROM POINT LOOKOUT, ON LOOKOUT MOUNTAIN. (FROM A LITHOGRAPH, BY PERMISSION OF MR. J. B. LINN.)

heights of Fredericksburg, and neutralized Sedgwick's corps, while he marched to attack Hooker at Chancellorsville. Bragg, however, may have felt too weak to spare even one division from his command. He states in his official report that his effective force of infantry was but thirty-five thousand, while he estimates Rosecrans's at seventy thousand. The returns of the Army of the Cumberland, on the 10th of September, give 78,183 "present for duty." [Including the garrison at Nashville and other garrisons in the department, as well as the forces in and about Chattanooga.—Ed.] Whatever may have been Bragg's motive, he completely abandoned the town by the 8th, and Crittenden took possession of it next day. My corps,* consisting of Breckinridge's and of Cleburne's divisions, had led in the withdrawal, and was halted at Lafayette, twenty-two miles from, and almost south of, Chattanooga, and east of Pigeon Mountain, which separates it from McLemore's Cove, into which the columns of Thomas began to pour on the 9th. I placed Breckinridge in charge of the Reserve Artillery and the wagon train at Lafayette, while Cleburne was sent to hold the three gaps in Pigeon Mountain, Catlett's on the north, Dug in the center, and Blue Bird on the south. General Cleburne pitched his tent by the road leading to the center gap. Notwithstanding the occupation of Chattanooga, Rosecrans did not attempt to concentrate his forces there, but persisted in pushing two of his corps to our left and rear.

As the failure of Bragg to beat Rosecrans in detail has been the subject of much criticism, it may be well to look into the causes of the failure. So far as the commanding general was concerned, the trouble with him was: first, lack of knowledge of the situation; second, lack of personal supervision of the execution of his own orders. No general ever won a permanent fame who was wanting in these grand elements of success, knowledge of his own and his enemy's condition, and personal superintendence of operations on the field. In war, as in every other affair in life, knowledge is power, and it is work that wins. Invidious critics have attributed many of Stonewall Jackson's successes to lucky blunders, or at best to happy inspirations at the moment of striking. Never was there a greater mistake. He studied carefully (shall I add prayerfully?) all his own and his adversary's movements. He knew the situation perfectly, the geography and the topography of the country, the character of the officers opposed to him, the number and material of his troops. He never joined battle without a thorough personal reconnoissance of the field. That duty he trusted to no engineer officer. He knew McClellan, Pope, Banks, and Frémont as though he had the reading of their thoughts. When the time came for him to act, he was in the front to see that his orders were carried out, or were modified to suit the ever-shifting scenes of battle. In the pursuit of McClellan from Richmond to the James, he rode at the head of my division, then in advance. I saw him

* Breckinridge's division of my corps had come up from Mississippi and was substituted for Stewart's, sent to join Buckner.—D. H. H.

GENERAL BUSHROD R. JOHNSON. (FROM A WAR-TIME PHOTOGRAPH.)

at Malvern Hill helping with his own hands to push a piece of artillery of Riley's battery farther to the front.

The failure to attack Negley's division in the cove on September 10th was owing to Bragg's ignorance of the condition of the roads, the obstructions at Dug Gap, and the position of the enemy. He attributed the failure to make the attack on the same force on the 11th to the major-general [Hindman] who had it in charge, whether justly or unjustly, I do not know. The capture of Negley's division would have had a very inspiring effect upon our harassed and discouraged soldiers. All day of the 11th my signal corps and scouts at Blue Bird Gap reported the march of a heavy column to our left and up the cove. These reports were forwarded to the commanding general, but were not credited by him. On the morning of the 13th I was notified that General Polk was to attack Crittenden at Lee and Gordon's Mills, and the Reserve Artillery and baggage trains were specially intrusted to my corps. Breckinridge guarded the roads leading south from Lafayette, and Cleburne

guarded the gaps in Pigeon Mountain. The attack was not made at Lee and Gordon's Mills, and this was the second of the lost opportunities. General Bragg in his official report thus speaks of this failure. He tells of his first order to General Polk to attack, dated six P. M. September 12th, 1863, Lafayette, Ga.:

"GENERAL: I inclose you a dispatch from General Pegram. This presents you a fine opportunity of striking Crittenden in detail, and I hope you will avail yourself of it at daylight to-morrow. This division crushed, and the others are yours. We can then turn again on the force in the cove. Wheeler's cavalry will move on Wilder so as to cover your right. I shall be delighted to hear of your success."

This order was twice repeated at short intervals. The last dispatch was as follows:

"The enemy is approaching from the south — and it is highly important that your attack in the morning should be quick and decided. Let no time be lost."

The rest of the story is thus told by General Bragg:

"At eleven P. M. a dispatch was received from the general [Polk] stating that he had taken up a strong position for defense, and requesting that he should be

heavily reënforced. He was promptly ordered not to defer his attack,—his force being already numerically superior to the enemy,—and was reminded that his success depended upon the promptness and rapidity of his movements. He was further informed that Buckner's corps would be moved within supporting distance the next morning. Early on the 13th, I proceeded to the front, ahead of Buckner's command, to find that no advance had been made upon the enemy and that his forces [the enemy's] had formed a junction and recrossed the Chickamauga. Again disappointed, immediate measures were taken to place our trains and limited supplies in safe positions, when all our forces were concentrated along the Chickamauga threatening the enemy in front."

During the active operations of a campaign, the post of the commander-in-chief should be in the center of his marching columns, that he may be able to give prompt and efficient aid to whichever wing may be threatened. But whenever a great battle is to be fought, the commander must be on the field to see that his orders are executed and to take advantage of the ever-changing phases of the conflict. Jackson leading a cavalry fight by night near Front Royal in the pursuit of Banks, Jackson at the head of the column following McClellan in the retreat from Richmond to Malvern Hill, presents a contrast to Bragg sending, from a distance of ten miles, four consecutive orders for an attack at daylight, which he was never to witness.

Surely in the annals of warfare there is no parallel to the coolness and nonchalance with which the Federal General Crittenden marched and counter-marched for a week with a delightful unconsciousness that he was in the presence of a force of superior strength. On the 11th we find him with two divisions (Van Cleve's and Palmer's) at Ringgold, twenty miles from Chattanooga, and with his third (Thomas Wood's) at Lee and Gordon's Mills, ten miles from Ringgold. Wood remained there, alone and unsupported, until late in the day of the 12th. Crittenden was at the mills with his whole corps on the 13th and morning of the 14th, moving back to Missionary Ridge on the 14th, but keeping Wood at Gordon's all that day. General Crittenden seemed to think that so long as the bridge there was held, there was no danger of the rebels passing to his rear on the road towards Chattanooga, though there were other bridges and several good fords over the Chickamauga at other points. It was to the isolation of Wood that Bragg refers in his order dated Lafayette, six P. M. on the 12th. Captain Polk (in the Southern Historical Society papers) says:

"General Bragg, in his official report of the battle of Chickamauga, charges General Polk with the failure to crush Crittenden's forces in their isolated position at Ringgold. It will be noted, however, that General

CRAWFISH SPRINGS. (FROM A RECENT PHOTOGRAPH.)

forces in the afternoon and night of the 12th. But even with that knowledge, he would have acted wisely in falling upon the combined forces on the 13th and 14th. Why did he not? Colonel Archer Anderson says in an address before the Virginia Division of the Army of Northern Virginia Association :

Polk was ordered to take position at a particular spot,—Rock Spring,—thence, if not attacked, to advance by daylight of the 13th of September, and assume the offensive against the opposing forces, which were expected from the way of Ringgold. But Crittenden was at Gordon's Mills behind the Chickamauga on the evening of the 12th. The order was simply impracticable." [See letter from Capt. Polk, page 964.—ED.]

The concentration at Rock Spring, seven miles south-west from Ringgold and four and a half miles south-east from Lee and Gordon's Mills, was apparently to interpose between Crittenden's columns, and to strike in detail whichever presented itself. But General Crittenden, unaware, apparently, of his danger, crossed the Chickamauga at the mills, and united with Wood about nightfall on the 12th. General Polk discovered that there was a large force in front of him on the night of the 12th, and not a single division, and hence he thought only of a defensive attitude. It is probable that, from his long experience of Bragg's ignorance of the situation, he was skeptical in regard to the accuracy of the general's information on the present occasion. Bragg certainly did not know of the union of Crittenden's

"These failures to secure the execution of his designs seem to have paralyzed the Confederate commander during the next four days, for it was not till the night of the 17th that Bragg issued another order for a movement against the enemy. And yet these were four days of critical peril for the Federal army. It was only at midnight of the 12th that McCook, on their extreme right, received the order to close upon Thomas. It was only on the 17th, after four days' hard marching, that his junction with Thomas was effected. During these four days McCook's whole corps was as completely annulled as if it had been in Virginia, and during a part of this time there was a wide interval separating Crittenden and Thomas. The Confederate army was perfectly in hand. What chances did those four days not offer to an enterprising commander ! But General Bragg's spirit seems to have been damped by the miscarriages I have described. Rosecrans was, on the other hand, completely aroused. He saw now, as he himself says, that it was a matter of life and death to concentrate his army. During these four days the Federal army marched as men march upon issues of life and death, but the Confederates lay in their camps in idle vacancy. . . . It is true that reinforcements were now about to arrive, but General Bragg well knew they would not counterbalance McCook's corps. The inaction of those four days is not to be explained."

The truth is, General Bragg was bewildered by "the popping out of the rats from so many

holes." The wide dispersion of the Federal forces, and their confronting him at so many points, perplexed him, instead of being a source of congratulation that such grand opportunities were offered for crushing them one by one. He seemed to have had no well-organized system of independent scouts, such as Lee had, and such as proved of inestimable service to the Germans in the Franco-Prussian war. For information in regard to the enemy, apparently he trusted alone to his very efficient cavalry. But the Federal cavalry moved with infantry supports, which could not be brushed aside by our cavalry. So General Bragg only learned that he was encircled by foes, without knowing who they were, what was their strength, and what were their plans. His enemy had a great advantage over him in this respect. The negroes knew the country well, and by dividing the numbers given by them by three, trustworthy information could be obtained. The waning fortunes of the Confederacy was developing a vast amount of "latent unionism" in the breasts of the original secessionists — those fiery zealots who in '61 proclaimed that "one Southerner could whip three Yankees," though there was never a single individual among the zealots who was willing to be the one Southerner. The negroes and the fire-eaters with "changed hearts" were now most excellent spies.

The 13th of September was a day of great anxiety to me at Lafayette, in charge of the Reserve Artillery and the wagon trains, with only two weak divisions, less than nine thousand strong, to protect them. During the 11th and 12th my signal corps on Pigeon Mountain

had been constantly reporting the march of a heavy column to our left and rear. These reports were communicated by me to the commanding general, and were discredited by him. At eight A. M. on the 13th, Lieutenant Baylor came to my camp with a note from General Wharton, of the cavalry, vouching for the lieutenant's entire trustworthiness. Lieutenant Baylor told me that McCook had encamped the night before at Alpine, twenty miles from Lafayette, towards which his march was directed. Our cavalry pickets had been driven in on the Alpine road the afternoon before, and had been replaced by infantry. Soon after the report by Lieutenant Baylor, a brisk fire opened upon the Alpine road, two miles from Lafayette. I said to my staff, as we galloped toward the firing, "It is to be South Mountain over again." This referred to the defense, on the 14th of September, 1862, of the passes of that mountain by my gallant division, reduced by fighting and marching to five thousand men.

We learned, on reaching the Alpine road, that General Dan Adams's skirmishers had been attacked by two regiments of cavalry, which were repulsed. General Adams said to me, "The boldness of the cavalry advance convinces me that an infantry column is not far off." Lucius Polk's brigade was brought down from Pigeon Mountain, and every disposition was made to celebrate appropriately the next day — the anniversary of South Mountain. But that was not to be. General McCook (Federal) had been ordered to Summerville, eleven miles south of Lafayette on the main road to Rome, Ga. But he had become

MAP OF THE VICINITY OF CHATTANOOGA.

cautious after hearing that Bragg was not making that hot and hasty retreat which Rosecrans had supposed he was making. He therefore ordered his wagon-train back to the top of Lookout Mountain, and remained all day of the 13th at Alpine. His cavalry had taken some prisoners from General Adams, and he thus learned certainly that Bragg had been reënforced. At midnight on the 13th McCook received the order to hurry back to join Thomas. Then began that race of "life and death," the crossing back over Lookout Mountain, the rapid, exhausting march north through Lookout Valley, and the junction at last at Stevens's Gap on the 17th. The contemporary accounts represent McCook's march as one of fatigue and suffering.

General Bragg returned to Lafayette on the afternoon of the 13th, and I communicated to him verbally that night the report of Lieutenant Baylor. He replied excitedly, "Lieutenant Baylor lies. There is not an infantry soldier of the enemy south of us." The next morning he called his four corps commanders, Polk, Buckner, Walker, and myself, together, and told us that McCook was at Alpine, Crittenden at Lee and Gordon's Mills, and Thomas in McLemore's Cove. McCook was at that very time making that famous march, estimated by Rosecrans at fifty-seven miles, to join Thomas at Stevens's Gap. But the Confederate commander did not know of this withdrawal, and possibly the fear of an attack in his rear by McCook kept him from falling upon Thomas and Crittenden in his front. The nightmare upon him for the next three days was due, doubtless, to his uncertainty about the movements of his enemy, and to the certainty that there was not that mutual confidence between him and some of his subordinates that there ought to be between the chief and his officers to insure victory. Bragg's want of definite and precise information had led him more than once to issue "impossible" orders, and therefore those intrusted with their execution got in the way of disregarding them. Another more serious trouble with him was the disposition to find a scapegoat for every failure and disaster. This made his officers cautious about striking a blow when an opportunity presented itself, unless they were protected by a positive order. General Lee sought for no vicarious victim to atone for his *one* disaster. "I alone am to blame; the order for attack was mine," said he, after the repulse of the assault upon Cemetery Ridge at Gettysburg. Lee and Bragg were cast in different molds.

In reference to the long intervals between battles in the West, I once said to General

Patton Anderson, "When two armies confront each other in the East, they get to work very soon; but here you look at one another for days and weeks at a time." He replied with a laugh, "Oh, we out here have to crow and peck straws awhile before we use our spurs." The crowing and pecking straws were now about over. On the 13th Rosecrans awoke from his delusion that Bragg was making a disorderly retreat, and issued his orders for the concentration of his army in McLemore's Cove. Granger's corps came up from Bridgeport, occupied Rossville on the 14th, and remained there until the battle of the 20th. Rossville is at the gap in Missionary Ridge through which runs the road from Chattanooga to Lafayette and Rome, Ga. General Rosecrans had felt it to be of vital importance to hold this gap at all hazards, in case of a disaster to his arms. On the 17th Rosecrans had his forces well in hand, extending from Lee and Gordon's Mills to Stevens's Gap, in a line running from east to south-west some eleven miles long. On the same day Bragg, with headquarters still at Lafayette, held the gaps in Pigeon Mountain, and the fords to Lee and Gordon's Mills. Each commander was in position, on the 17th, to turn the left flank of his adversary,—Bragg by crossing the Chickamauga at points north of Lee and Gordon's Mills; but by this he risked fighting with his back to the river,—a hazardous situation in case of defeat. He risked too, to some extent, his trains, which had yet to be moved towards Ringgold and Dalton. His gain, in case of a decided victory, would be the cutting off of Rosecrans from Chattanooga, and possibly the recapture of that place. Rosecrans could have flanked Bragg by crossing at Gordon's and the fords between that place and Catlett's. This would have cut off Bragg from Rome certainly, and from Dalton in case of his advance upon Chattanooga, or else would have compelled him to come out and fight upon ground selected by his antagonist. This is what Hooker aimed to do at Chancellorsville, but was foiled in his attempt by the famous flank march of Stonewall Jackson. The risk to Rosecrans was an insecure line of retreat in case of defeat, and possibly the loss of Chattanooga. But he had Granger's corps to hold the fortifications of Chattanooga, and he held also the gaps in Lookout Mountain. Bragg showed superior boldness by taking the initiative. Rosecrans determined to act upon the defensive. He says that he knew on the 17th that Bragg would try to seize the Dry Valley and Rossville roads—the first on the west and the second on the east of Missionary Ridge. He thus divined the plan of his enemy twelve hours before Bragg's order was issued. Therefore Rosecrans, on the after-

noon of the 17th, ordered McCook to take the place of Thomas at Pond Spring, Thomas to relieve the two divisions of Crittenden at Crawfish Springs, and Crittenden to take these divisions and extend them to the left of Wood at Lee and Gordon's, so as to protect the road to Chattanooga. General Rosecrans says :

"The movement for the concentration of the corps more compactly towards Crawfish Springs was begun on the morning of the 18th, under orders to conduct it secretly, and was executed so slowly that McCook's corps only reached Pond Spring at dark, and bivouacked resting on their arms during the night. Crittenden's corps reached its position on the Rossville road near midnight."

Thomas marched all night uninterruptedly, and the head of his columns reached the Widow Glenn's (Rosecrans's headquarters) at daylight on the 19th. Baird's division was posted there, and Brannan's, on coming up, was placed on Baird's left, so as to cover the road to Reed's and to Alexander's bridges on the Chickamauga.

On the 18th General Bragg issued, from Leet's tan-yard, his order for battle as follows :

"1. Johnson's column (Hood's), on crossing at or near Reed's Bridge, will turn to the left by the most practicable route, and sweep up the Chickamauga towards Lee and Gordon's Mills.

"2. Walker, crossing at Alexander's Bridge, will unite in this move and push vigorously on the enemy's flank and rear in the same direction.

"3. Buckner, crossing at Tedford's Ford, will join in the movement to the left, and press the enemy up the stream from Polk's front at Lee and Gordon's.

"4. Polk will press his forces to the front of Lee and Gordon's Mills, and if met by too much resistance to cross will bear to the right and cross at Dalton's Ford or at Tedford's, as may be necessary, and join the attack wherever the enemy may be.

"5. Hill will cover our left flank from an advance of the enemy from the cove, and, by pressing the cavalry in his front, ascertain if the enemy is reënforcing at Lee and Gordon's Mills, in which event he will attack them in flank.

"6. Wheeler's cavalry will hold the gaps in Pigeon Mountain, and cover our rear and left, and bring up stragglers.

"7. All teams, etc., not with troops should go towards Ringgold and Dalton, beyond Taylor's Ridge. All cooking should be done at the trains; rations when cooked will be forwarded to the troops.

"8. The above movements will be executed with the utmost promptness, vigor, and persistence."

Had this order been issued on any of the four preceding days, it would have found Rosecrans wholly unprepared for it, with but one solitary infantry division (Wood's) guarding the crossings of the Chickamauga, and that at one point only, Lee and Gordon's—the fords north of it being watched by cavalry. Even if the order had been given twenty-four hours earlier, it must have been fatal to Rosecrans in the then huddled and confused grouping of his forces.

All that was effected on the 18th was the sending over of Walker's small corps of a lit-

tle more than five thousand men near Alexander's Bridge and Bushrod Johnson's division of three thousand six hundred men at Reed's Bridge, farther north. These troops drove off Wilder's mounted infantry from the crossings immediately south of them, so as to leave undisputed passage for Bragg's infantry, except in the neighborhood of Lee and Gordon's. On the night of the 18th Bragg's troops were substantially as follows : Hill's corps on the extreme left, with center at Glass's Mill ; Polk's at Lee and Gordon's ; Buckner's at Byram's Ford ; Hood's at Tedford's Ford.* During the night Cheatham's division of Polk's corps was detached, moved down the Chickamauga, and crossed at Hunt's Ford about seven A. M. on the 19th. On that morning the Federal line of battle ran, in the main, parallel to the Chattanooga road from Lee and Gordon's to beyond Kelly's farm, and consisted of the divisions of Wood, Van Cleve, and Palmer of Crittenden's corps, and Baird's and Brannan's of Thomas's corps, in the order named from right to left. Negley and Reynolds, commanders under Thomas, had not come up at the opening of the battle of the 19th. The leading division (R. W. Johnson's) of McCook's corps reached Crawfish Springs at an early hour that day, and the divisions of Davis and Sheridan soon followed. It is about five miles from Crawfish Springs to Kelly's farm.

BATTLE OF THE 19TH OF SEPTEMBER.

SOON after getting into position at Kelly's after his night march, General Thomas was told by Colonel Dan McCook, commanding a brigade of the Reserve Corps, that there were no rebel troops west of the Chickamauga, except one brigade that had crossed at Reed's Bridge the afternoon before, and which could be easily captured, as he (McCook) had burned the bridge behind the rebels. Thomas ordered Brannan to take two brigades and make a reconnoissance on the road to Reed's Bridge, and place a third brigade on the road to Alexander's Bridge. This order took the initiative away from Bragg, and put it in the hands of Thomas with his two divisions in line to crush the small Confederate force west of the river, and then with *his* supports, as they came, beat, in detail, the *rebel* supports, delayed, as they must be, by the crossings and the distances to march. Croxton's brigade, of Brannan's division, met Forrest's cavalry on the Reed's Bridge road, and drove it back on the infantry—two small brigades under Ector and Wilson. These advanced with the "rebel yell," pushed Croxton back, and ran over his

* Hood's division, about five thousand strong, was the only portion of Longstreet's corps in the action of the 19th.—D. H. H.

battery, but were in turn beaten back by Brannan's and Baird's forces. Baird now began the readjustment of his lines, and during the confusion of the movement Liddell's (Confederate) division, two thousand strong, struck the brigades of Scribner and King, and drove them in disorder, capturing Loomis's battery, commanded by Lieutenant Van Pelt. Bush's Indiana battery was captured at the same time. The defeat had become a panic, and Baird's and Brannan's men were going pell-mell to the rear, when the victorious Liddell found himself in the presence of a long line of Federal troops overlapping both flanks of his little force. These were the troops of Brannan's reorganized division on his right, and of the freshly arrived division of R. W. Johnson from McCook. Liddell extricated himself skillfully, losing heavily, however, and being compelled to abandon his captured guns. It was by Rosecrans's own order, at 10:15 A. M., that R. W. Johnson had been hurried forward five miles from Crawfish Springs, just in time to save the Federal left from a grave disaster. At eleven A. M. Bragg ordered Cheatham to the relief of Liddell, but he reached the ground after Johnson—too late to drive Brannan as well as Baird off the field. Cheatham's veteran division of seven thousand men advanced gallantly, driving the enemy before it, when it was in its turn hurled back by an attacking column which Thomas had organized after the defeat of Liddell and the arrival of two fresh divisions, viz., Palmer's of Crittenden's corps and Reynolds's of his own corps. General Thomas tells us that these divisions (Johnson on the left, Palmer in the center, and Reynolds on the right)

"advanced upon the enemy, attacking him in flank and driving him in great disorder for a mile and a half, while Brannan's troops met him in front, as he was pursuing Baird's retiring brigades. . . . The enemy at this time being hardly pressed by Johnson, Palmer, and Reynolds in flank fell back in confusion upon his reserves, posted in a strong position on the west side of Chickamauga Creek, between Reed's and Alexander's bridges. Brannan and Baird were then ordered to reorganize their commands."

General Thomas thus groups together, and disposes of as one attack, the successive attacks of Liddell and of Cheatham. Unfortunately for the Confederates, there was no general advance, as there might have been along the whole line—an advance that must have given a more decisive victory on the 19th than was gained on the 20th. It was desultory fighting from right to left, without concert, and at inopportune times. It was the sparring of the amateur boxer, and not the crushing blows of the trained pugilist. From daylight on the 19th until after midday, there was a gap of two miles between Crittenden and Thomas,

into which the Confederates could have poured, turning to right or left, and attacking in flank whichever commander was least prepared for the assault. As Cheatham was falling back, A. P. Stewart's division of Buckner's corps, three thousand four hundred strong, attacked Palmer's division of Crittenden's corps, which was flanking Cheatham, drove it back, and marching forward met Van Cleve's division of the same corps hastening to the assistance of Thomas, and hurled it back also. Hood, with his own and Bushrod Johnson's division, moved at 2:30 P. M., and gained for a time a most brilliant success, crushing the right center of the Federal army, capturing artillery, and seizing the Chattanooga road. The three Confederate divisions had, after their first triumphs, to encounter the four fresh divisions of Wood, Davis, Sheridan, and Negley, and were in turn driven back to the east of the road. Rosecrans thus refers to the attack of Stewart, followed by that of Hood and Johnson:

"Palmer's right was soon overlapped [by Stewart], when Van Cleve's division came to his support, but was beaten back, when Reynolds's division came in, and was in turn overpowered. Davis's division came into the fight then most opportunely and drove the enemy, who soon, however, developed a superior force against his line, and pressed him so heavily that he was giving ground, when Wood's division came, and turned the tide of battle the other way. About three P. M., General McCook was ordered to send Sheridan's division to support our line near Wood and Davis, directing Lytle's brigade to hold Gordon's Mills, our extreme right. Sheridan also arrived opportunely to save Wood from disaster, and the rebel tide was thoroughly stayed in that quarter. Meanwhile the roar of musketry in our center grew louder, and evidently approached headquarters at Widow Glenn's house, until musket-balls came near and shells burst about it. . . . Negley reported with his division, and as the indications became clearer that our center was being driven, he was dispatched in that direction, and soon found that the enemy had dislodged Van Cleve from the line, and was forming there, even while Thomas was driving his right. Orders were promptly given Negley to attack him, which he soon did, and drove him steadily till night closed the combat."

The Federals, all unconscious that they had been all day fighting detachments of inferior forces, prided themselves upon having defeated "Longstreet's splendid corps from Virginia," possibly supposing that it was twenty-five thousand strong, instead of only about five thousand, on the field, as the returns show.

Stewart had recaptured the battery lost by Cheatham's division, twelve pieces of Federal artillery, over two hundred prisoners, and several hundred rifles. Hood and Bushrod Johnson had met with a similar success at first, but, of course, three divisions could not stand the combined attack of six.

On our extreme left a good deal of demonstrating had been done by the Federals on the

17th and 18th; infantry had been crossed over at Owen's Ford, and threats made at Glass's Mill. On the 19th I ordered an attack at the latter place. Slocomb's battery had a bloody artillery duel with one on the west of the river, and, under cover of the artillery fire, Helm's brigade of Breckinridge's division was crossed over, and attacked Negley's infantry and drove it off. Riding over the ground with Breckinridge, I counted eleven dead horses at the Federal battery, and a number of dead infantry men who had not been removed. The clouds of dust rolling down the valley revealed the precipitate retirement of the foe, not on account of our pressure upon him, but on account of the urgency of the order to hurry to their left. Now was the time to relieve the strain upon our right by attacking the Federal right at Lee and Gordon's. My veteran corps, under its heroic division commanders, Breckinridge and Cleburne, would have flanked the enemy out of his fortifications at this point, and would by their brilliant onset have confounded Rosecrans in his purpose of massing upon his left; but Bragg had other plans than of reverse movements. The Irish recruit, when scolded for not keeping step on squad drill, answered, "Faith, it's the other bhoys that won't kape step wid me." The great commander is he who makes his antagonist keep step with him. Thomas, like the grand soldier he was, by attacking first, made Bragg and his rebel boys keep step with him. He who begins the attack assumes that he is superior to his enemy, either in numbers or in courage, and therefore carries with him to the assault all the moral advantage of his assumed superiority.

At three P. M. I received an order to report to the commander-in-chief at Tedford's Ford, to set Cleburne's division in motion to the same point, and to relieve Hindman at Gordon's with Breckinridge's division. Cleburne had six miles to march over a road much obstructed with wagons, artillery, and details of soldiers. He got in position on the extreme right after sundown. Thomas had, in the mean while, moved Brannan from his left to his right, and was retiring Baird and Johnson to a better position, when Cleburne, with Cheatham upon his left, moved upon them "in the gloaming" in magnificent style, capturing three pieces of artillery, a number of caissons, two stands of colors, and three hundred prisoners. The contest was obstinate, for a time, on our left, where log breastworks were encountered; and here that fine soldier, Brigadier-General Preston Smith, of Cheatham's division, lost his life. Discovering that our right extended beyond the enemy, I threw two batteries in advance of our fighting line

and almost abreast of that of the enemy. These caused a hasty abandonment of the breastworks and a falling back of some half a mile. This ended the contest for the day. General Rosecrans thus sums up the result:

"The battle had secured us these objects. Our flanks covered the Dry Valley and the Rossville roads, while our cavalry covered the Missionary Ridge and the valley of Chattanooga Creek, into which latter place our spare trains had been sent on Friday, the 18th. We also had indubitable evidence of the presence of Longstreet's corps and Johnston's forces by the capture of prisoners from each. And the fact that at the close of the day we had present but two brigades which had not been opportunely and squarely in action, opposed to superior numbers of the enemy, assured us that we were greatly outnumbered, and that the battle the next day must be for the safety of the army and the possession of Chattanooga."

A Federal newspaper account of the time makes the frank statement:

"What advantage generally had been gained was with the rebels. They had successively overcome the obstacle of the river in their front, forcing the Federal line from it at every point until it lay in a country almost destitute of water. Not enough could be had for the men's coffee, and what was had was obtained from springs several miles distant."

At a time when it was raining in torrents day and night, and rations were scarce in the Southern camps (and when were they not scarce?), General F—— ordered an Irish soldier, for some misconduct, "to be confined for ten days on bread and water." "Thank yer Honor kindly for the bread," said Pat; "it is not often we see the likes of that. But niver mind the wather; we gits plenty of it." On that 19th of September we had plenty of water for coffee, but not a grain of coffee for the water. I had almost overlooked the two sacks of coffee found on one of the caissons captured by Cleburne's Irishmen. Major Cross of my staff offered them fifty dollars in Confederate money for a haversack full of the precious berries. As the money was about as valuable as oak-leaves, Patrick was not in a trading humor, but with true delicacy evaded his objection to the nature of the currency: "Niver mind the Confederate money, major; whin we've pounded the grains with an axe, and biled the wather, we'll give ye a tin cupful, if we can find ye." The major was not found.

General Rosecrans made a very natural mistake about our overwhelming numbers. But it *was* a big mistake. The South, from patriotic pride, still kept up its old military organizations, for how could it merge together divisions and brigades around which clustered such glorious memories? But the waste of war had reduced them to mere skeleton divisions and brigades. My corps at Chickamauga was but little more than one-third of the size of my division at Yorktown, and so

it was through the whole Southern army. The North, with larger numbers to recruit from, could keep its organizations full, and it did so. Captain W. M. Polk, from data furnished him by General Marcus J. Wright, has given an estimate of the numbers in the respective corps and divisions of the two armies; he concludes that the Federals had 45,855, and the Confederates 33,897 in the battle of the 19th.

I witnessed some of the heaviest fighting on the afternoon of the 19th, and never saw so little straggling from the field. I saw but one deserter from Hood's ranks, and not one from Cleburne's. The divisions of Hindman, Breckinridge, and Preston had not been put into the fight, and two brigades of McLaws's (Kershaw's and Humphreys's) were expected next day. Rosecrans had put in all but two of his brigades. The outlook seemed hopeful for the Confederates. Longstreet arrived at eleven p. m. on the 19th.

While lying on the Rapidan in August, after that disastrous day at Gettysburg, Longstreet had suggested to General Lee the reënforcing of Bragg. The general went to Richmond, and after a time got the consent of the Confederate authorities to send Longstreet, without artillery or cavalry, with the much reduced divisions of McLaws and Hood. Lee followed Longstreet to his horse to see him off, and as he was mounting said, "General, you must beat those people." Lee always called the Federals "those people." Longstreet, withdrawing his foot from the stirrup, said, "General, if you will give your orders that the enemy, when beaten, shall be destroyed, I will promise to give you victory, if I live; but I would not give the life of a single soldier of mine for a barren victory." Lee replied, "The order has been given and will be repeated."*

Soon after the arrival of Longstreet, General Bragg called together some of his officers and ventured upon that hazardous experiment, a change of organization in face of the enemy. He divided his army into two wings; he gave to Polk the right wing, consisting of the corps of Hill and of Walker, and the division of Cheatham,—comprising in all 18,794 infantry and artillery, with 3500 cavalry under Forrest; to Longstreet he gave the left wing, consisting of the corps of Buckner and of Hood, and the division of Hindman—22,849 infantry and artillery, with 4000 cavalry under Wheeler. That night Bragg announced his purpose of adhering to his plan of the 19th for the 20th, viz., successive attacks from right to left, and he gave his wing commanders orders to begin at daylight. Mr. Lincoln, in reference to a change of commanders during a campaign, said, "It is a bad plan to swap horses in the

middle of a stream." Some of the results of Bragg's swap were bad. I left Cleburne, after his fight, at eleven p. m., and rode with Captains Coleman and Reid five miles to Tedford's Ford, where the orders for the day announced that Bragg's headquarters would be, that I might get instructions for the next day. On the way I learned from some soldiers that Breckinridge was coming up from Lee and Gordon's. I sent Captain Reid to him to conduct him to Cleburne's right. General Polk, however, as wing commander, gave General Breckinridge permission to rest his weary men, and took him to his own headquarters. It was after two o'clock when General Breckinridge moved off under the guidance of Captain Reid, and his division did not get into position until after sunrise. Captain Coleman and myself reached the ford after midnight, only to learn that Bragg was not there. Some time after the unsuccessful search, my other staff-officers came up, and my chief-of-staff gave me a message from General Polk that my corps had been put under his command, and that he wished to see me at Alexander's Bridge. He said not a word to any of them about an attack at daylight, nor did he to General Breckinridge, who occupied the same room with him that night. I have by me written statements from General Breckinridge and the whole of my staff to that effect. General Polk had issued an order for an attack at daylight, and had sent a courier with a copy, but he had failed to find me. I saw the order for the first time nineteen years afterwards in Captain Polk's letter to the Southern Historical Society. At three a. m. on the 20th, I went to Alexander's Bridge, but not finding the courier who was to be posted there to conduct me to General Polk, I sent Lieutenant Morrison, aide-de-camp, to hunt him up, and tell him I could be found on the line of battle, which I reached just after daylight, before Breckinridge had got into position. Neither of my division commanders had heard anything of the early attack, and cooked rations were being distributed to our men, many of whom had not eaten anything for twenty-four hours. At 7:25 an order was shown me from General Polk, directed to my major-generals, to begin the attack. I sent a note to him that I was adjusting my line, and that my men were getting their rations. General Polk soon after came up, and assented to the delay. Still nothing was said of the daylight attack. General Bragg rode up at eight a. m., and inquired of me why I had not begun the attack at daylight. I told him that I was hearing then for the first time that such an order had been issued, and had not known whether we were to be assailants or assailed. He said angrily, "I

found Polk after sunrise sitting down reading a newspaper at Alexander's Bridge, two miles from the line of battle, where he ought to have been fighting."

However, the essential preparations for battle had not been made up to this hour and, in fact, could not be made without the presence of the commander-in-chief. The position of the enemy had not been reconnoitered, our line of battle had not been adjusted, and part of it was at right angles to the rest; there was no cavalry on our flanks, and no order had fixed the strength or position of the reserves. My corps had been aligned north and south to be parallel to the position of the enemy. Cheatham's division was at right angles to my line, and when adjusted was found to be exactly behind Stewart's, and had therefore to be taken out after the battle was begun, and placed on reserve. Kershaw's brigade of Longstreet's corps was also out of place, and was put on reserve.

BATTLE OF THE 20TH OF SEPTEMBER.

ROSECRANS in person made a careful alignment of his whole line in the morning, arranging it so as to cover the Rossville (Chattanooga) and the Dry Valley roads. It began four

hundred yards east of the Rossville road, on a crest which was occupied from left to right by Baird's division (Thomas's corps), Johnson's division (McCook's), Palmer's division (Crittenden's), and Reynolds's division (Thomas's). These four divisions became isolated during the day, and the interest of the battle centers largely in them. They lay behind substantial breastworks of logs,* in a line running due south and bending back towards the road at each wing. "Next on the right of Reynolds," says a Federal newspaper account, "was Brannan's division of Thomas's corps, then Negley's of the same corps, its right making a crotchet to the rear. The line across the Chattanooga road towards Missionary Ridge was completed by Sheridan's and Davis's divisions of McCook's corps: Wood's and Van Cleve's divisions of Crittenden's corps were in reserve at a proper distance." The line from Reynolds extended in a south-westerly direction. Minty's cavalry covered the left and rear at Missionary Mills; Mitchell's and Wilder's cavalry covered the extreme right. Rosecrans's headquarters were at Widow Glenn's house.

The Confederate line ran at the outset from north to south, Hills corps on the right, next Stewart's division, Hood in reserve, then Bushrod Johnson's, then Hindman's on the extreme

*The ringing of axes in our front could be heard all night.—D. H. H.

These breastworks were described as follows by Mr. W. F. G. Shanks, war correspondent of the "New York Herald": "General Thomas had wisely taken the precaution to make rude works about breast-high along his whole front, using rails and logs for

the purpose. The logs and rails ran at right angles to each other, the logs keeping parallel to the proposed line of battle and lying upon the rails until the proper height was reached. The spaces between these logs were filled with rails, which served to add to their security and strength. The spade had not been used."—EDITOR.

left, Preston in reserve. After the fighting had actually begun, Walker, Cheatham, and Kershaw were taken out and put in reserve. Wheeler's cavalry covered our left, and Forrest had been sent, at my request, to our right. The Confederates with six divisions were confronted with eight Federal divisions protected generally by breastworks. The battle can be described in a few words. The Confederate attack on the right was mainly unsuccessful because of the breastworks, but was so gallant and persistent that Thomas called loudly for reinforcements, which were promptly sent, weakening the Federal right, until finally a gap was left. This gap Longstreet entered, and discovering, with the true instinct of a soldier, that he could do more by turning to the right, disregarded the order to wheel to the left, wheeled the other way, struck the corps of Crittenden and McCook in flank, and drove them with their commanders and the commanding general off the field.* Thomas, however, still held his ground, and, though ordered to retreat, strongly refused to do so until nightfall, thus saving the Federals from a great disaster. Longstreet, then, was the organizer of victory on the Confederate side, and Thomas the savior of the army on the other side.

Longstreet did not advance until noon, nor did he attack the breastworks on the Federal left (Thomas's position) at all, though Federal writers of the time supposed that he did. Those assaults were made first by Breckinridge and Cleburne of Hill's corps, and then by the brigades of Gist, Walthall, Govan, and others sent to their assistance. Stewart began his brilliant advance at eleven A. M., and before that time Thomas began his appeals for help.

Breckinridge moved at 9:30 A. M., and Cleburne fifteen minutes later, according to the order for attack. Forrest dismounted Armstrong's division of cavalry to keep abreast of Breckinridge, and held Pegram's division in reserve. Breckinridge's two right brigades, under Adams and Stovall, met but little opposition, but the left of Helm's brigade encountered the left of the breastworks, and was badly cut up. The heroic Helm was killed, and his command repulsed. His brigade, now under the command of that able officer, Colonel J. H. Lewis, was withdrawn. The simultaneous advance of Cleburne's troops would have greatly relieved Helm, as he was exposed to a flank as well as a direct fire. General Breckinridge suggested, and I cordially approved the suggestion, that he should wheel his two brigades to the left, and get in rear of

the breastworks. These brigades had reached the Chattanooga road, and their skirmishers had pressed past Cloud's house, where there was a Federal field-hospital. The wheel enabled Stovall to gain a point beyond the retired flank of the breastworks, and Breckinridge says in his report, "Adams had advanced still further, being actually in rear of his intrenchments. A good supporting line to my division at this moment would probably have produced decisive results." Federal reinforcements had, however, come up. Adams was badly wounded and fell into the enemy's hands, and the two brigades were hurled back. Beatty's brigade of Negley's division had been the first to come to Baird's assistance. General Thomas says:

"Beatty, meeting with greatly superior numbers, was compelled to fall back until relieved by the fire of several regiments of Palmer's reserve, which I had ordered to the support of the left, being placed in position by General Baird, and which, with the cooperation of Van Derveer's brigade of Brannan's division, and a portion of Stanley's brigade of Negley's division, drove the enemy entirely from Baird's left and rear."

General Adams was captured by Van Derveer's men. Here was quite a sensation made by Breckinridge's two thousand men. American troops cannot stand flank and rear attacks. All our fighting on the 20th could have been of that character; for a reconnoissance in the morning by our commander-in-chief would have revealed the fact that our right extended beyond the enemy's left, and a movement still farther to the right would have enabled us to turn his flank, or would have compelled him to fight outside of his breastworks.

While Breckinridge was thus alarming Thomas for his left, Cleburne was having a bloody fight with the forces behind the breastworks. From want of alignment before the battle, Deshler's brigade had to be taken out that it might not overlap Stewart. L. E. Polk's brigade soon encountered the enemy behind his logs, and after an obstinate contest was driven back. Wood's (Confederate) brigade on the left had almost reached Poe's house (the burning house) on the Chattanooga road, when he was subjected to a heavy enfilading and direct fire and driven back with great loss. (The plan of successive attacks, of course, subject the troops which drive the enemy from any position of the line to a cross-fire from those who remain in the line.) Cleburne withdrew his division four hundred yards behind the crest of a hill. The gallant young brigadier Deshler was killed while executing the movement. This brigade then fell into the able hands of Colonel R. Q. Mills. The fierce

* General Bushrod Johnson was the first to enter the gap with his division and, with the coolness and judgment for which he was always distinguished, took in the situation at a glance and

began the flank movement to the right. Longstreet adopted the plan of his lieutenant, and made his other troops correspond to Johnson's movement.—D. H. H.

fight on our right lasted until 10:30 A.M. It was an unequal contest of two small divisions against four full ones behind fortifications. It was a struggle of weakness against strength, of bare bosoms against breastworks. Surely, there were never nobler leaders than Breckinridge and Cleburne, and surely never were nobler troops led on a more desperate "forlorn hope"—against odds in numbers and superiority in position and equipment. But their unsurpassed and unsurpassable valor was not thrown away. Before a single Confederate soldier had come to their relief, Rosecrans ordered up other troops to the aid of Thomas, in addition to those already mentioned. At 10:10 A. M. General Garfield, his chief-of-staff, wrote to General McCook:

"General Thomas is being heavily pressed on the left. The general commanding directs you to make immediate dispositions to withdraw the right, so as to

spare as much force as possible to reënforce Thomas. The left must be held at all hazards, even if the right is drawn wholly back to the present left. Select a good position back this

way, and be ready to start reënforcements to Thomas at a moment's warning."

At 10:30 A. M., twenty minutes later, General Garfield wrote:

"The general commanding directs you to send two brigades of Sheridan's division, at once, with all possible dispatch, to support General Thomas and send the third brigade as soon as the lines can be drawn in sufficiently. March them as rapidly as you can, without exhausting the men."

General McCook says that he executed the order and marched the men at double-quick. This weakening of his right by Rosecrans to support his left was destined soon to be his ruin. It is noticeable, too, that so determined had been the assaults of

GENERAL JAMES A. GARFIELD, CHIEF-OF-STAFF OF GENERAL ROSECRANS. (FROM A WAR-TIME PHOTOGRAPH.)

Breckinridge and Cleburne, that though repulsed and badly punished, they were not pursued by the enemy, who did not venture outside of his works.

At eleven A. M. Stewart's division advanced under an immediate order from Bragg. His three brigades under Brown, Clayton, and Bate advanced with Wood of Cleburne's division. General Stewart says:

"For several hundred yards both lines pressed on under the most terrible fire it has ever been my fortune

to witness. The enemy retired, and our men, though mowed down at every step, rushed on at double-quick, until at length the brigade on the right of Brown broke in confusion, exposing him to an enfilade fire. He continued on, however, some fifty to seventy-five yards farther, when his two right regiments gave way in disorder, and retired to their original position. His center and left, however, followed by the gallant Clayton and the indomitable Bate, pressed on, passing the corn-field in front of the burnt house, and to a distance of two to three hundred yards beyond the Chattanooga road, driving the enemy within his line of intrenchments and passing a battery of four guns. . . . Here new batteries being opened by the enemy on our front and flank heavily supported by infantry, it became necessary to retire, the command re-forming on the ground occupied before the advance."

This was the celebrated attack upon Reynolds and Brannan which led directly to the Federal disaster. In the mean time our right was preparing to renew the attack. I proposed to the wing commander, Polk, to make a second advance, provided fresh troops were sent forward, requesting that the gap in Breckinridge's left, made by the withdrawal of Helm, should be filled by another brigade. General J. K. Jackson's was sent for that purpose, but unfortunately took its position too far in rear to engage the attention of the enemy in front, and every advance on our right during the remainder of the day was met with a flank and cross-fire from that quarter. Gist's brigade and Liddell's division of Walker's corps reported to me. Gist immediately attacked with great vigor the log-works which had re-

GENERAL GEORGE H. THOMAS.

pulsed Helm so disastrously, and he in turn was driven back. Liddell might have made as great an impression by moving on the Chattanooga road as Breckinridge had done, but his strong brigade (Walthall's) was detached, and he advanced with Govan's alone, seized the road for the second time that day, and was moving behind the breastworks, when a column of the enemy appearing on his flank and rear, he was compelled to retreat.

This was simultaneous with the advance of Stewart. The Federal commander says:

"The battle in the mean while roared with increasing fury, and approached from the left to the center. Two aides arrived successively, within a few minutes, from General Thomas, asking for reënforcements. The first was directed to say that General Negley had already gone and should be nearly at hand at that time, and that Brannan's reserve brigade was available. The other was directed to say that General Van Cleve would be sent at once to his assistance, which was accordingly

done. A message from General Thomas soon followed, saying that he was heavily pressed, the messenger informing me that General Brannan was out of line and that General Reynolds's right was exposed. Orders were sent to Wood to close upon Reynolds, and word was sent to Thomas that he should be supported, even if it took away the whole corps of McCook and Crittenden."

Brannan was between Reynolds and Wood. The order "to close upon Reynolds" was

day, Longstreet now gave the order to wheel to the right instead of the left, and thus take in reverse the strong position of the enemy. Five of McCook's brigades were speedily driven off the field. He estimates their loss at forty per cent. Certainly that flank march was a bloody one. I have never seen the Federal dead lie so thickly on the ground, save in front of the sunken wall at Fredericksburg.*

THE SNODGRASS FARM-HOUSE. (FROM A RECENT PHOTOGRAPH.)

General Thomas's headquarters on the second day were in the field this side of the house. The hills called the "Horse-shoe," made famous by the defense of Brannan and Steedman, lie on the opposite side of the house.—EDITOR.

naturally enough interpreted by Wood to support Reynolds, and not, as it seems Rosecrans meant, to close to the left. He withdrew his division and began his march to the left and in rear of Brannan. A gap was left into which Longstreet stepped with the eight brigades (Bushrod Johnson's, McNair's, Gregg's, Kershaw's, Law's, Humphreys's, Benning's, and Robertson's), which he had arranged in three lines to constitute his grand column of attack. Davis's two brigades, one of Van Cleve's, and Sheridan's entire division were caught in front and flank, and driven from the field. Disregarding the order of the

But the "disaster was not irremediable." That indomitable Virginia soldier, George H. Thomas, was there and destined to save the Union army from total rout and ruin, by confronting with invincible pluck the forces of his friend and captain in the Mexican War.† Thomas had ridden to his right to hurry up reënforcements, when he discovered a line advancing, which he thought at first was the expected succor from Sheridan, but he soon heard that it was a rebel column marching upon him. His anxiety for his left was now changing into painful alarm for his right. He chose a strong position on a spur of Mission-

* A Federal newspaper account of the time says: "The enemy pressing briskly through the interval left by Wood at once caught Sheridan and Davis in reverse and upon the flank, compelling a confused retreat. Brannan was struck upon the flank and with Van Cleve, his support, driven violently back. The latter division was not again formed on the field. . . . Swarming through the woods in confused masses, the men of Sheridan's, Davis's, and Van Cleve's divisions, with some from Brannan's, passed backward. Headquarters, which had been in rear of the position of the reserve, was caught up by the multitude and carried back. To those in the crowd the disaster appeared irremediable; apparently the whole army was in confused flight. Even

the commanding General, after a vain effort to assist the foremost of the crowd, as they came up to his position, and the commanders of the Twentieth and Twenty-first corps [McCook and Crittenden], were carried away by the living tide, and cut off from the remainder of the army."—D. H. H.

† Bragg had great respect and affection for the first lieutenant of his battery. The tones of tenderness with which he spoke of "Old Tom" are still well remembered by me.

Both of these illustrious Southerners dropped dead of heart disease: Thomas in San Francisco, in 1870, and Bragg in Galveston, in 1876. Did the strain upon them in those terrible days at Chickamauga hasten their death?—D. H. H.

THOMAS'S DIVOUAC AFTER THE FIRST DAY'S BATTLE.

ary Ridge, running east and west, placed upon it Brannan's division with portions of two brigades of Negley's; Wood's division (Crittenden's) was placed on Brannan's left. These troops, with such as could be rallied from the two broken corps, were all he had to confront the forces of Longstreet, until Steedman's division of Granger's corps came to his relief about three P. M. Well and nobly did Thomas and his gallant troops hold their own against foes flushed with past victory and confident of future success. His new line was nearly at right angles with the line of log-works on the crest side of the Rossville road, his right being an almost impregnable wall-like hill, his left nearly an inclosed fortification. The only sure hope of success against him was to get in his rear by moving far enough to our right to avoid the breastworks on his left. This was obvious to all who had been in the fight the night before, as it was then seen that our right overlapped the enemy's left.

Bushrod Johnson's three brigades in Longstreet's center were the first to fill the gap left by Wood's withdrawal from the Federal right; but the other five brigades under Hindman and Kershaw moved promptly into line as soon as space could be found for them,

wheeled to the right, and engaged in the murderous flank attack. On they rushed, shouting, yelling, running over batteries, capturing trains, taking prisoners, seizing the headquarters of the Federal commander, at the Widow Glenn's, until they found themselves facing the new Federal line on Snodgrass's Hill. Hindman had advanced a little later than the center, and had met great and immediate success. The brigades of Deas and Manigault charged the breastworks at double-quick, rushed over them, drove Laiboldt's Federal brigade of Sheridan's division off the field down the Rossville road; then General Patton Anderson's brigade of Hindman having come into line, attacked and beat back the forces of Davis, Sheridan, and Wilder in their front, killed the hero and poet General Lytle, took one thousand one hundred prisoners, twenty-seven pieces of artillery, commissary and ordnance trains, etc. Finding no more resistance on his front and left, Hindman wheeled to the right to assist the forces of the center. The divisions of Stewart, Hood, Bushrod Johnson, and Hindman came together in front of the new stronghold of the Federals.

It was now 2:30 P. M. Longstreet, with his staff, was lunching on sweet potatoes. A mes-

sage came just then that the commanding general wished to see him. He found Bragg in rear of his lines, told him of the steady and satisfactory progress of the battle, that sixty pieces of artillery had been reported captured (though probably the number was overestimated), that many prisoners and stores had been taken, and that all was going well. He then asked for additional troops to hold what ground was gained, while he pursued the two broken corps down the Dry Valley road and cut off the retreat of Thomas. Bragg replied that there was no more fight in the troops of Polk's wing, that he could give Longstreet no reinforcements, and that his headquarters would be at Reed's Bridge. He seems not to have known that the whole of Cheat-ham's division and half of Liddell's had not

GENERAL W. H. LYTLE, COMMANDING THE FIRST BRIGADE, SHERIDAN'S DIVISION, KILLED SEPTEMBER 20TH, 1863.

haul the enemy at Chattanooga or between that point and Nashville. It did not occur to me on the night of the 20th to send Bragg word of our complete success. I thought that the loud huzzas that spread over the field just at dark were a sufficient assurance and notice to any one within five miles of us. . . . Rosecrans speaks particularly of his apprehension that I would move down the Dry Valley road."

Some of the severest fighting had yet to be done after three P. M. It probably never happened before for a great battle to be fought to its bloody conclusion with the commanders of each side away from the field of conflict. But the Federals were in the hands of the indomitable Thomas, and the Confederates were under their two heroic wing-commanders.

In the lull of the strife I went with a staff-officer to examine the ground on our left. One of Helm's wounded men had been overlooked, and was lying alone in the woods, his head partly supported by a tree. He was

GENERAL J. M. BRANNAN.
(FROM A PHOTOGRAPH TAKEN IN MAY, 1865.)

been in action that day. General Longstreet wrote to me in July, 1884:

"It is my opinion that Bragg thought at three P. M. that the battle was lost, though he did not say so positively. I asked him at that time to reinforce me with a few troops that had not been so severely engaged as mine, and to allow me to go down the Dry Valley road, so as to interpose behind Thomas and cut off his retreat to Chattanooga, at the same time pursuing the troops that I had beaten back from my front. His reply, as well as I can remember, was that he had no troops except my own that had any fight left in them, and that I should remain in the position in which I then was. After telling me this, he left me, saying, 'General, if anything happens, communicate with me at Reed's Bridge.' In reading Bragg's report, I was struck with his remark that the morning after the battle 'he found the ever-vigilant General Liddell feeling his way to find the enemy.' Inasmuch as every one in his army was supposed to know on the night of the battle that we had won a complete victory, it seemed to me quite ludicrous that an officer should be commended for his vigilance the next morning in looking for the enemy in his immediate presence. I know that I was then laying a plan by which we might over-

GENERAL GORDON GRANGER. (FROM A WAR-TIME PHOTOGRAPH.)

THE OLD JOHN ROSS HOUSE AT ROSSVILLE — MISSIONARY RIDGE ON THE RIGHT. (FROM A WAR-TIME PHOTOGRAPH.)

shockingly injured. He belonged to Von Zinken's regiment, of New Orleans, composed of French, Germans, and Irish. I said to him: "My poor fellow, you are badly hurt. What regiment do you belong to?" He replied: "The Fifth Confederit, and a dommed good regiment it is." The answer, though almost ludicrous, touched me as illustrating the *esprit de corps* of the soldier—his pride in and his affection for his command. Colonel Von Zinken told me afterwards that one of his desperately wounded Irishmen cried out to his comrades, "Charge them, boys; they have cha-ase (cheese) in their haversacks." Poor Pat, he has fought courageously in every land in quarrels not his own.

Hindman and Johnson organized a column of attack upon the front and rear of the stronghold of Thomas. It consisted of the brigades of Deas, Manigault, Gregg, Anderson, and McNair. Three of the brigades, Johnson says, had each but five hundred men, and the other two were not strong. Deas was on the north side of the gorge through which the Crawfish road crosses, Manigault across the gorge and south, on the crest parallel to the Snodgrass Hill, where Thomas was. The other three brigades extended along the crest with their faces north, while the first two faced east.

Kershaw, with his own and Humphreys's brigade, was on the right of Anderson and was to coöperate in the movement. It began at 3:30 P. M. Hindman says:

GENERAL T. C. HINDMAN, C. S. A.

"In a few minutes a terrific contest ensued, which continued at close quarters, without any intermission, over four hours. Our troops attacked again and again with a courage worthy of their past achievements. The enemy fought with determined obstinacy and repeatedly repulsed us, but only to be again assailed. As showing the fierceness of the fight, I mention the fact that on our extreme left the bayonet was used, and men also killed and wounded with clubbed muskets. A little after four, the enemy was reënforced, and advanced with loud shouts upon our right, but was repulsed by Anderson and Kershaw."

General Bushrod Johnson pays a similar tribute to the gallantry of the combatants on both sides, but claims that his men were surely, if slowly, gaining ground at all points, which must have made untenable the stronghold of Thomas. Relief was, however, to come to our men so hotly engaged on the left, by the advance of the right. At three P. M. Forrest reported to me that a strong column was approaching from Rossville, which he was delaying all he could. From prisoners we soon learned that it was Granger's corps. We were apprehensive that a flank attack, by fresh troops, upon our exhausted and shattered ranks might prove fatal. Major-General Walker strongly advised falling back to the position of Cleburne, but to this I would not consent, believing that it would invite attack, as we were in full view.* Cheatham's fine division was sent to my assistance by the wing-commander. But Granger, who had gallantly marched without orders to the relief of Thomas, moved on to the "sound of the firing." Rosecrans thus describes the timely help afforded by Granger to the sorely beset Thomas:

"Arrived in sight, Granger discovered at once the peril and the point of danger—the gap—and quick as thought he directed his advance brigade upon the enemy. General Steedman, taking a regimental color, led the column. Swift was the charge and terrible the conflict, but the enemy was broken. A thousand of our brave men killed and wounded paid for its possession."

According to the official returns the entire loss during the afternoon in Steedman's two brigades [including 613 captured or missing] was 1787. A Federal writer says that of the eight staff-officers of Brigadier-General Whitaker "three were killed, three wounded, and one killed or captured."

Longstreet was determined to send Preston with his division of three brigades under Gracie, Trigg, and Kelly, aided by Robertson's brigade of Hood's division, to carry the heights—the main point of defense. His troops were of the best material and had been in reserve all day; but brave, fresh, and strong

as they were, it was with them alternate advance and retreat, until success was assured by a renewal of the fight on the right. At 3:30 P. M. General Polk sent an order to me to assume command of the attacking forces on the right and renew the assault. Owing to a delay in the adjustment of our line, the advance did not begin until four o'clock. The men sprang to their arms with the utmost alacrity, though they had not heard of Longstreet's success, and they showed by their cheerfulness that there was plenty of "fight in them." Cleburne ran forward his batteries, some by hand, to within three hundred yards of the enemy's breastworks, pushed forward his infantry, and carried them. J. K. Jackson had a bloody struggle with the fortifications in his front, but had entered them when Cheatham with two of his brigades, Maney's and Wright's, came up with shouts and cheers. Breckinridge and Walker met with but little opposition until the Chattanooga road was passed, when their right was unable to overcome the forces covering the enemy's retreat. As we passed into the woods west of the road, it was reported to me that a line was advancing at right angles to ours. I rode to the left to ascertain whether they were foes or friends, and soon recognized General Buckner. The cheers that went up when the two wings met were such as I had never heard before, and will never hear again.

Preston gained the heights a half hour later, capturing a thousand prisoners and four thousand five hundred stand of arms. But neither right nor left is entitled to the laurels of a complete triumph. It was the combined attack which, by weakening the enthusiasm of the brave warriors who had stood on the defense so long and so obstinately, won the day.

Thomas had received orders after Granger's arrival to retreat to Rossville, but, stout soldier as he was, he resolved to hold his ground until nightfall. An hour more of daylight would have insured his capture. Thomas had under him all the Federal army, except the six brigades which had been driven off by the left wing.

In regard to the relative strength of the two armies, Colonel Archer Anderson says:

"From an examination of the original returns in the War Department, I reckon, in round numbers, the Federal infantry and artillery on the field at fifty-nine thousand, and the Confederate infantry and artillery at fifty-five thousand. The Federal Cavalry, about ten thousand strong, was outnumbered by the Confederates by a thousand men. Thus speak the returns. Perhaps a deduction of five thousand men from the reported strength of each army would more nearly represent the actual strength of the combatants. But in any case

* Major-General Walker claims that he proposed to me to make this movement with his whole corps, and complains that his command was disintegrated by sending it in by brigades.

General Walker did propose, as he says, to fall back and align upon Cleburne, when we saw Granger's corps approaching on our right, and I did refuse to permit this, believing that a withdrawal in full view of Granger would invite an attack upon

our flank, and this might be fatal to troops more or less demoralized by the bloody repulse which they had sustained. The proposal to advance with his whole corps was never heard by me, and was, at best, impossible, as two of his five brigades had been detached, the one by General Polk and the other by myself, to fill gaps in the line.

it is, I think, certain that Rosecrans was stronger in infantry and artillery than Bragg by at least four thousand men."

It is difficult to make a correct estimate of the casualties on the Confederate side, as so many official papers were never published. My corps had "present for duty" 8884 men the morning of the 19th. The casualties were: killed, 370; wounded, 2448; missing, 172,—total, 2990. Among the killed were two brigadier-generals. Proportionally, this would give a loss in Bragg's army of 18,000 men. [The official estimate, War Records office, is 17,804.—ED.] But the right wing suffered very much more than the left, because it fought all the time against a foe under cover. (The only general officers killed were in the right wing.) For the same reason the right wing inflicted much less injury upon the enemy than did the left—hardly half as much. It would be a high estimate to put our casualties at 15,000 in artillery and infantry.

The Federal estimate of their loss (revised official returns) is: killed, 1656; wounded, 9749; captured or missing, 4774,—total, 16,179. The estimate of "missing" is below the mark by one thousand, if the Confederate claim of the capture of 6500 prisoners is correct. The Confederates also claim to have taken 51 pieces of artillery, 15,000 stand of arms, and a large amount of ordnance stores, camp equipage, etc.

But whatever blunders each of us in authority committed before the battles of the 19th and 20th, and during their progress, the great blunder of all was that of not pursuing the enemy on the 21st. The day was spent in

burying the dead and gathering up captured stores. Forrest, with his usual promptness, was early in the saddle, and saw that the retreat was a rout. Disorganized masses of men were hurrying to the rear; batteries of artillery were inextricably mixed with trains of wagons; disorder and confusion pervaded the broken ranks struggling to get on. Forrest sent back word to Bragg that "every hour was worth a thousand men." But the commander-in-chief did not know of the victory until the morning of the 21st, and then he did not order a pursuit. Rosecrans spent the day and the night of the 21st in hurrying his trains out of town. A breathing space was allowed him; the panic among his troops subsided, and Chattanooga—the objective point of the campaign—was held. There was no more splendid fighting in '61, when the flower of the Southern youth was in the field, than was displayed in those bloody days of September, '63. But it seems to me that the *elan* of the Southern soldier was never seen after Chickamauga—that brilliant dash which had distinguished him on a hundred fields was gone forever. He was too intelligent not to know that the cutting in two of Georgia meant death to all his hopes. He knew that Longstreet's absence was imperiling Lee's safety, and that what had to be done must be done quickly. The delay to strike was exasperating to him; the failure to strike after the success was crushing to all his longings for an independent South. He fought stoutly to the last, but, after Chickamauga, with the sullenness of despair and without the enthusiasm of hope. That "barren victory" sealed the fate of the Southern Confederacy.

D. H. Hill.

MEMORANDA ON THE CIVIL WAR.

The Reserve Corps at Chickamauga.

BY GENERAL GORDON GRANGER'S CHIEF OF STAFF.

ON the 19th day of September, 1863, the Reserve Corps of the Army of the Cumberland, General Gordon Granger in command, was distributed over a long stretch of country, its rear at Murfreesboro' and its van on the battle-field of Chickamauga. Here were W. C. Whitaker's and J. G. Mitchell's brigades, and the Twenty-second Michigan and Eighty-ninth Ohio regiments, all of the First Division, under immediate command of Brigadier-General James B. Steedman; Colonel Daniel McCook's brigade of infantry, and Colonel Minty's brigade of cavalry, the whole being under command of Major-General Gordon Granger, the corps commander. These troops had been posted to cover the rear and left flank of the army. During September 19th, the first day of the battle, they were engaged in some skirmishing and stood at arms expecting an attack. On the evening of the 19th every indication pointed to a renewal of the battle early the

next day. The night was cold for that time of year. Tell-tale fires were prohibited. The men slept on their arms. All was quiet save in the field-hospitals in the rear. The bright moon lighted up the fields and woods. Along the greater part of a front of eight miles the ground was strewn with the intermingled dead of friend and foe. The morning of Sunday, the 20th, opened with a cloudless sky, but a fog had come up from the warm water of the Chickamauga and hung over the battle-field until nine o'clock. The expected attack on Granger was not made. A silence of desertion was in the front. This quiet continued till nearly ten o'clock; then, as the peaceful tones of church bells, rolling over the land from the East, reached the meridian of Chickamauga, they were made dissonant by the murderous roar of the artillery of Bishop Polk, who was opening the battle on Thomas's front. Granger, who had been ordered, at all hazards, to hold fast where he was to protect the left flank and rear of the army, listened and grew impatient. Shortly before ten o'clock, calling my attention to a great column of

dust moving from our front towards the point from which came the sound of battle, he said, "They are concentrating over there. That is where we ought to be." The corps flag marked his headquarters in an open field near the Ringgold road. He walked up and down in front of his flag, nervously pulling his beard. Once stopping, he said, "Why, the —— does Rosecrans keep me here? There is nothing in front of us now. There is the battle" — pointing in the direction of Thomas.

Every moment the sounds of battle grew louder, while the many columns of dust rolling together here mingled with the smoke that hung over the scene.

At eleven o'clock, with Granger, I climbed a high hayrick near by. We sat there for ten minutes listening and watching. Then Granger jumped to his feet, thrust his glass into its case, and exclaimed with an oath:

"I am going over to Thomas, orders or no orders."

"And if you go," I replied, "it may bring disaster to the army and you to a court-martial."

"There's nothing in our front now but ragtag, bob-tail cavalry," he replied. "Don't you see Bragg is piling his whole army on Thomas! I am going to his assistance."

We quickly climbed down the rick, and, going to Steedman, Granger ordered him to move his command "over there," pointing towards the place from which came the sounds of battle. Colonel Dan McCook was directed to hold fast at McAfee Church, where his brigade covered the Ringgold road. Before half-past eleven o'clock Steedman's command was in motion. Granger, with his staff and escort, rode in advance. Steedman, after accompanying them a short distance, rode back to the head of his column.

Thomas was nearly four miles away. The day had now grown very warm, yet the troops marched rapidly over the narrow road, which was covered ankle-deep with dust that rose in suffocating clouds. Completely enveloped in it, the moving column swept along like a desert sandstorm. Two miles from the point of starting, and three-quarters of a mile to the left of the road, the enemy's skirmishers and a section of artillery opened fire on us from an open wood. This force had worked round Thomas's left, and was then partly in his rear. Granger halted to feel them. Soon becoming convinced that it was only a large party of observation, he again started his column and pushed rapidly forward. I was then sent to bring up Colonel McCook's brigade, and put it in position to watch the movements of the enemy; to keep open the Lafayette road, and to cover the open fields between that point and the position held by Thomas. This brigade remained there the rest of the day. Our skirmishers had not gone far when they came upon Thomas's field-hospital, at Cloud's house, then swarming with the enemy, who were helping themselves to everything portable. They came from the same body of Forrest's cavalry that had fired on us from the wood. They were quickly driven out, and our men were warmly welcomed with cheers from hundreds of dying and wounded men.

A little farther on, we were met by a staff-officer sent by General Thomas to discover whether we were friends or enemies; he did not know whence friends were coming — the enemy appeared to be approaching

from all directions. Bragg's whole army was rolling up against the heroic troops of this grand soldier. All of the shattered Army of the Cumberland left on the field was with Thomas; but not more than one-fourth of the men of the army who went into battle at the opening were there. Thomas's loss in killed and wounded during the two days had been dreadful. As his men dropped out his line was contracted. It was hardly half as long as it had been. Now its flanks were bent back, conforming to ridges shaped like a horseshoe.

On the part of Thomas and his men there was no thought but that of fighting. He was a soldier who had never retreated, who had never been defeated. He stood immovable, the "Rock of Chickamauga." Where he was, timid men became brave. Never had soldiers greater love for a commander. He imbued them with his spirit, and their confidence in him was sublime.

To the right of Thomas's line — his extreme right being composed of Brannan's fragments on the Snodgrass hill — was a gorge, then a high ridge, nearly at right angles thereto, running east and west. Confederates under Kershaw (McLaws's division of Hood's corps) were passing through the gorge, together with Bushrod Johnson's division, which Longstreet was strengthening with Hindman's division; divisions were forming on this ridge for an assault; to their left the guns of a battery were being unlimbered for an enfilading fire. There was not a man to send against the force on the ridge, none to oppose this impending assault. The enemy saw the approaching colors of the Reserve Corps and hesitated.

At one o'clock Granger shook hands with Thomas. Something was said about forming to fight to the right and rear.

"Those men must be driven back," said Granger, pointing to the gorge and ridge. "Can you do it?"

"Yes," was the reply. "My men are fresh, and they are just the fellows for that work. They are raw troops, and they don't know any better than to charge up there."

Granger quickly sent Aleshire's battery of three-inch rifle guns which he brought up to Thomas's left to assist in repelling another assault about to be made on the Kelly farm front. Whitaker's and Mitchell's brigades under Steedman were whirled into position and projected against the enemy in the gorge and on the ridge. With ringing cheers they advanced in two lines by double-quick. Over open fields, through weeds waist-high, through a little valley, then up the ridge. The enemy opened on them first with artillery, then with a murderous musketry fire. When well up the ridge the men, almost exhausted, were halted for breath. They lay on the ground two or three minutes, then came the command "Forward." Brave, bluff old Steedman, with a regimental flag in his hand, led the way. On went the lines, firing as they ran and bravely receiving a deadly and continuous fire from the enemy on the summit. The horrible din from muskets and the scarcely intermittent roar of the artillery drowned the voice of command. The Confederates began to break, and in another minute they were flying down the southern slope of the ridge. In twenty minutes from the beginning of the charge the ridge had been carried.

Granger's hat had been torn by a fragment of shell; Steedman had been wounded; Whitaker had been wounded, and four of his five staff-officers killed or mortally wounded. Twenty per cent. of Steedman's

two brigades, numbering 3500 muskets, had been killed and wounded in that twenty minutes; and the end was not yet.

The enemy massed a force to retake the ridge. They came before our men had rested; twice they assaulted and were driven back. During one assault, as the first line came within range of our muskets, it halted, apparently hesitating, when we saw a colonel seize a flag, wave it over his head, and rush forward. The whole line instantly caught his enthusiasm, and with a wild cheer followed, only to be hurled back again. Our men ran down the ridge in pursuit. In the midst of a group of Confederate dead and wounded they found the brave colonel dead, the flag he carried spread over him where he fell.

Soon after five o'clock Thomas rode to the left of his line, leaving Granger, the ranking officer, at the center. The ammunition of both Thomas's and Granger's commands was now about exhausted. When Granger had come up he had given ammunition to Brannan and Wood, and that had exhausted his supply. The cartridge-boxes of both our own and the enemy's dead within reach had been emptied by our men. When it was not yet six o'clock, and Thomas was still on the left of his line, Brannan rushed up to Granger, saying, "The enemy are forming for another assault; we have not another round of ammunition—what shall we do?" "Fix bayonets and go for them," was the reply. Along the whole line ran the order, "Fix bayonets." On came the enemy—our men were lying down. "Forward" was sounded. In one instant they were on their feet. Forward they went to meet the charge. When bayonet meets bayonet, one side gives way. The enemy fled. So impetuous was this counter-charge that one regiment of the Reserve Corps, with empty muskets and empty cartridge-boxes, broke through the enemy's line, which, closing up in their rear, carried it off as in the undertow.

One more feeble assault was made by the enemy; then the day closed, and the battle of Chickamauga was over. Of the 3700 men of the Reserve Corps who went into the battle that afternoon, 1175 were killed and wounded, 613 were missing, all prisoners, many of whom were of the regiment that broke through the lines. Our total loss, 1788, nearly fifty per cent. lost in one afternoon.

Gordon Granger was rough in manner, but he had a tender heart. He was not a respecter of persons. He was rather inclined to insubordination. This was especially so when he knew his superior officer to be wrong. Otherwise he was a splendid soldier. Rosecrans named him well when he wrote of him, "Granger, great in battle."

J. S. Fullerton.

ST. LOUIS, Jan. 20, 1887.

General Polk at Chickamauga.

BY HIS SON, CAPTAIN POLK, OF HIS STAFF.

IN response to your request for the reasons given by General Polk for the delay in attack on the morning of Sept. 20, 1863, let me say that it was because General Hill's corps was not ready for the assault. General Polk sent General Hill an order at midnight to attack at daylight, but General Hill could not be found (either on his line of battle or at Tedford's Ford, where

his headquarters were reported to be). Upon learning this fact General Polk issued an order, dated 5:30 A. M., direct to Hill's division commanders to attack as soon as they could get into position. This second order was delivered in the presence of General Hill by Captain Wheless soon after sunrise, about 6:15. To this General Hill replied that his men were getting rations and that he would not be ready to move for an hour or more. General Polk reported this reply to General Bragg, in a note dated seven A. M., and stated that the attack would be made as soon as General Hill was ready. This, of course, conflicts with the time given by General Hill for the reception of the second order, viz., 7:25 A. M. These facts are derived from the official statements of General Polk, Captain Wheless, and of John H. Fisher, on file in the War Records office.

As to the whereabouts of General Polk on the morning of the 20th, General Polk left his camp at Alexander's Bridge, 1200 yards in rear of his line, between daylight and sunrise, and, as is shown by the statement of General Cheatham (Official Records), was on the line of battle at sunrise, where he remained and where he first met General Bragg (Captain Wheless, Official Records). These facts I state from my personal knowledge.

General Bragg's statement that General Polk was away from his line of battle at this time was not derived from his own knowledge, but from a statement of one of his staff-officers, as is shown in the following extract from an unpublished private letter from General Bragg, dated Mobile, February 8, 1873.

"The staff-officer sent to General Polk (Major Lee, A. I. G.) to urge his compliance with the orders of the previous night, reported to me that he found him at a farmhouse, three miles from the line of his troops, about one hour after sunrise, sitting on the gallery reading a newspaper, and waiting, as he (the general) said, for his breakfast."

The facts of the records above quoted are a sufficient answer to this absurd statement. But I can add further that I saw Major Lee when he delivered General Bragg's message to General Polk, at his (Polk's) camp in the woods, at Alexander's Bridge, 1200 yards from his line, before sunrise. General Polk was then preparing to mount his horse.

I will also add of my own knowledge that General Polk had ridden from one end of his line to the other, and had met General Hill and each of the division commanders before General Bragg came upon his line of battle. They met on the line about 7:45 A. M.

You inquire also about "the attack on the 13th." The object of Polk's movement was to intercept Crittenden before he should cross to the west side of the Chickamauga, and unite with other portions of Rosecrans's army. Polk was told that he would find Crittenden east of the creek about Pea Vine Church on the Graysville road, and was directed to attack him there at daylight of the 13th. He moved as ordered and found no enemy, Crittenden having crossed to the west of the creek the evening before. General Bragg in his report neglects to take this fact into account, and thus leaves the impression that Crittenden's escape was due to Polk's tardiness in moving rather than to his own tardiness in ordering the movement. It should have been ordered for the morning of the 12th.

W. M. Polk.

TOPICS OF THE TIME.

Lincoln and Lowell.

"But democracies have likewise their finer instincts. I have also seen the ablest statesman and most pregnant speaker of our generation, a man of humble birth and ungainly manners, of little culture beyond what his own genius supplied, become more absolute in power than any monarch of modern times through the reverence of his countrymen for his honesty, his wisdom, his sincerity, his faith in God and man, and the nobly humane simplicity of his character."

The reprint in Lowell's latest volume, of his Birmingham address on "Democracy," containing the above tribute,—one of the most complete and satisfactory summaries of character ever packed into the very pith of prose,—reminds us that James Russell Lowell was the first of the leading American writers to see clearly and fully, and clearly, fully, and enthusiastically proclaim the greatness of Abraham Lincoln.

The allusion to the martyr-president in "The Commemoration Ode" (some of whose lines were given in fac-simile in connection with the portrait in our November number) was in its nature prophetic,—because it presented a view of the President to which the world is only now fully awakening.

"Such was he, our Martyr-Chief,
Whom late the Nation he had led,
With ashes on her head,
Wept with the passion of an angry grief;
Forgive me, if from present things I turn
To speak what in my heart will beat and burn,
And hang my wreath on his world-honored urn.
Nature, they say, doth dote,
And cannot make a man
Save on some worn-out plan,
Repeating us by rote:
For him her Old World molds aside she threw,
And, choosing sweet clay from the breast
Of the unexhausted West,
With stuff untainted shaped a hero new,
Wise, steadfast in the strength of God, and true.
How beautiful to see
Once more a shepherd of mankind indeed,
Who loved his charge, but never loved to lead;
One whose meek flock the people joyed to be,
Not lured by any cheat of birth,
But by his clear-grained human worth,
And brave old wisdom of sincerity!
They knew that outward grace is dust;
They could not choose but trust
In that sure-footed mind's unfaltering skill,
And supple-tempered will
That bent like perfect steel to spring again and thrust.
His was no lonely mountain-peak of mind,
Thrusting to thin air o'er our cloudy bars,
A sea-mark now, now lost in vapors blind;
Broad prairie rather, genial, level-lined,
Fruitful and friendly for all human kind,
Yet also nigh to heaven and loved of loftiest stars.
Nothing of Europe here,
Or, then, of Europe fronting mornward still,
Ere any names of Serf and Peer
Could Nature's equal scheme deface;
Here was a type of the true elder race,
And one of Plutarch's men talked with us face to face.
I praise him not; it were too late;
And some innate weakness there must be
In him who condescends to victory
Such as the Present gives, and cannot wait,
Safe in himself as in a fate.
So always firmly he:
He knew to bide his time,
And can his fame abide,
Still patient in his simple faith sublime,
Till the wise years decide.
Great captains, with their guns and drums,
Disturb our judgment for the hour,
But at last silence comes;
These all are gone, and, standing like a tower,

Our children shall behold his fame,
The kindly-earnest, brave, foreseeing man,
Sagacious, patient, dreading praise, not blame,
New birth of our new soil, the first American."

This portrait of "the first American" leaves scarce any detail for the future poet to dwell upon,—so remarkable is the passage for its sympathy and penetration, as well as for the beauty, tenderness, and dignity of its cadences. If Lowell had only linked his name with that of his immortal subject in such immortal verse he would deserve the congratulations and thanks of his fellow-countrymen.

But Lowell has done more than this. In the very thick and fury of the struggle for the salvation of the nation,—a struggle, be it remembered, not only of arms, but of intellects as well,—he came out in "The North American Review" (of which he was one of the editors), not with the usual patriotic flag-waving of that time, but with a full, statesmanlike, and characteristically witty and eloquent essay in support of the policy of the Administration, an essay including an estimate of Lincoln's character which, when read in the light of subsequent history, has more of the tinge of prophecy than even the "Ode." In an article in "The Atlantic Monthly" for July, 1862, Hawthorne had written of the President with a respect which is all the more creditable when one remembers how opposite in politics they had hitherto always been. From Hawthorne's article "Chiefly about War Matters," we quote the following passage:

"Good Heavens! what liberties have I been taking with one of the potentates of the earth, and the man on whose conduct more important consequences depend than on that of any other historical personage of the century! But with whom is an American citizen entitled to take a liberty, if not with his own chief magistrate? However, lest the above allusions to President Lincoln's little peculiarities (already well known to the country and to the world) should be misinterpreted, I deem it proper to say a word or two, in regard to him, of unfeigned respect and measurable confidence. He is evidently a man of keen faculties, and, what is still more to the purpose, of powerful character. As to his integrity, the people have that intuition of it which is never deceived. Before he actually entered upon his great office, and for a considerable time afterwards, there is no reason to suppose that he adequately estimated the gigantic task about to be imposed on him, or, at least, had any distinct idea how it was to be managed; and I presume there may have been more than one veteran politician who proposed to himself to take the power out of President Lincoln's hands into his own, leaving our honest friend only the public responsibility for the good or ill success of the career. The extremely imperfect development of his statesmanly qualities, at that period, may have justified such designs. But the President is teachable by events, and has now spent a year in a very arduous course of education; he has a flexible mind, capable of much expansion, and convertible towards far loftier studies and activities than those of his early life; and if he came to Washington a backwoods humorist, he has already transformed himself into as good a statesman (to speak moderately) as his prime-minister."—Vol. x., p. 47.

Before coming to Mr. Lowell's "North American" essay, we wish to refer to an article by the same writer on "The Election in November," published in "The Atlantic" for October, 1860 (the month before Lincoln's election), in which the political situation is summarized

and the question of slavery discussed with a breadth, a penetration, and a humor that make the paper worthy of permanent preservation among his writings. In this essay Mr. Lowell says that Lincoln "has proved both his ability and his integrity; he has had experience enough in public affairs to make him a statesman, and not enough to make him a politician."

In quoting, now, from Mr. Lowell's "North American" essay we go back of the condensed reprint in "My Study Windows" (entitled "Abraham Lincoln") to the "Review" article on "The President's Policy" written in 1863 and printed in the number for January, 1864.

"That a steady purpose and a definite aim have been given to the jarring forces which, at the beginning of the war, spent themselves in the discussion of schemes which could only become operative, if at all, after the war was over; that a popular excitement has been slowly intensified into an earnest national will; that a somewhat impracticable moral sentiment has been made the unconscious instrument of a practical moral end; that the treason of covert enemies, the jealousy of rivals, the unwise zeal of friends, have been made not only useless for mischief, but even useful for good; that the conscientious sensitiveness of England to the horrors of civil conflict has been prevented from complicating a domestic with a foreign war: all these results, any one of which might suffice to prove greatness in a ruler, have been mainly due to the good sense, the good humor, the sagacity, the large-mindedness, and the unselfish honesty of the unknown man whom a blind fortune, as it seemed, had lifted from the crowd to the most dangerous and difficult eminence of modern times. It is by presence of mind in untried emergencies that the native metal of a man is tested; it is by the sagacity to see, and the fearless honesty to admit, whatever of truth there may be in an adverse opinion, in order more convincingly to expose the fallacy that lurks behind it, that a reasoner at length gains for his mere statement of a fact the force of argument; it is by a wise forecast which allows hostile combinations to go so far as by the inevitable reaction to become elements of his own power, that a politician proves his genius for state-craft; and especially it is by so gently guiding public sentiment that he seems to follow it, by so yielding doubtful points that he can be firm without seeming obstinate in essential ones, and thus gain the advantages of compromise without the weakness of concession, by so instinctively comprehending the temper and prejudices of a people as to make them gradually conscious of the superior wisdom of his freedom from temper and prejudice,—it is by qualities such as these that a magistrate shows himself worthy to be chief in a commonwealth of freemen. And it is for qualities such as these that we firmly believe History will rank Mr. Lincoln among the most prudent of statesmen and the most successful of rulers. If we wish to appreciate him, we have only to conceive the inevitable chaos in which we should now be weltering, had a weak man or an unwise one been chosen in his stead.

"... And certainly no one ever entered upon office with so few resources of power in the past, and so many materials of weakness in the present, as Mr. Lincoln. Even in that half of the Union which acknowledged him as President, there was a large and at that time dangerous minority that hardly admitted his claim to the office, and even in the party that elected him there was also a large minority that suspected him of being secretly a communicant with the church of Laodicea. All that he did was sure to be virulently attacked as ultra by one side; all that he left undone, to be stigmatized as proof of lukewarmness and backsliding by the other. Meanwhile he was to carry on a truly colossal war by means of both; he was to disengage the country from diplomatic entanglements of unprecedented peril undisturbed by the help or the hindrance of either, and to win from the crowning dangers of his administration, in the confidence of the people, the means of his safety and their own. He has contrived to do it, and perhaps none of our Presidents since Washington has stood so firm in the confidence of the people as he does after three years of stormy administration.

"... Time was his prime-minister and, we began to

think at one period, his general-in-chief also. At first he was so slow that he tired out all those who see no evidence of progress but in blowing up the engine; then he was so fast that he took the breath away from those who think there is no getting on safely while there is a spark of fire under the boilers. . . . Mr. Lincoln, as it seems to us, in reviewing his career, though we have sometimes in our impatience thought otherwise, has always waited, as a wise man should, till the right moment brought up all his reserves. *Semper nocuit differre paratis* is a sound axiom, but the really efficacious man will also be sure to know when he is *not* ready, and be firm against all persuasion and reproach till he is.

"One would be apt to think, from some of the criticisms made on Mr. Lincoln's course by those who mainly agree with him in principle, that the chief object of a statesman should be rather to proclaim his adhesion to certain doctrines, than to achieve their triumph by quietly accomplishing his ends. In our opinion, there is no more unsafe politician than a conscientiously rigid *doctrinaire*, nothing more sure to end in disaster than a theoretic scheme of policy that admits of no pliability for contingencies. . . . Mr. Lincoln's perilous task has been to carry a rather shakily craft through the rapids, making fast the unrulier logs as he could snatch opportunity, and the country is to be congratulated that he did not think it his duty to run straight at all hazards, but cautiously to assure himself with his setting-pole where the main current was, and keep steadily to that. He is still in wild water, but we have faith that his skill and sureness of eye will bring him out right at last."

Not the least interesting part of the essay is the author's comparison of Henry IV. of France with the American President,—before the assassination of Lincoln had completed a certain likeness in their careers. "Henry went over to the nation; Mr. Lincoln has steadily drawn the nation over to him. One left a united France; the other, we hope and believe, will leave a reunited America."

We are yet to quote, however, what is perhaps the most remarkable and prophetic portion of the essay. The very phraseology of the paragraph which closes the essay has such a similarity to recent utterances that one can hardly believe that it was written twenty-four years ago, and at a time when, though there had been notable Union victories, the issue was still far from being determined. Not only did Lowell thus early recognize the peculiar genius and the dominance of Lincoln, not only did he predict the triumph of the national cause, but he foresaw, in the midst of strife and bitterness, a near future of unprecedented harmony and prosperity. Never in the history of the world has internecine strife been followed so quickly by reconciliation; never before has a reunited nation more suddenly risen to the very height of material well-being and power. It is now a familiar history; but when Mr. Lowell wrote it down it was all yet beneath the veil of the future, only to be penetrated by the pure eyes of faith and inspiration:

"The danger of slavery has always been in the poor whites of the South; and wherever freedom of the press penetrates,—and it always accompanies our armies,—the evil thing is doomed. Let no one who remembers what has taken place in Maryland and Missouri think such anticipations visionary. The people of the South have been also put to school during these three years, under a sharper schoolmistress, too, than even ours has been, and the deadliest enemies of slavery will be found among those who have suffered most from its indirect evils. It is only by its extinction—for without it no secure union would be possible—that the sufferings and losses of the war can be repaid. That extinction accomplished, our wounds will not be long in healing. Apart from the slaveholding class, which is numerically small, and would be socially insignificant without its privileges, there are no such mutual antipathies between

the two sections as the conspirators, to suit their own purposes, have asserted, and even done their best to excite. We do not like the Southerners less for the gallantry and devotion they have shown even in a bad cause, and they have learned to respect the same qualities in us. There is no longer the nonsensical talk about Cavaliers and Puritans, nor does the one gallant Southron any longer pine for ten Yankees as the victims of his avenging steel. As for subjugation, when people are beaten they are beaten, and every nation has had its turn. No sensible man in the North would insist on any terms except such as are essential to assure the stability of peace. To talk of the South as our future Poland is to talk without book; for no region rich, prosperous, and free could ever become so. It is a geographical as well as a moral absurdity. With peace restored, slavery rooted out, and harmony sure to follow, we shall realize a power and prosperity beyond even the visions of the Fourth-of-July orator, and we shall see Freedom, while she proudly repairs the ruins of war, as the Italian poet saw her,—

* "Girar la Libertà mirai
E baciâr lieta ogni ruina e dire
Ruine sì ma servitù non mai."

It is a pleasure to know that Mr. Lincoln had the satisfaction of reading the "North American" essay. As it was, according to the custom of the day, unsigned, he wrote to the publishers, instead of to the author, concerning a certain point in his policy which had been criticised and which he wished to explain. This letter, which was dated January 16, 1864, appeared in the next number of the Review. It was characteristic of Lincoln to think only of the benefit of so notable a demonstration in favor of the cause to which his life was dedicated. "Of course," said the President, "I am not the most impartial judge; yet, with due allowance for this, I venture to hope that the article entitled 'The President's Policy' will be of value to the country." How like him to add—"I fear I am not quite worthy of all which is therein said of me personally."

Several of the leading American poets have shown their appreciation of Lincoln in verse or prose—either during his life or since his tragic death. Indeed, an interesting study could be made of the tributes and allusions to the great Liberator by the principal writers of the country. Such a study would not omit mention of Stedman's sonnet on Lincoln's death, and his poem on the cast of Lincoln's hand, a part of which was reprinted in the December CENTURY, of Dr. Holmes's memorial hymn, of Whitman's two poems on the death of Lincoln, or of Stoddard's stately and pathetic ode, and his sonnet published ten years ago in THE CENTURY. During the war the relations of Bryant with Lincoln were, perhaps, more important than those of any other of our poets with the President. Bryant had met him first when Lincoln was a Captain in the Black Hawk war,—and had presided at the Cooper Union meeting where the Western statesman delivered his now famous speech. Lincoln was Bryant's choice as a candidate as against Seward, and in personal interview as well as by letter and editorial, he encouraged, advised, and criticised the Lincoln administration throughout its existence. At Lincoln's death Bryant wrote the noble threnody which is familiar to all readers of American poetry. But we think it will be found that the literary record of Lowell in connection with Lincoln is more remarkable than that of any other of the distinguished authors of America.

* "I beheld Liberty go 'round,
Kiss every ruin joyfully, and say
'Ruins, if so must be, but Slavery never.'"

The Injustice of Socialism.

SOCIALISTS themselves maintain that their system alone is equitable, and that the present industrial methods are all wrong, since they lead necessarily to inequality in wealth and power and in the means of happiness. The object of socialism is to put an end to these inequalities, and to found a society in which all would fare as nearly as possible alike; and this, as socialists maintain, would be truly equitable and just. But when we inquire into the fundamental principles of their system, we find the element of justice conspicuously absent. Their main principles are the ownership of all means of production by the State, and the payment of all workmen according to what is assumed to be the rule of justice. This rule is expressed in the formula with which all students of the subject are familiar, "from each according to his ability, to each according to his needs." According to this rule, a man of superior talents or creative genius would receive no higher recompense than the most inefficient workman, and, indeed, if the latter had a larger family, he would apparently receive more. The obvious intent of this rule is to prevent men of superior abilities from rising above the mass; and socialists proclaim that the privileges of higher intelligence must fall with the privileges of wealth and birth.

Such being the law of recompense in the socialistic system, let us see how it accords with the principles of justice as commonly understood among men. To determine this, we must inquire how a man would be recompensed for his labor if he worked all alone for himself. Suppose a man on a desert island, like Robinson Crusoe, with no goods of any kind except what he could cull from the bosom of Nature or produce by his unassisted labor. In this case it is plain that his wealth and prosperity would depend on the ability and energy with which he worked. If he tilled twice as much ground, he would raise twice as large a crop; if he contrived a way to kill game, he would have its flesh to eat; if he laid by a store of food for the winter season, he would have enough to eat, and if he did not, he would suffer and perhaps die of hunger; if he invented tools of various kinds, he could produce vastly more goods for his own use than he could without them; and, in short, the rewards of his industry would depend on the intelligence and enterprise with which he labored in his own behalf. If we suppose two or more men, each living on his own island, their comparative gains would depend partly, indeed, on the natural resources of the several islands, but mainly on the comparative skill and energy of the men themselves. This truth is abundantly illustrated in the life of nations. Why are Americans and Englishmen richer and more prosperous than Russians and Turks, and these latter more prosperous than Hottentots and Maoris? Clearly because of the greater intelligence and skill and the higher moral qualities of the more prosperous races; so that both of individuals and of nations it is true that, when working in their own behalf, they are recompensed according to their abilities, and not according to their needs.

Since a man is recompensed according to his ability when working for himself, he ought to be recompensed on the same principle when he works for society; for

otherwise he will be deprived of the natural reward of his labors. On the other hand, society itself would suffer an injustice if it paid the incompetent or inefficient workman a large salary simply because he had a large family dependent on him for support. Thus the socialistic principle that every man ought to work for society according to his ability, but be paid according to his needs, is palpably unjust; and this of itself is sufficient to condemn the system, even if otherwise desirable.

It may be said, however, that all socialists do not hold the principle here attributed to them, but that some of their number would recompense every man "according to his deeds." It is admitted that this rule has some advocates among socialists, but its adoption in a socialistic state would be practically impossible. For in the first place, there is no means of ascertaining the value of a man's deeds, except by competition, which the socialists abhor. The only way to determine who are the most efficient servants of society is by giving each man a chance to do his best, and this means individualism, and competition among men for employment and public favor. But again, if it were practicable under a socialistic system to recompense public servants, such as all men would then be, according to their deeds, this would be directly opposed to the main object of the socialists, which is to abolish inequality. If men are to be paid according to their deeds—whether regard is had to the value of the deeds or to the difficulty of performing them—it is obvious that some men will receive a vast deal more than others, and this will bring back the reign of inequality. It is true that the more highly paid workers could not invest their earnings in the form of capital as they now do—they would spend them in personal enjoyment; but this would only make the inequalities more glaringly conspicuous. If one man received ten thousand dollars a year for his services and another only one thousand, the former would have his spacious mansion, his costly furniture, his luxurious dress and equipages, and all the pleasures that a large income gives, just as rich men do now; and the poorly paid man, if of an envious disposition, would feel the same jealousy and discontent that such men now feel. It would be impossible, therefore, in a socialistic state to adopt this method of payment; and thus there is no escape from the flagrant injustice of paying a man according to his needs, while requiring him to work according to his ability.

If, now, we consider our existing society, we shall find that in it men are recompensed for their labor, partly, indeed, according to their opportunities, but mainly according to their abilities. That this is true in the great majority of cases is certain, however strongly excited orators may assert the contrary. It is conspicuously true in the case of nations, whose differing prosperity and power is almost wholly due to

difference in their mental and moral qualities, notwithstanding the difference in their natural resources. It is also true in the main of individual workers of almost every class. The skilled and efficient laborer gets higher pay than the inefficient and the lazy, and the professional man higher pay than the ordinary laborer. So among capitalists and business managers the most successful are, as a rule, those who invest their capital most prudently and manage it with the greatest skill and discretion. Only the higher kinds of intellectual workers—the great thinkers, moralists, and others of that order—fail to get pay in proportion to their work; but their case is exceptional, and they are few in number.

"English as She is Taught."

NOTHING could be more amusing than the unconscious humor of "English as She is Taught," in this number of *THE CENTURY*, yet where is the thoughtful reader whose laughter is not followed by something very like dismay? Here are examination papers taken from many schools, evolved from many brains; yet are they so like in character that all might be the work of one puzzled school-boy struggling with matters too deep for him.

Undoubtedly many of these children have been poorly taught, and poorly taught in the same way, but the trouble lies back of indifferent teachers, and even back of indifferent or ambitious school-boards. It rests upon us all as a people. We are too heedless of detail, and too ambitious for number or size or appearance. We know too little of thoroughness; we demand impossible things; naturally, one of the things we get is the result embodied in "English as She is Taught."

Every conscientious teacher can tell how he is hampered by his overruling school-board or constituency. Sometimes it may attempt to guide; more frequently it suspects. His individuality is stamped out; his freshness of method and organization is distrusted. He knows that too many subjects are taught in a superficial, hap-hazard way, but he can make no change, for the genius of the people is against him. He knows that his assistants are working without adequate direction or organization; but his own hands are too often tied. Too often, too, the teacher is untrained and heedless,—often a mere sojourner in the school, preparing for other things; often the creature of a board dominated by a political or a sectarian majority. We need trained and enthusiastic teachers; unbiased, unpolitical, and carefully chosen school-boards; less ambition and more thoroughness; less of the *what* and more of the *why*; less immaturity striving to appear mature, and less ignorance masking itself under assurance. But the question arises: Who is to teach the American people this?

OPEN LETTERS.

International Copyright on Music.

OPINIONS OF AMERICAN MUSICIANS.

[IN THE CENTURY for February, 1886, was printed a collection of opinions from the most prominent authors of the United States, to the number of forty-five, on the subject of an International Copyright Law, contributed in response to a circular from us, and unanimously demanding such a measure, in the name of justice to authors and of an honorable public policy. In the following pages we print replies to a similar circular addressed by us to American musicians. It will be remarked that these responses, like those of the authors, recognize the preëminence of the ethical issue which is involved. Looking merely at the indifference of our legislators on this and other moral questions, one might think with Emerson that

"Things are in the saddle,
And ride mankind,"

were it not for the widespread and unsophisticated sense of right which is shown by such protests as these from authors and composers, who we are sure are in this matter the truest representatives of American sentiment. How long will it be before Senators and members will recognize that this is primarily a moral rather than an economic question; and that the conviction of large classes of thoughtful people that we are pursuing a disgraceful policy is a source of weakness in the national self-respect for which legislators individually are every day newly responsible? — THE EDITOR.]

AS TO an International Copyright Law, I should hail it with joy. At this stage of the world's progress such a legal protection should be everywhere recognized as an author's inalienable right.

BROOKLYN.

Dudley Buck.

THE artistic injustice to which composers are subjected for want of an adequate copyright law can scarcely be appreciated by the general public.

The recent litigation in regard to the original orchestration of Gounod's "Redemption," and of the Gilbert and Sullivan operas, developed the fact that it is the common practice to rescore, rearrange, reharmonize, republish, and otherwise maltreat, *ad lib.*, the works of any foreign composer that may be found profitable for trade purposes. So shameless has this practice become that the defendants in one of these lawsuits actually made a point of the fact that they had altered all the chords of the seventh in the original composition to common chords in their "edition" (!) and made claim to copyright on that account.

It is a notorious fact that American composers have suffered in the same way in England. The genuine creator in music may be content to wait for recognition, and may even be reconciled to having some one else reap the benefit of his artistic labor; but that any one should have the right to distort and misrepresent his works, which happens every day to *tone* artists, is a shame which no one can endure with equanimity. Common justice demands that the artist shall have the right to the fruit of his labor. *Artistic* justice demands that his creation shall be protected from dis-

figurement and vandalism, and *common law* as well as international law ought to afford such protection.

BOSTON.

G. W. Chadwick.

THE first thing to determine in regard to the lack of an International Copyright Law is not the injury it may be to American composers, but the injustice it inflicts on composers of all nationalities. The laws of all civilized countries recognize and protect the right of the inventor to the rewards of his ingenuity; the patentee of the most trifling mechanical contrivance, the compounder of the most impotent "cure-all," can at small cost secure the profits of his labor in every land; but the author, whether literary or musical, is not deemed worthy of the same just protection. His work, the result of years of labor, is — by a strange irony — deemed of so much value to the world at large that it would be an injustice to the world to expect them to pay him a fair price for it. He must be content, perforce, to find his highest reward for instructing or amusing the world, in fame, and — in filling the coffers of piratical publishers. So long as American publishers can republish the best class of music produced in Europe, without cost, except for stamping and printing, just so long they will refuse equally good compositions by native authors, unless they get them for nothing.

It would seem that the mere statement of the existence of such a state of things ought to be enough, in the name of justice and honesty, to end it, in spite of the "vested interests" — viz., publisher's capital, stock, etc., etc. — that are constantly referred to, when this question is agitated, as something too sacred to be meddled with; as if equity can or ought to recognize any "vested interests" in in-equity, or the success of never so many publishers outweigh the plain right of the humblest author to a fair share in the profit of his work.

UNIVERSITY OF PENNSYLVANIA, PHILA. H. A. Clarke.

THE absence of an International Copyright Law is working directly to the grave injury of our native composers. So long as American music publishers can reprint the most successful foreign compositions without paying a farthing of royalty to their authors, so long will they prefer doing so instead of printing American works of possibly equal merit. An International Copyright Law will encourage our composers by giving them a chance to see their scores printed. Surely, commercial equity and the interest of our musicians, nay, of musical progress among us, here go hand in hand. The absence of such a law benefits solely our music publishers; its enactment would remove one of the chief obstacles to our eventually taking rank as a musical nation.

BOSTON.

Julius Eichberg.

THERE is no need to argue at this stage of the controversy that copyright is property. The question at issue is now whether this property should have an international protection the same as the money a man carries abroad in his pocket. To reduce the matter

to a strictly logical basis, copyright is money. Any man possessing a copyright may sell it for what it will bring in the market, precisely as he would sell his railroad stock, or his old clothes—for there are copyrights which are worth little more. The question is, shall civilized countries recognize these facts and give copyright an international safety, or shall the inhabitants of each country still have the privilege of poaching on the mental products of other countries at their pleasure? American composers have so far had a hard time of it, and have found it a very difficult matter to introduce their works to their own countrymen. Nor is this so much to be wondered at when it is remembered that in the present state of lawlessness any publisher here can issue cheap reprints of any foreign composition at any time when he may choose to do so; he merely pays for the plates, the paper, and the printing, the composer, of course, receiving nothing. This is certainly very agreeable and nice—for the publisher; but it naturally puts American composers in the shade. Lastly, it must not be overlooked that an International Copyright Law would not only be a matter of justice, but also a stimulus to mental activity, and it would certainly tend to discourage robbery whose chief excuse seems to be that it is wholesale.

NEW YORK.

Otto Floersheim.

JUSTICE and expediency alike demand an International Copyright, and every educated person in the country should ask for it.

One example of the result of the present system of piracy is worth more than any amount of argument. Three years ago, in Paris, I saw a man whose music is admired and loved wherever the pianoforte has made its way,—Stephen Heller,—old, poor, and almost totally blind. If the money justly due him from publishers in the United States alone could have been made his by law, he would have been made comfortable for the rest of his life. Fortunately his friends in France and England raised an annuity for him, and so in part made up for the wrong; and his is the case of many. No American who lives wholly or in part by the work of his brains should rest until that work is as much protected as a brand of whisky or soap.

BOSTON.

Arthur Foote.

IN observing that in the United States the author and musical composer alone are left unprotected by the law, one might be inclined to think that America's great law-makers had all been publishers! Luckily it is otherwise. Nevertheless, so long as there is no international copyright, "*Fiat justitia, ruat cælum*" will remain in American translation: Enrich the pirates; authors may starve!

NEW YORK.

F. Korbay.

WHILE the present wrong state of affairs causes more injustice to European authors and composers than to Americans, it will not be long before the latter will begin to suffer more or less acutely. It may be that for many years musical composition here will bring no pecuniary reward (so far as regards the higher forms), but without an adequate international copyright this condition might exist forever.

An American composer now has to contend against

the tremendous competition that is caused by the fact that our publishers reprint, without the cost of authorship, works of every European composer of reputation. It is not only against such works themselves that our composers must measure themselves—they must face a surfeited market; surfeited, because his works have but one publisher, while the others have all. The publisher has little reason to pay for what he can get for nothing. It seems to me that there is no honorable defense for our present thievish attitude on the subject of international copyright.

BOSTON.

B. J. Lang.

IT seems to me that every right-minded person must most emphatically condemn the unprincipled piracy of literary, and especially musical, works, that has been continued for so many years. Why should not the products of a man's brain be as much his personal property, and therefore protected by law, as his money or anything else belonging to him? If an American appropriates an Englishman's money and is caught, he is punished; if he appropriates his book or musical composition, republishing and selling it for his own profit, he goes free. Such a state of affairs is so entirely opposed to all principles of modern civilization, that there cannot and should not be two opinions on this point. Let us have an International Copyright Law, by all means, and the sooner the better.

BOSTON.

Louis Maas.

MANY pianoforte and other musical compositions by Americans are at present constantly being republished in foreign countries and ordinarily without remuneration to the composers. It seems to me that the arguments in favor of International Copyright as regards works of literature, apply with equal force to musical compositions. I should, however, prefer what the Rev. Lyman Abbott, in *THE CENTURY* for February, 1886, calls "Universal Copyright,"—not as a matter of policy, but because of its broad and more liberal scope and because founded upon principles of honesty, equity, justice, and humanity.

ORANGE, N. J.

William Mason.

IT has been said that there are two sides to every question, but from the author's and composer's standpoint there is in the copyright question only one side which contains the elements of justice.

The consuming public naturally desires to have the advantage of reprints of foreign matter, and for this advantage ought to be willing to pay a price by which the originator, who has given his time for their enlightenment or enjoyment, should derive some benefit.

Without an International Copyright we shall never develop to any extent the literary or musical talent which is lying dormant in this country; for so long as we can have the vast resources of European countries to draw upon without taxation, so long will our native authors and young composers be deprived of a working-field, and we who boast of equality in all things will have to acknowledge the superiority and supremacy of other nations in literature and art. For no enterprising American, no matter how much genius he may possess, will wholly devote his time and talents to work from which he can derive no profit

owing to the concurrence of publications by foreign authors which can be reproduced here without paying any royalty, and consequently at less expense to the publisher.

NEW YORK.

Harrison Millard.

MY name is at your service to help swell the number of petitioners for the passage of an International Copyright Law. In spite of my honest endeavor to find out the injury done to American composers by the absence of such a law, I must confess my inability in this direction. My only feeling is, that moral justice ought to be done to the right of property of the brain as well as to that of the purse.

NEW YORK.

J. Mosenthal.

EVERY American composer will rejoice when an International Copyright Law is adopted in this country, whereby the right of an author to legal protection for his published works is recognized as universal. The absence of such a law is not only a grave injury to foreign masters, but a fatal obstacle in the path of our own composers.

CAMBRIDGE, MASS.

John K. Paine.

ALL the arguments advanced in the controversy regarding an International Copyright Law for the protection of authors are equally applicable in the case of composers. Speaking from the standpoint of an American composer, the musical market is flooded with cheap reprints of the most popular and profitable modern European works, to the great detriment of American compositions of merit. These cannot of course compete with works of foreigners in price, since the publishers not only may, but do, take without remuneration and use with impunity what ought to be the property of foreigners. For no long argument is needed to convince any right-thinking man that the result of brain-labor is as much the maker's own property as the work of his hands. Moreover it is a melancholy fact that there is in this country at present a prejudice against American music. Given two piano-pieces of equal merit, one by an American, the other by a foreigner, probably not one teacher in ten would give preference to the former for constant use. The passing of this law would give to American composition an impetus and encouragement which it greatly needs, by tending to place the American composer, at least at home, on the same footing as the foreigner.

The whole question seems naturally to resolve itself into one of simple morality: Has a man the right to the product of his work? It is unreasonable and selfish to expect a composer, after he has labored for years and spent both time and money to acquire his ability, to use that ability merely to enrich the man who buys the paper and has it printed; while he himself who has created something to print is forced to subsist by other means, although by appropriate legislation there could be secured to him a just proportion of the fruits of his toil.

GARDEN CITY, L. I.

H. W. Parker.

IF it be obvious justice to a literary or artistic worker to afford him copyright protection in his own country, it is equally obvious justice to grant him similar protection in all countries that are linked with his own by likeness of knowledge and taste. Upon

general principles of fair dealing, therefore, I believe heartily in an International Copyright Law, and in a law that shall apply to musical compositions as well as to books. Hitherto, the absence of an International Copyright Law has been an injury and an injustice mainly to *foreign* composers and publishers. But within the last ten or fifteen years American music in all departments from the primary instruction-book has been commanding more and more attention in Europe, so that the evil is beginning to be felt keenly on our side also. This reciprocity of interest is certain to become rapidly more noticeable. The sharp goad of personal interest is thus being added to the slow sense of abstract justice to make most American musicians decided advocates of the International Copyright idea. It is surely disgraceful that the United States is one of the last of the great powers to accept and adopt this idea.

HARTFORD, CONN.

Waldo S. Pratt.

LAST summer I looked into the musical catalogue of the British Museum for English reprints of American music, where every publisher in England is expected to deposit a copy of every publication he issues, to be catalogued and kept for reference. This I did at the suggestion of a London publisher who favors an International Copyright Law, and who wished to give me an idea of the loss I have sustained by the absence of such a law. This catalogue consists of blank-books into which are pasted the titles of each author's compositions, so arranged that they are kept together and in alphabetical order and four or five on a page. My list, beginning back in the Fifties and taking in the war songs on their way to the present time, occupies twenty-three of these pages and a part of the twenty-fourth. This does not include a good many singing-class pieces and some Sunday-school and Gospel songs that appear in books by English compilers. It goes without saying that I favor an International Copyright Law.

CHICAGO.

Geo. F. Root.

ON most subjects there may be diversity of opinions. On the subject of International Copyright it seems to me there can be but one view, and that in favor of security to American writers, and, I may say, to all writers. As a composer of music who is, fortunately, not dependent on the material result of his publications, I do not fail to appreciate the fact that music publishers in this country have no paramount interest to push the sale of their copyright publications. The reason is, they can reprint with such facility the works of others *after* they have proved a success, and it pays them so much better to do this because they are not hampered by royalties or bonuses to European composers; thus they have not the same incentive to further the sale of their publications which English, French, or German publishers have. A successful American composer, whose works do not aspire to so-called cheap popularity, does better to-day, from a pecuniary point of view, to publish his works in Europe than in this country. This is not as it should be. It is time that wholesale stealing of, or simply voluntary payment for, the productions of the brain should be stopped.

NEW YORK.

Sebastian B. Schlesinger.

INTERNATIONAL Copyright is a legitimate and logical extension and application of the principles involved in our present copyright laws, and secures to the author, dramatist, or composer full and perfect recognition of property rights, in place of the partial and imperfect protection afforded by existing laws.

That our statutes signally fail to furnish to literary workers that security in the pursuit of an honorable calling to which every citizen is entitled, must be conceded, and the injustice of further delay becomes more apparent, in view of the fact that the advocates of purely material issues rarely fail in securing favorable legislation.

The comparative ease with which musical productions are reprinted, and the fact that the medium of expression is the same in all countries, render the native composer subject to a competition even more intense than that which literary workers are obliged to endure. It must be borne in mind that at the present time, when American composers are beginning to assert their right to a respectful hearing, this burden is especially hard to bear. It is significant that the association (Music Teachers' National Association) which has done more than any other agency to arouse an interest on the part of our musical public in the work of our native composers, has repeatedly and emphatically indorsed the principle of International Copyright. It was the good fortune of the writer to assist in securing an expression of opinion from the musical profession upon this question, and the unanimity with which the better class of musicians indorsed the proposed legislation proved conclusively that its necessity was fully appreciated. The manly spirit shown in demanding fair play for the foreign composer, while insisting on just treatment for themselves, indicates a self-respect which may prove no unimportant factor in developing American musical art.

PROVIDENCE, R. I.

Albert A. Stanley.

WHEN a young artist, or an old one for that matter, carries to the publishers a work that will compare in usefulness as well as excellence with any contemporaneous production, he is met by the question, "What is the use of my buying a MS. from you when I can get the compositions of Sullivan, Dykes, Goss, and all the best English composers for *nothing*?"

The English music unquestionably has done much good here in arousing the latent talent and energies of our American composers. We awake only to find that we have been aroused in vain. There *must* be an International Copyright, and that without delay, or American music will sink into oblivion. If any considerable number of our Congressmen knew anything about art or literature, we should have had it long ago.

NEW YORK.

Eugene Thayer.

THE present state of the law is an inducement to swindling and is degrading to us as a nation. An International Copyright Law that would compel American publishers to pay foreign composers for their works might also prove an encouragement to home talent by giving our own composers an equal chance with others.

NEW YORK.

Theodore Thomas.

I AM most decidedly in favor of an International Copyright Law, by which musical composers and authors in other arts and sciences will be protected against the outrageous doings of many publishers in America and in Europe. A man's brain-work should be respected by all, and every profit and advantage that may be gained through it should be for his own benefit, and *not* for those who furnish the paper and the ink for the reproduction of works which in most cases have taken years of study and hard labor to conceive and to execute.

BOSTON.

Carl Zerrahn.

COMMENT OF A CRITIC OF MUSIC.

THE musicians whose appeal for International Copyright is published in this number of THE CENTURY have in one respect a stronger claim upon the protection of their country than even the writers of books. The author of a literary work is exposed to the direct competition only of those who use the same language. But the language of music is universal; and the American composer of songs, cantatas, and operas must face the fact that the publishers of whom he asks pay can take without pay the productions of Germany, France, Italy, Hungary, Russia, and Scandinavia, as well as the countries of the English tongue. They can pillage the whole world. This is one reason why American music gains so little headway. Our historians, novelists, and poets by pluck and ability are beginning to make a scanty living; but American music, on its creative side, remains very nearly where it was a generation ago. An American cannot earn bread by composing music. The law shuts him out of both foreign markets and his own; and yet music of a high class needs the markets of all countries, because its sale, under the most favorable circumstances, is so much restricted by the difficulties of performance. We pride ourselves upon our progress in the execution and appreciation of music; but while we boast of our culture we starve the creative spirit of art, and fill our dishonored halls with ill-gotten spoils from every land where we can find anything to steal.

The Hawley Bill, supported by the American Copyright League, during the last Congress proposed a simple measure of reciprocity, placing upon a perfect equality with our own citizens, as to copyright, the citizens of every nation which should grant a parallel equality to Americans. Interesting and forcible arguments in behalf of the reform were made by Mr. Lowell and others before the Senate Committee on Patents; but to the general disappointment the committee reported a bill devised by one of its members, Mr. Chace, which nobody seems to have asked for, which authors and composers certainly do not want, and which virtually denies the principle upon which International Copyright is demanded. Whether we rely upon the moral or the economical argument, the paramount object of an International Copyright Law is to protect the creators of intellectual property against unauthorized reprinters of it. But Mr. Chace, in reporting his bill, declared in effect that his paramount object was to protect the interests of reprinters, and that he should consult the property rights of foreigners only so far as he could do so without injury to our

material profits or the "income of labor." As for the property rights of American authors and composers, he did not consult them at all, for he left out of his scheme the reciprocity clause, which was an important part of the Hawley Bill. What he did was to offer a foreigner copyright in this country provided he got out an American edition, printed here within three months of the original publication abroad. This condition failing, the copyright was to lapse permanently, and piracy to be free. In the meanwhile, and as long as the copyright lasted, the importation even of a single copy of the work was to be prohibited. The author could not send it to publishers with whom he wished to treat, and if he came to the United States he could not bring a copy with him. Take from the three months the time necessary for the shortest correspondence across seas and the time required for re-manufacture, and how much is left for negotiations? Our foreign friend's dealings with the American reprinter must be quick and sharp. This man of business has the game in his own hands. "Give me your work at my price," he can say; "it is too late to try another house. In a few days your privilege of copyright will lapse, and then I can have your production for nothing." So instead of protecting literary property, Mr. Chace has only invented a plan by which the "vested interests" concerned in reprinting can protect themselves against the competition of rivals in the business, whenever they think it worth while to pay something for that advantage. Authors of established fame and popularity can indeed make their own terms; but in the case of nine writers out of ten it would be optional with the reprinting firms, under the Chace scheme, to allow copyright or not. The time clause, which takes away a man's rights unless he can sell them by a fixed day, makes the buyer master of the trade. The situation is not essentially changed by the fact that authors might sometimes make their bargains here before the publication abroad. They could not always do that. In many cases the success of a work depends upon the haste with which it is put to press, and the manuscript must be given to the printer as fast as it is produced. And in dealing with all but the foremost authors and composers, it is probable that the "vested interests" would generally elect the piracy system, so that they could test the market for a work abroad before risking its republication in America. This would be the rule especially with musical compositions, the popularity of which cannot be judged until the public has had ample time to hear them.

The Chace Bill, therefore, does nothing for the protection of American authors and musicians abroad. It does so little for them at home that the relief is hardly worth considering. It violates the moral principle of copyright for the benefit of the capital invested in piratical reprinting; and it assumes that our paramount duty is to protect manual labor even to the extent of stealing the raw material for it to work with. This is the measure which the report of the Senate Committee on Patents has placed before the country. The American Copyright League is now striving to have the Hawley Bill reported also, that the people may judge between them. The contrast would be instructive. To show the difference between a bill for the protection of literature and art and a bill for the

protection of the vested interests employed in plundering literature and art is a telling argument for honesty.

John R. G. Hassard.

General Shields.

TO THE EDITOR: As a friend of the late General Shields, who has intimately known him from the time he made his first appearance in Illinois until his death a few years ago, I trust to your known impartiality for allowing me to make a few observations on the harsh judgment which the biographers of President Lincoln have passed on the character of General Shields in the January number of *THE CENTURY*.

Shields, while under age, came to this country, either at the instance or under the auspices of an uncle who settled in South Carolina. After reaching manhood he went North teaching school,—the beginning of so many of our most distinguished politicians and even statesmen. In 1835 or 1836 he opened a school at Kaskaskia which, though it had ceased to be the capital of the State, was still the residence of a highly intellectual and polished society. There lived the families of Elias K. Kane, then United States Senator from Illinois; of the eminent Judge Nathaniel Pope, United States District Judge; of the able lawyer David J. Baker, of William and Robert Morrison, of Governor Menard, of the Maxwells, and of many other prominent citizens.

General Shields had not received a thorough classical education; but he had some knowledge of Latin and French. He was an excellent English scholar, familiar with the best literature of England and America, and had a more than usual knowledge of history, particularly of that of modern times.

He was quick of perception, lively in conversation, ardent but by no means as touchy and irascible as the biographers represent him. His vanity was indeed inordinate, really so much so that it rather became amusing than offensive. The best evidence of his being an honorable gentleman and a man of superior parts, was that he was most kindly received and made much of in the families I have mentioned. Judge Pope was his most particular patron and spoke kindly and highly of him to the day of his death. Judge Breese, who had, however, left Kaskaskia shortly before, became well acquainted with him somewhat later, on the circuit, and formed as much of friendship for him at that time as lay in his nature. And what is a most remarkable circumstance, all these Kaskaskia people without exception were strong Whigs, while Shields was a Democrat, though never a radical one. He did not seek to rise in his party, as a great many men of small caliber do, by professing ultra views, and to a certain extent he even despised popularity.

There was a special session of the Legislature called in 1837 owing to the suspension of our banks and to the embarrassment growing out of the monstrous system of internal improvements shortly before adopted by the State.

In the representation of Randolph County a vacancy had taken place, and Shields, though a Democrat, was elected in a county then largely Whig, he receiving the support of Judge Pope, David J. Baker, and other leading Whigs. Hardly any Irishmen were then living in that county. It was largely inhabited by French people, amongst whom Shields was always well liked

for his vivacity and probably also for his knowledge of their language. Surely he was not put up as a candidate on account of his "nationality." In the Legislature he made many warm friends and was considered an able reasoner and debater. He had studied law probably before he came to Illinois, continued it here, and was in fact very well grounded in the principles of law—rather more so than most of his rivals then at the bar. He argued closely and to the point, was much stronger before the court than before the jury, as he had not the gift of the gab, and hardly ever tried to be rhetorical or pathetic. When he did try, it was generally a bad failure. His language was always chaste and grammatically correct. He had a subtle and logical mind, though his impulsiveness made him sometimes act very illogically. He was ambitious, so much so that many people judged him to be too selfish. I, however, know of a great many instances when he acted very generously, and forgetful of himself. Very few ambitious men are free from the charge of egotism. He was careless about money matters and not the least avaricious.

In 1837, at the instance of the late A. W. Snyder, then a member of Congress, who had taken a great liking to Shields, he settled in Belleville, Illinois, as a lawyer, and, forming a partnership, entered on a very successful practice. Traveling the then very large circuit, he became well known in all southern Illinois, and his sociability, warm temperament, sprightly and intelligent conversation made him hosts of friends. While he himself delighted in being flattered he took occasionally good advantage of the same weakness in others.

In Belleville he soon made many friends, particularly amongst the educated Germans, who found his conversation interesting and cosmopolitan. There were few Irishmen then in that county, and he was not particularly popular amongst those few.

His election for State Auditor in 1840, by the Legislature, was owing to the fact that he knew most of the members personally, to his social qualities, and to his reputation of an able and honest man. It is just barely possible that his nationality may have had some influence with some of the politicians; but it was his tact, and the friendship of Douglas, who was then Secretary of State, and of other leading Democrats, such as General Whiteside and Colonel W. H. Bissell, late Governor of Illinois, that made him successful.

As regards the contemplated duel with Lincoln, the biographers remark very rightly: "We have reason to think that the whole affair was excessively distasteful to Lincoln. He did not even enjoy the ludicrousness of it, as might have been expected." It could not fail that the noble-hearted and eminently just Lincoln would, as soon as he was out of the hands of his ill-advising *friend*, most deeply regret this episode of his life.

The articles, for which Mr. Lincoln had made himself generously responsible, "covered," as the biographers themselves say, "Mr. Shields with merciless personal ridicule." But they also charged him, together with Governor Carlin and Treasurer Campbell, who had instructed the Collectors of the State revenue not to receive the almost worthless bank paper for payment of State taxes, with the most sor-

did motives. No man of the least spirit could have taken those insults without seeking satisfaction, even by arms, if necessary. Dueling, particularly amongst public men, had at that time not so much faded out of fashion, either in England or in our country, as at present, and is not yet sunk into entire oblivion. The provocation was of the strongest, and no blame attached to Shields at the time. It is no proof of Shields's irascibility. He was a young man who had his reputation for honesty at stake; and to have in addition his personal features and peculiar habits ridiculed in a small but select society in which he daily moved was more than even a saint could have borne. But there was another reason why, as the biographers say, "Lincoln would have been glad to banish the matter from his memory." Both parties had been very unfortunate in the choice of their "*friends*." General Whiteside was a very brave man; he had seen some service in the Black Hawk war, and was a good Indian-fighter. But he was no better qualified to manage an "affair of honor" than Black Hawk himself. Whatever the pretensions of Dr. Merryman might have been, he certainly was equally ignorant of the "code of honor," the first and foremost rule of which is that the combatants should, as much as possible, meet on an equal footing. Air and sun must be equally divided. Mr. Shields was just about of medium height, of light weight at the time, by no means strong; while Mr. Lincoln was of towering height, heavy, and long-armed, and of almost superhuman muscular strength. In this respect the choice of arms, "cavalry broadswords of the heaviest caliber," undoubtedly suggested by the Doctor, was an unfair one. The only excuse for him, and after all a bad one, might have been this, that as a friend of Lincoln he wanted to prevent a duel at all, and so he would propose such a sort of a fight as would bluff off Shields. But if he thought so, which is a mere surmise of the writer, he did not know the man Shields. But it would have been the duty of Whiteside to decline peremptorily such a combat, and to insist on pistols, a weapon with the use of which both parties might have been supposed to be somewhat acquainted, or with which by a few days' practice they could have familiarized themselves. Another rule of the code is that no unusual weapons must be used. Now, outside of army officers or students on the continent of Europe who are more or less trained in fencing-schools, the saber, or even the small sword, is never resorted to in dueling, and even with those classes pistols are the more customary arms. Amongst civilians it is an unheard-of thing. I am almost sure that Mr. Lincoln never before had handled a heavy cavalry sword; I am certain that Shields never had. If the duel had taken place, it would have been a ludicrous as well as a brutal affair. In the hands of novices a somewhat crooked heavy cavalry sword becomes no better than a flail or a stick. The strokes intended to cut head, shoulder, or breast in nine cases out of ten fall flat, and may knock a man down without ever drawing blood.

The blame of this opera-bouffe affair falls properly on the seconds. It is plain, however, that none attached to Shields.

The letter to Judge Breese referred to is clearly indefensible. It was the worst mistake in Shields's life, though, strange to say, it did not hurt him with his con-

stituents; for while he was rejected by the Senate on account of lack of constitutional qualification when he first offered himself in March, 1849, the moment that disqualification ceased, October, 1849, he was reelected Senator by the Legislature, called at a special session for that purpose.

He seemed to have lost his head entirely on that occasion. He had been naturalized in 1840, in September, I believe. At the December session of Congress, 1849, he would have been a citizen of nine years' standing. But he hastened to Washington soon after his election, and presented his credentials in the Senate, which had been called for an extra session for Executive purposes after the 4th of March. An objection was made to his qualifications and sustained. The letter was written to frighten off Judge Breese from having the objection raised. Whatever his motive he committed an abominable error.*

When in 1844 Governor Ford appointed Mr. Shields one of the Judges of the Supreme Court to fill a vacancy, it was surely not on account of his being an Irishman. Ford was not that sort of a man. He never cared about popularity. He only looked to the qualification of his appointees. Shields filled the office to the satisfaction of the people, and the few opinions he wrote during his short stay on the bench are lucid and forcible.

As Logan in the civil war, so Shields in the Mexican war, was the most distinguished volunteer general. Severely wounded, when leading his Illinois Brigade at Cerro Gordo, he led the Palmetto and another regiment with distinction at Contreras, and received at the storming of Chapultepec a most painful and slowly healing wound in his right wrist. In the civil war he was again wounded in the arm by a ball at Winchester. He was not a great strategist, nor even a tactician; but he was always found in front, and the soldiers liked to follow him.

He may in older days have indulged too much in reminiscences of his former feats of arms, but there are few old soldiers who are not guilty of such a charge. The writer was very near him for several years after the Mexican war, and is not aware that he ever unduly prided himself on his military performances.

He was naturally very much opposed to slavery. It was with great reluctance he voted for the Kansas-Nebraska bill. But Mr. Douglas, his colleague in the Senate, had much influence over him, Douglas having always nobly supported him. He had taken the view which Mr. Webster had promulgated in his celebrated speech, that slavery could not exist in either of the territories, from climatic and other causes that nature had ordained, and that therefore the repeal of the Missouri Compromise could do no harm.

Earthly goods he never acquired. Before the generosity of Congress, not long before his end, relieved him, he spent many years in actual poverty. His mind, while eccentric, sometimes erratic, was essentially of a lofty nature. He could not have risen to all the high

stations he filled except by some intrinsic merits. Were it otherwise, not he, but those who elected him, would have to bear the blame.

BELLEVILLE, ILLINOIS.

Gustav Koerner.

The Cantata and American Composers.

BY using very little of your space may I try to modify the impression which the letter on "The Cultivation of the Cantata" published in the January number of THE CENTURY has probably made? When Mr. Barnard, after saying that the cantata occupies a middle ground between the oratorio and opera, that American writers have been more successful in this form, cites Mr. Root's "Flower Queen" as an example, I am led to believe that he is not informed of the present trend of American music. To encourage Americans to compose is a leading topic among writers on music at the present time in the United States, and the cantata is one of the most desirable forms to have cultivated; but have we not outgrown the era which accepted the compositions of Mr. Root as standard in that department? Would the Handel and Haydn Society pay one thousand dollars for the counterpart of "The Haymakers" or "Esther"? Certainly it would not. Mr. Barnard, however, implies that it would, and the non-musical reader of his letter will seek for no higher values in this form of native musical achievement than these compositions represent. Such pieces are styled cantatas. So is "Pinafore" an opera, but "Orpheus" is one also. There was a time when practice of "The Haymakers" and "The Flower Queen" in uninformed and slow-moving districts was quite general; clergymen recommended such to their Sunday-schools; but the men who at present are writing what is making a name for American music did not so much as taste this fount of inspiration.

I would mention George E. Whiting and his "Tale of the Viking"; W. W. Gilchrist and his "Forty-sixth Psalm"; Dudley Buck and his "Golden Legend" and "Columbus"; Arthur Foote and his "Hiawatha"; H. W. Parker and his "King Trojan"; G. W. Chadwick and his "The Viking's Last Voyage"; Prof. J. K. Paine and his "The Nativity"—these men *are* cultivating the cantata. Certain of these compositions were written under such conditions as Mr. Barnard recommends. I do not take issue with Mr. Barnard's idea; I uphold that. We diverge at what constitutes the cantata. A retrograde movement among writers of music in the United States would be deplored on every hand. There is already plenty of music among us, suited to uneducated taste and an unfiltered desire for tune. Composers of this sort of music may not do very much harm; but theirs is not the best music of which Americans are capable. It is to establish this fact and show the general reader that there is already grounded among native writers a style infinitely better, the product of real art, that this letter is ventured.

BOSTON.

George H. Wilson.

* Another correspondent (Mr. R. I. Holcombe) interprets the expression in the letter to Breese, "he should never have profited by his success," to mean merely that he would represent the means employed by Breese to achieve success in such a way to his associates at Washington that his influence would be seriously impaired, if not destroyed. It should be said, however, that our

correspondent does not explain the context.—Mr. W. J. Onahan also writes to us in praise of General Shields, calling especial attention to General Scott's testimony as to his gallantry and efficiency in the field; as well as to some cordial words spoken in his behalf by General Logan.—EDITOR.

BRIC-À-BRAC.

Uncle Esek's Wisdom.

SOME people's virtues sit upon them as their clothes do,—they look as though they pricked dreadfully.

THERE are successes that are far more humiliating than defeat.

NOTHING to do wears out a graven image in the course of time.

I BELIEVE in dispensations, but when a man gets drunk, falls down the cellar stairs, and breaks his neck, I lay it to the whisky, not to the dispensation.

HE who is ashamed of his poverty would be equally proud of his wealth.

Too often love is nothing more than self-love in disguise.

WE are all very proud of our reason, and yet we guess at fully one-half we know.

Go slow, my friend ; you have time and eternity both before you.

Uncle Esek.

Her Photograph.*

A PICTURE of a dark-eyed girl
With pensive, thoughtful air,
Whose pure sweet face looked from beneath
Its frame of misty hair.

My heart was captured by her face ;
I loved her at first sight :
"Sweet maid," I whispered, "let me be
Your own true chosen knight."

And then I tried to find my queen,
I sought her near and far ;
Her pictured face shone on my path
And was my guiding star.

But oh, how can I tell the grief,
The bitter grief to me,
When I found out, beyond a doubt,
There wasn't any *she* !

For this sweet picture that I loved
(Kind reader, do not laugh !)
Turned out to be a very good
Composite photograph !

And the fair girl whose pensive eyes
Had made my pulses stir,
Did not exist, or rather there
Were forty-nine of her !

One woman's face was in my mind —
How could I then divine
That I, while faithful to one love,
Was true to forty-nine ?

O Science ! You have done this thing,
On you I lay the guilt ;
You've made my honest love appear
Like any crazy quilt !

And this one thing I ask of you,—
Can you, with all your art,
Unite these forty-nine poor bits
And give me back my heart ?

Bessie Chandler.

An April Answer.

I ASKED her for her photograph ;
She answered, with a lightsome laugh,
"I'll send you one on Friday week."
Emboldened by her gracious mien
(For I am young and somewhat green),
My ardor spurred me on to speak.

(But, gracious ! means I find are used
To leave a lover quite confused)
She smiled and whispered, "Can't you guess ?
My picture shall my answer give."
To-day she's sent her negative,
Marked "April First." Does that mean "yes" ?

Anna M. Pratt.

Development.

ONE morn a bud beside my window came,
And leaned beneath the frame ;
The soft air, sunshine, and nocturnal dew
Nourished it, and it grew.

And so the bud became a half-blown rose
(Sweeter ne'er grew, nor grows) ;
And blushed and laid its cheek against the pane
Till kissed by summer's rain.

And now it blooms (the kiss has done its part,
Laid open the gold heart),
And in morn's sunshine and the dew of even
Sends fragrance up to heaven.

Maud Kalbfleisch.

A Fortunate Parallel.

(Suggested by "A Story of Seven Devils.")

"YES," she admitted, "it's very clever,
And I like Frank Stockton as much as ever.
It is well for us all to find our levels ;
It's a little extreme, though — *seven* devils !

"Some people, you know, don't believe in any ;
To those, it will seem, perhaps, too many ;
But to others as easy to grasp as one ;
'Begun is,' the proverb says, 'half done.'

"Oh yes, I've heard several women rage ;
He meant that they should ; for I'll engage,
From the feeling manner in which he wrote,
He had 'found,' and had merely to 'make a note.'

"And you wonder to see me keep so cool ?
No — I'm not his friend, the 'absolute fool,'
But, to be quite frank, since you wish the reason,
It's a bit of ancient history treason.

"It constantly keeps me nice and calm ;
It's in the 116th Psalm.
To be sure, it was said 'in haste,' but so
Is much that is very well said, you know.

"And, so far as my observation goes,
This hasty statement about his foes —
And friends — which King David gave for fact,
He never found leisure to retract."

Margaret Vandegrift.

* See "Composite Photography" in THE CENTURY for March.
